THURINGIA, thū-rīn'jī-a. A Free State of Germany formed, on Dec 24, 1919, by the union of the following states: Saxe-Weimar, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sonderhausen, Saxe-Gotha (Coburg had merged with Bavaria), Reuss (formed on Apr 4, 1919, of the two Republics of Reuss). Total area, 4669 square miles; population in 1925, 1,607,339. Principal towns with their 1925 populations: Weimar, the capital, 45,957, Gotha, 81,402; Gotha, 45,780, Jena, 52,649. The German Reich, on Apr 30, 1920, recognized the union as being consonant with the provisions of Article 18 of the new German constitution of 1919. Elections to the first Diet of Thuringia were held in June, 1920, and this body, on Mar. 11, 1921, adopted the constitution which a Volksrat, or People's Council, made up of representatives of the old legislatures, had drawn up. Like the other states of the Reich, Thuringia has a single-chamber Diet elected by proportional representation. The executive power is vested in a ministry elected by the Diet and made up (1925) of five ministers with portfolio and three

councilors of state (without portfolio). There is no president. Legislative power is in part delegated and in part directly applied, for the electorate may exercise the initiative and referendum. In 1927 there were produced 130,363 tons of wheat, 108,245 tons of rye, 160,338 tons of oats, and 988,433 tons of potatoes. In the same year, nine plants produced 3,470,020 tons of potash. In 1928 there were 182,536 elementary school pupils, 23,211 pupils in private schools, and 76,081 pupils in continuation schools. The ordinary budget for 1928 provided for revenues and expenditures of 129,601,900 marks. See GERMANY.

THURSTON, E(RNEST) TEMPLE (1879-). An English novelist, born at Halesworth. At the age of 16, he published two volumes of verse, and his first novel, *The Apple of Eden*, was published in 1905. His writings include *Traffic* (1906); *The Realist* (1907); *Sally Bishop* (1908), *The City of Beautiful Nonsense* (1909); *The Greatest Wish in the World* (1910); *The Garden of Resurrection* (1911); *The Antagonists* (1912), *Richard Furlong* (1913); *The Passionate Crime* (1915); *The Five-Barred Gate* (1916); *Enchantment* (1917); *The World of Wonderful Reality* (1920); *The Green Bough* (1921), *The Eye of the Wist* (1922), *May Eve* (1924), *Mr. Bottleby Does Something* (1925); *The Rosetti* (1926); *Come and Listen* (1927), and *Portrait of a Spy* (1928). His plays include *The Greatest Wish* (1912); *Driven* (1914), *The Cost* (1914); *The Wandering Jew* (1920); *A Roof and Four Walls* (1923), *Judas Iscariot* (1923), and *The Blue Peter* (1924).

TIBET, tī-bét'. A Chinese outer territory, with an area of 463,200 square miles, and a population estimated at from 2,000,000, to 6,000,000. Lhasa, the capital, had from 15,000 to 20,000 inhabitants in 1929. Agriculture is carried on, but only to a slight extent because of the difficult topography. Pastoral pursuits are more common. Communications, by means of caravan, are maintained with China and India, an active barter in tea, silks, cotton goods, carpets, leathers, dried fruits and household utensils for the native wool, fox skins, musk, salt, and borax, being prosecuted. The British penetration, actuated by a desire to establish relations between India and Tibet and to reach southern China, continues. The political situation remains anomalous. The Chinese government's refusal to accept the terms of the Simla agreement of 1914 which provided for an autonomous Outer Tibet and an Inner Tibet ruled from Peking, and the continued demands of Tibetans for independence, brought about a state of suspicion and hostility which broke out into open war in 1917. Tibetans marched on Chamdo, claimed for both Outer and Inner Tibet, and took it in 1918. An armistice followed, and in the next year the Chinese displayed their desire for peace by proposing a renewal of treaty discussions; but the Chinese government showed its weakness by its inability to put down native uprisings in Inner Tibet, while Great Britain's interest in safeguarding the Indian frontier complicated matters. It is evident that Outer Tibet has practically become a dependency of Great Britain. The Dalai Lama remains at the head of the native government.

TICK ERADICATION. See VETERINARY MEDICINE.

TIDAL THEORY. See ASTRONOMY.

TIETZE, TIANS (1880-). An Austrian professor and art historian, who was born at Prague and educated at the University of Vienna.

After teaching art in various capacities at the University of Vienna, he was from 1919 to 1925 head of the museum department of the Austrian Board of Education. He wrote *Methode der Kunstgeschichte* (1913); *Albrecht Altdorfer* (1923), Vienna, as a centre of art (1918, 1923, 1927), *Der junge Durer* (1928).

TIFFANY, LOUIS COMFORT (1848-). An American artist (see VOL. XXII). He established the Louis Comfort Tiffany Foundation for art students at Oyster Bay in 1918 and gave it a \$1,000,000 fund, the income from which was to be used for maintenance and operation. The Foundation consisted of his country home, the Museum, Tiffany Chapel, and over 60 acres of land, and he deeded to it his entire collection of paintings, glass, and other art objects. He was awarded gold medals at the Panama-Pacific Exposition in 1915 and the Philadelphia Sesquicentennial in 1926.

TIGERT, JOHN JAMES (1882-). An American educationist. He was born at Nashville, Tenn. (a son of Bishop John James Tigert of the Methodist Episcopal Church, South), and received the degree of B.A. from Oxford University, Eng., as the first Rhodes Scholar from Tennessee (1907). After serving as professor of philosophy at Central College, Mo., he became president of Kentucky Wesleyan College at Winchester (1909-11). He then held professorships of philosophy and psychology at the University of Kentucky (1911-21). From 1921 to 1928, he was U. S. Commissioner of Education. Since July, 1928, he has been president of the University of Florida. During the World War, he went to France with the Y. M. C. A., was with the Army Educational Corps, A. E. F., and was extension lecturer at the University of Beaune. He is the author of *Philosophy of the World War*; *The Child—His Nature and Needs*; and *The Book of Rural Life*.

TILDEN, WILLIAM T., II (1893-). An American tennis player, born at Philadelphia, Pa. He won the national singles championship of the United States from William M. Johnston in 1920 and retained the title five years. He was a member of the American Davis Cup team (since 1920). He wrote *Art of Lawn Tennis* (1920); *Singles and Doubles* (1923), *Common Sense of Tennis* (1924), *Match Play* and *The Spin of the Ball* (1925), also *The Phantom Drive*, and other *Tennis Stories* (1924), and a play, *They All Want Something*, produced in 1926.

TILNEY, FREDERICK (1875-). An American neurologist, born in Brooklyn and educated at Yale University and the Long Island College Hospital. In 1903 he settled in New York City and was appointed visiting neurologist to Roosevelt and Bellevue hospitals. He became full professor of neurology at Columbia University in 1914. In addition to numerous contributions on neurological subjects to periodical literature, he wrote *A Study of the Hypophysis Cerebri* (1911); *Morphology and Evolutionary Significance of the Pituitary Body*, with L. F. Warren (1919); *Epidemic Encephalitis*, with H. S. Howe (1920); *The Form and Functions of the Central Nervous System*, with H. A. Riley (1920, 1923); *The Brain From Ape to Man* (2 vols., 1928).

TILSON, JOHN QUILLIN (1866-). An American lawyer and Congressman. He was born at Clear Branch, Tenn., and graduated from Yale (B.A., 1891; LL.B., 1893). He engaged in the

practice of law at New Haven, Conn., in 1898. In the Spanish-American War, he was a second lieutenant in the 6th U. S. Volunteer Infantry and in 1916 served as lieutenant colonel in the 2d Connecticut Infantry on the Mexican border. For two terms (1905-08), he represented New Haven in the Connecticut House as a Republican, being Speaker of that body in 1907. He was elected to the Sixty-first and Sixty-second Congresses as Representative-at-Large from Connecticut and represented the Third Congressional District in the Sixty-fourth to Seventy-first Congresses, inclusive. Since 1925 he has been majority leader of the House.

TIMBER. See FORESTRY.

TIMMERMAN, FELIX (1886-). A Belgian art critic, novelist, and dramatist. A member of the Academy of the Flemish Language, he was one of the leaders of the modern school. His works, which are in Flemish, include the novels *Pallietter*, *Anna-Marie*, *Het Kindeken Jesus in Blaanderen*; the play, *En waar de ster sleeft stille staan*; and a critical work, *Breughel*. With Edouard Verman, he wrote the plays *Mynheer Piroot* (1924), and *Leontientje* (1926).

TIN. Though the United States consumes considerably more tin than the rest of the world together, it must depend entirely on foreign sources of supply. In 1914 the world production of tin amounted to 116,569 long tons, of which more than one-half came from the Straits Settlements and the Malay Peninsula. The world output of tin decreased from 1917 to 1921, when but 113,462 long tons were produced. Since 1921, however, the tendency of production has been steadily upward. In 1927 world output totaled 156,208 long tons, while preliminary estimates for 1928 place the output at 175,000. Since early in 1927, prices have steadily declined, and it would appear that production was consistently in excess of consumption during the greater part of 1927 and 1928. A powerful financial group was formed in London, early in 1928, for the purpose of stabilizing the tin market. This organization is credited with having taken tremendous tonnages of tin from the open market in order to support a declining market. The ultimate result of this effort was still in doubt early in 1929.

The leading tin-producing countries are the Federated Malay States, Bolivia, Dutch East Indies, Nigeria, and Siam. Features of production trends in recent years include the rapid rise of Bolivia as an important producer. Since 1917 the tin-mining industry of Cornwall, England, has become virtually extinct, following many years of activity. An increasing proportion of the production from the Federated Malay States is from dredging operations which permit low-cost production and this factor has undoubtedly been of great importance in the lowering of price quotations that took place subsequent to 1926. Arrangements were made in 1927 between the Billiton Maatschappij and the chief British interests operating in the Tanganyika-Uganda tin field in central Africa for an extensive programme of prospecting work in this section. Production from this source had increased to 1200 long tons in 1927.

A feature of the tin market in 1928 was the establishment of a National Metal Exchange in New York, modeled after the London Metal Exchange, for the express purpose of trading in tin futures, and to provide "hedging" facilities for tin consumers and traders.

TINAYRE, tē'nār' (MARGUERITE SUZANNE) MARCELLE (née CHASTEAU) (1877-). A French novelist (see VOL. XXII), many of whose books were translated into English. Her later works include *La veillée des armes*. *Le départ*, 1914 (1915); *L'Ombre de l'amour* (1916); *Perséphone* (1920), *Les lampes voilées* (1920); *Le boucher d'Alexandre* (1922); *Priscille Séverac* (1922); *La vic amoureuse de Madame de Pompadour* (1924); *Figures dans la nuit*, short stories (1926); *Une provinciale en 1850* (1927); *Il y a cent ans* (1927); and *Terres étrangères* (1928).

TIRES. See MOTOR VEHICLES; RUBBER.

TIROL. See TYROL.

TITCHENER, EDWARD BRADFORD (1867-1927). An American psychologist (see VOL. XXII). On the twenty-fifth anniversary of his association with the Cornell University laboratory, he was honored with a volume of commemorative *Essays* (1917) written by his former pupils. In 1924 he published *Systematic Psychology*, which incorporated the experimental findings of the Cornell laboratory on perception, movement, and the integration of sensational attributes. Besides scientific papers, the only other work published by Titcheener after 1914 was *A Beginner's Psychology* (1915).

TITO, PITTORE ETTORE (1860-). An Italian painter, born at Castellana di Stabia. He studied at the Venice Art Academy, under Favetto, and in France, England, and Germany before becoming a professor in the Istituto Belle Arti at Venice. He became widely known for his pictures of Venetian subjects, winning gold medals at exhibitions in Monaco, Bavaria, Vienna, Rome, and Venice. His works are represented in museums in Rome, Venice, Trieste, Budapest, and other cities.

TITTONI, tēt-tō'nē, TOMMASO (1855-). An Italian statesman and diplomat (see VOL. XXII). At the outbreak of the World War, when he was Ambassador to France, he was in favor of Italian neutrality. After Italy's entry into the War, he resigned from the ambassadorship and became Minister of State in 1916. Premier Nitti gave him the post of Foreign Minister in 1919 and that of first delegate to the Peace Conference, but he was obliged to resign in November because of ill health. He was president of the Senate in 1920, and was appointed delegate to the Council and Assembly of the League of Nations, but his health did not permit him to act. In 1921 he became a member of the Royal Academy of Lincei. His later publications include *Who Was Responsible for the War?* (1918), *Conflitti politici e riforme Costituzionali* (1919), *Per la guerra e per la pace* (1919); *Modern Italy*, published by the Williamstown Institute of Politics (1922); *Discorsi e scritti* (1924), *International Economic and Political Problems of the Day and Some Aspects of Fascism*, edited by Baron di San Severino from Tittoni's writings and addresses (1926); and *Questioni del Giorno* (1928). He was a chairman of a committee which edited *La Nuova Antologia*, an independent monthly review.

TITULESCO, NICOLAS (1883-) A Rumanian diplomat and professor of law, who was born at Craiova, Rumania, and educated there in the College King Carol I and the Faculté de Droit, Paris. He was twice laureate of Paris University and in 1905 became professor of civil rights at the University of Jassy, transferring to the University of Bucharest in 1909. Elected to

Parliament in 1912, he became Minister of Finance in 1917, was a delegate to the Paris Peace Conference, and was one of the signers of the Treaty of Trianon. He was again Finance Minister during 1920-22, introducing the income tax and other sweeping changes in taxation. He then served as Ambassador to the Court of St. James (1922-26) and as Minister for Foreign Affairs (1927-29). In the latter year, he was re-appointed to the London Embassy. He wrote *La théorie des droits (ventuels)*; *La Distribution du Patrimoine*; *L'Impôt sur le Revenu*, *L'Impôt sur le Capital*, and other treatises on law and finance.

TOBIN, RICHARD MONTGOMERY (1866-). An American banker and diplomat, who was born at San Francisco, Calif., and studied at St. Ignatius College. He was engaged in banking at San Francisco after 1889, being at one time president of the Association of Savings Banks. In the World War, he served at Paris as representative of the U. S. Cable Censorship and in October, 1918, was assigned to additional duty as assistant to the naval attache at the American Embassy. Later, he was attached to the American Commission to Negotiate Peace. Since 1923 he has been Minister to the Netherlands.

TODD, ARTHUR JAMES (1878-). An American sociologist, born at Petaluma, Calif., and educated at the University of California and Yale University and in Paris and Munich. He was connected with settlement and probation work in San Francisco for several years and in 1911 became instructor in sociology at the University of Illinois. In 1914-15 he was professor and head of the department of the University of Pittsburgh, and from 1915 to 1921, professor of sociology and director of the training course for social and civic work at the University of Minnesota. In 1919-21 Professor Todd was also visiting professor of sociology at Northwestern University and in 1921 he accepted a permanent professorship there. He was associate editor of the *Journal of the American Institute of Criminal Law and Criminology* and wrote *The Primitive Family as an Educational Agency* (1913); *Theories of Social Progress* (1918), *The Scientific Spirit and Social Work* (1919); *Three Wise Men of the East* (1927).

TODD, HENRY DAVIS, JR. (1866-). An American army officer, born at Claveack, N. Y., and graduated at the United States Military Academy in 1890. He entered the artillery division of the Army and was promoted through the grades until he reached the rank of lieutenant colonel of artillery in 1913. He commanded the 33d Division from September 18 to Dec 7, 1917, the artillery supporting the 1st Division in the St. Mihiel offensive, and the 58th Field Artillery Brigade at the Meuse-Argonne Battle. He was with the 33d Division in Luxemburg as part of the Army of Occupation. In August, 1919, on the demobilization of the 33d Division, he entered the General Staff College in Washington. He was made brigadier general in the Regular Army in 1920 and was assigned to command the coast defenses of Manila Bay on June 3, 1921, and the Hawaiian Separate Coast Artillery Brigade in 1926. In 1927 he was promoted to Major general.

TOGOLAND, tō'gō-länd. Formerly a German protectorate on the coast of West Africa, between the Gold Coast and Dahomey but, since 1919 partitioned between Great Britain and France as mandate territories. It has an area of 33,700 square miles, of which 21,893 square miles are

in the French and the remainder in the British mandated territories, and a population in 1929 estimated at 747,000 natives and 448 Europeans. Lome is the chief port. Products for export are palm kernels and oil, rubber, ivory, and copra, though cotton, coffee, tobacco, and cacao were becoming important. Exports for 1913 were 9,138,000 marks (£456,000) and imports 10,631,000 marks (£531,000). In 1927 imports for French Togoland amounted to 100,715,688 francs and exports to 82,242,713 francs. For 1913-14 the budget balanced at 4,057,136 marks and the colony was self-supporting. The local budget for French Togoland balanced at 33,478,000 francs in 1927. There was also a railway budget of 10,200,000 francs and a public health budget of 6,200,000 francs. The British section was administered from the Gold Coast. Railways totaled 204 miles. In 1913 a cable line linked Germany with Togoland, and a wireless station at Kamina was in direct communication with Berlin. German local officials attempted to keep the territory neutral during the World War, but the offer was refused and local British and French troops invaded the country. Opposition was slight with the result that the colony was completely occupied in August, 1914. Mandates were granted Great Britain and France by the Supreme Council in May, 1919; in July, 1919, the country was partitioned by both interested parties provisionally, and in September, 1920, permanently. France received the port of Lome and the entire seacoast of 32 miles.

TOLEDO. The third city of Ohio. The population increased from 168,497 in 1910 to 243,164 in 1920 and to 313,200 in 1928, by estimate of the U. S. Bureau of the Census. Toledo's 812 manufacturing concerns are so diversified that the city's great industrial development since 1914 can be attributed to no special group. Toledo is, however, the centre of the metal-wheel industry and ranks first in the production of gloves, mittens, and spark plugs, and third in the production of automobiles and canvas goods. In 1927, according to the U. S. Census of Manufactures, 38,727 persons were employed by 562 industrial establishments and received \$57,049,356 in wages; the value of products manufactured was \$360,114,996. In 1928, 38 new industries located in Toledo, representing an initial investment of \$7,040,000, and 82 existing concerns enlarged their plants at a cost of \$11,050,000.

The port of Toledo is the largest coal-shipping port in the United States, its cargo having increased from 7,095,593 tons in 1922 to 126,348,605 tons in 1927. The total foreign commerce of the port in 1927 amounted to 2,047,585 tons. In 1929 construction was begun on a new terminal for the Hocking Valley Railroad at Presque Isle, where the Maumee River joins Maumee Bay. More than \$6,000,000 was authorized for the construction of four slips for freighters, a concrete dock 14,000 feet long and 200 feet wide, coal-loading and ore-unloading machinery, a grain elevator, a warehouse, and many miles of railroad track.

In 1924 the Summit Street extension, to link the South Side and the business section by a direct route, was completed, and the sewer system was increased by 41 miles to provide intercepting sewers and a pumping station. In 1927 a \$1,034,000 street-paving programme was inaugurated, and the following year a transcontinental airport was established on a 516-acre tract 7 miles south of the business section.

Building construction has been active since 1924. Among the important buildings erected are the Stephens and the Commodore Perry hotels, Toledo-Paramount Theatre, Toledo Blade Building, Security, Savings Bank & Trust Co. Building, Toledo Hospital, and Masonic Temple. In 1925 the first unit of Toledo's Civic Centre, the new Safety Building, was erected at a cost of approximately \$1,000,000. In 1928 the city completed the erection of the Erie Street Market Building for use as an exhibition hall during the winter months and as a produce market in the summer. Through a bequest of \$3,000,000 from Edward Drummond Libbey, the Toledo Art Museum was enlarged and a school of music and a school of design erected.

At the election in November, 1928, bond issues amounting to \$11,800,000 were approved. Of this total, \$5,000,000 was for new schools, \$3,000,000 for a new high-level suspension bridge over the Maumee River, \$2,850,000 for a new and enlarged municipal university, and \$950,000 for a new county infirmary. In June, 1929, the United States Supreme Court reversed the judgment of the United States Circuit Court of Appeals and handed down a decision permitting the elimination of the Miami & Erie Canal between Toledo and Grand Rapids, thus ending some 10 years of litigation. This decision has made it possible for the city to develop over the canal's right-of-way a boulevard leading directly to the business section, to construct a new union station for the 24 railroads that centre in Toledo, and to develop a new large residential section at Maumee. The public-school system has expanded greatly since 1914, more than \$6,500,000 being spent on the construction of new buildings. The school enrollment in 1928 was 61,500. Bank clearings in 1928 amounted to \$1,103,780,000. The assessed valuation of property in the city in 1927 was \$584,523,000; the net debt was \$32,966,000.

TOLEDO, UNIVERSITY OF THE CITY OF. A municipal institution at Toledo, Ohio, founded in 1872. The student enrollment increased from 1147 in 1918 to 2034 in 1928, the faculty from 30 to 84 members, and the library from 4558 to 21,000 volumes. The annual income rose from \$145,000 to \$250,470. A new science building was completed in 1921 and a department of elementary teachers' training was established in 1922. In 1928 the city voted a bond issue of \$2,850,000, of which \$2,000,000 is for buildings, \$350,000 for site and \$500,000 for equipment, all to be available in the fall of 1930. President, Henry John Doermann.

TOLL BRIDGES. See BRIDGES.

TOLLER, ERNST (1893-). A German dramatist, born at Samtschin. He attended college at Bromberg, studied at the universities of Heidelberg, Munich, and Grenoble, and entered politics in 1918. He was second chairman of the council of workmen, soldiers, and peasants during the revolution in Munich (1919) and for his participation was condemned to five years' imprisonment in the fortress of Niederschönfeld. There he wrote the plays which have profoundly stirred audiences in Germany: *Wandlung* (1919); *Alasse Mensch* (1921); *Die Ludditen* (1921); and *Der Deutsche Hinkemann* (1922). His later plays *Der entfesselte Wotan* (1923), and *Hopla, wir leben* (1927) have not had the same success. He also has written some verse, *Das Schwalbenbuch* (1923), and the autobiographical volume, *Justiz*.

TOLMAN, RICHARD CHACE (1881-). An American chemist, born at West Newton, Mass., and educated at the Massachusetts Institute of Technology, where he was a Dalton fellow. He also studied at Berlin and Crefeld. He taught at the Massachusetts Institute of Technology, Cincinnati University, the University of California, and the University of Illinois. During the World War, he was made chief of the dispersoid section of the Chemical Warfare Service with the rank of major and in 1919 was made associate director of the fixed nitrogen research laboratory of the Ordnance Bureau of the United States Army, of which he became director in 1920. Since 1922 he has been professor of physical chemistry and mathematical physics at the California Institute of Technology. He is a member of the National Academy of Sciences. His early investigations had to do with colloids, ionization, and similar subjects in physical chemistry. He later investigated the behavior of smokes and reactions of nitrogen compounds. In addition to various minor publications, he is the author of *Investigations on the Relativity of Motion* (1917) and *Statistical Mechanics with Application to Physics and Chemistry* (1927).

TOMLINSON, H. M. (1873-). A British journalist, essayist, and travel writer. He became a member of the editorial staff of the *Morning Leader* in 1904, was a war correspondent in Belgium and France (1914-15), and official correspondent at the G. H. Q. of the British Armies in France (1915-17), and literary editor of the *Nation* and the *Athenæum* (1917-23). He traveled a great deal, and his first book, *The Sea and the Jungle* (1912), was an account of his trip up the Amazon. As he developed, his prose became almost rhythmic and his descriptive powers were particularly successful in evoking atmosphere. He wrote *Old Junk*, essays (1919); *London River*, reminiscences of its ships (1921); *Waiting for Daylight*, essays (1922); *Tidemarks*, about his visit to Malaya (1924); *Under the Red Ensign* (1926); *Gifts of Fortune* (1926); *Gallion's Reach*, his first novel (1927); *Essay on Hardy* (1928); and *Illusion: 1915* (1928).

TOMMASINI, VICENZO (1880-). An Italian composer, born in Rome. He studied there under Pinelli (violin) and Falcini (composition) and later under Max Bruch in Berlin. He is one of the few living impressionists who have not yet crossed the border line into futurism. He wrote the operas, *Medea* (Trieste, 1906), *Amore di Terra Lontana* (not produced), and *Uguale Fortuna* (Rome, 1913); a ballet on themes of Scarlatti, *Le Donne di Buon Umore* (Rome, 1917); the symphonic poems, *Poema Erotico*, *Il Beato Regno*, and *Paesaggi Toscani*; a prelude to *L'Hymne à la Beauté*; a suite and *Chiara di Luna*, for orchestra; two string quartets and a violin sonata; choruses a capella; songs; and piano pieces.

TOMSKY, MIKHAIL PAVLOVICH (1880-). A Russian Communist leader and public official. He joined the revolutionary movement in Russia in 1905, was arrested and banished to Siberia in 1906, and after repeated escapes, arrests, and banishments, was freed from Siberia in April, 1917. Under the Soviet régime, he served first as editor of *The Metallist and Trade Union Messenger*, later becoming chairman of the Trade Union Congress, a member of the Presidium of the Central Executive Committees of the United Soviet Socialist Republics and the Communist

Party, and a member of the Political Bureau. As one of the most powerful members of the Soviet leaders, he came into conflict with Stalin in 1928 over the latter's five-year plan for the industrialization of Russia and was removed from his position as chairman of the Trade Union Congress in June, 1929.

TÖNDER. See SCHLESWIG.

TONGO, OR FRIENDLY ISLANDS. See PACIFIC OCEAN ISLANDS.

TÖNISSON, JAAN (1868-). A President and Prime Minister of Estonia. He was educated at Tartu University and previous to the World War was a member of the first Russian Duma. A leader in the Estonian agitation for independence, he was president of a delegation which sought to enlist the sympathies of Western European nations on behalf of his country during 1917-18. In 1919-20 he was a member of the Constitutional Assembly and since the latter year has been a member of the Diet, of which he was president in 1923-25. In 1928 he was President and Prime Minister of the Republic. He was owner and editor of *Postimees*, the oldest journal in the country.

TONKING. See FRENCH INDO-CHINA.

TORNADOES. See METEOROLOGY.

TORONTO. The capital of the Province of Ontario and in size, the second city of Canada. The population in 1928 was estimated to be 569,899. The area is 35 square miles. The government of the city is vested in a municipal council, consisting of the mayor and four members forming the Board of Control (all five being elected annually by the citizens at large) and 24 alderman (three being elected annually from each of the eight wards into which the city is divided). The council as a whole is the legislative body of the municipality and carries on its work through standing committees. The Board of Control is the executive body and is responsible for the preparation of the annual estimates and the supervision of matters relating to finance, the appointment of officials, the carrying on of public works authorized by the council, and the general administration of the affairs of the city. The department of education is under the control of a board of education elected by the citizens, and the department of police is under a board of police commissioners consisting of the mayor and two judges of the county court.

The Toronto Harbor Commission, which was authorized by the Act of 1911, consists of five commissioners, three of whom are appointed by the City Council and two by the Dominion Government. The improvements which the commission inaugurated in 1913 at an estimated cost of \$19,000,000 consist of the reclamation of Ashbridge's Bay, a marsh tract of 1000 acres renamed the Eastern Harbor Terminals; the construction of a ship channel, turning basin, and circulating channel, marginal way wall, and retaining walls on each side of Keating's Channel; the construction of a new harbor head line from York to Yonge streets and the reclamation of the area enclosed by it, the deepening of the whole harbor to a navigable depth of 24 feet with provision for an ultimate depth of 30 feet, and the construction of outside breakwaters and the reclamation of 900 acres of land for park and recreational purposes at the east and west ends of the city and on Toronto Island. By 1929, 1094 acres had been reclaimed; the Boulevard Drive, 50 feet wide, had been completed a distance of approximately four miles; and the Traffic Highway

on which the Toronto Transportation Company was operating cars had taken the place of the old Lake Shore Road. Sunnyside Beach, a recreation centre, was opened in June, 1922.

The Canadian National Exhibition, which has been held annually in Toronto since 1878, enlarged its scope during the past few years through the erection of various new buildings. Among these were the Pure Food, the International, the Province of Ontario, the Engineering and Electrical buildings, the Coliseum, and a \$1,400,000 live-stock exchange. One of the major features of the 1927 exhibition was the new eastern entrance which was opened by the Prince of Wales and Prince George and was named the Princes' Gates. A record attendance of 2,000,000 persons was reached in 1928. In 1926 an eight-story warehouse with 1,000,000 square feet of floor space was erected in the harbor district at a cost of \$6,000,000, and in 1929 the Canadian Bank of Commerce erected a 30-story structure, the tallest in Toronto, at a cost of approximately \$5,000,000. The latter building was expected to be the first step in a centralization of financial houses within a definite downtown area.

In 1928 Toronto had 106 public schools with an attendance of 92,707 and 17 separate schools with an attendance of 12,435. The value of all public school properties was \$27,213,394 and of separate school properties, \$3,167,267. Imports into the harbor of Toronto in 1927 were valued at \$242,213,317 and exports at \$1,522,000. In 1926, 86,439 persons were employed in 2013 industrial establishments and received \$107,734,568 in wages, the value of products manufactured was \$489,522,114. In 1928, 9208 building permits were issued representing a value of \$51,607,188. The assessed valuation of property in 1928 was \$907,371,437; the net debt was \$147,476,966.

TORONTO, UNIVERSITY OF. An institution of higher learning founded in 1827 at Toronto, Ontario, Canada, consisting of seven faculties with four arts colleges, supported by the provincial government. The student enrollment in 1914 was 4000, compared with 5961 in the autumn of 1928. The faculty was increased during the same period from 453 to 659 members and the library from 138,658 bound volumes and 46,648 pamphlets to 220,349 bound volumes and 76,876 pamphlets. Total expenditures in 1927-28 for salaries and maintenance was \$2,396,212. The Rockefeller Foundation after 1921 made numerous gifts for the development of the faculty of medicine and in 1928 from this source was received a grant of \$250,000 for the school of hygiene. Trinity College and a forestry building were opened in 1925. A faculty of dentistry was established in the same year by taking over the school of dentistry of the Royal College of Dental Surgeons. A hygiene and public health building was completed in 1927, as were an addition to the Press building and a hockey and skating arena. President, Sir Robert A. Falconer, K.C.M.G., M.A. LL.D., D.C.L., D.D., Litt D.

TORTS. See LAW, PROGRESS OF THE.

TOSCANINI, tōs'ka-nē'nē, ARTURO (1867-). An Italian conductor (see VOL. XXII). During the World War, he gave his services freely, conducting innumerable concerts throughout Italy for the benefit of various war activities. In 1918 he gave in Milan a series of 12 symphony concerts, the entire proceeds of which he distributed among Italian musicians who had

been reduced to want by the War. In this connection, an incident should not go unrecorded that showed his uncompromising attitude and the moral strength of his artistic convictions. When at one of the earlier concerts hisses were heard at the beginning of an excerpt from Wagner, he immediately stopped the orchestra, faced the audience and, without uttering a word, compelled instant silence. After La Scala, in Milan, had been rebuilt and enlarged, he was made sole artistic director in 1921. Even during his first connection with La Scala as principal conductor (1898-1908), the performances there were on a higher level than those of any other opera house in Italy; but now, as absolute dictator, dominating the entire personnel from the proudest soloist to the humblest stage-mechanic and giving his personal attention to the minutest details, he secured a perfection of ensemble that made La Scala the première operatic institution of the world. Among the recent world-premières given there, two stand forth as musical events of international importance, the production of Boito's *Nerone* (May 1, 1924) and Puccini's *Turandot* (Apr. 25, 1926). During the spring of 1929, he took the entire La Scala company on a tour to Vienna and Berlin, arousing unbounded enthusiasm in both cities. He announced unexpectedly after the final Berlin performance (*Aida*, May 29) that on that occasion he had made his farewell appearance as an operatic conductor, as he had severed his connection with La Scala in order to devote his entire time to concerts. At the same time, however, he accepted the invitation of Siegfried Wagner to conduct the performances of *Tristan and Isolde* at Bayreuth during the festival of 1930. It was the first time that this honor was conferred upon a foreign conductor.

Supreme as Toscanini stands as an operatic conductor, he is equally great as a symphonic conductor. In fact, all his life he has been active in both fields. His first appearance in concert in the United States occurred during his engagement at the Metropolitan Opera House on Apr. 13, 1913, when he produced Beethoven's *Ninth Symphony*. In 1921 he made a concert tour of this country with his entire La Scala Orchestra. Then he came for four consecutive seasons as guest-conductor of the New York Philharmonic Society (1926-29). For the season 1929-30, he was engaged as one of the three permanent conductors, the others being Mengelberg and Molinari. Consult *Arturo Toscanini*, by T. Nicotra (translated by I. Brandeis and H. Kahn, New York, 1929).

TOTEMISM. See ANTHROPOLOGY; ETHNOLOGY.

TOUT, THOMAS FREDERICK (1855-1929). A British historian (see VOL. XXII). Until 1925 he was professor of history at Manchester. In 1923 he was president of the International Historical Congress at Brussels and in 1925, president of the Royal Historical Society. He lectured at Cornell University in 1927-28. He is the author of *Administrative History of Medieval England* (1920, 1928, 1929) and *France and England: Their Relations in the Middle Age and Now* (1922).

TOVEY, DONALD FRANCIS (1875-). An English composer, born at Eton. He was a private pupil of S. Weisse (piano), Sir W. Parratt (counterpoint), and J. Higgs (composition). From 1906 to 1912, he gave several of his own works at chamber-music concerts (the

Chelsea Concerts) in London. In 1914 he was appointed Reid professor of music at the University of Edinburgh, where, in 1917, he established the Reid Symphony Concerts. In 1925-28 he made a very successful tour of the United States as pianist. As a composer, he shows decided preference for chamber music, in which field he produced a piano quintet, a piano quartet, a 'cello sonata, clarinet sonata, two string quartets, and three trios. He also wrote a symphony; a suite for string orchestra; a piano concerto; incidental music to Maeterlinck's *Aglavaine et Selysette*; church music; and piano pieces. An opera, *The Bride of Dionysus*, although published, has not yet been produced (1929).

TOWNER, HORACE MANN (1855-). A Governor of Porto Rico, born at Belvidere, Ill., and educated at the University of Chicago. He was admitted to the bar in 1877 and after practicing law for some years became judge in the third judicial district of Iowa. From 1911 to 1923, he served continuously in Congress, and although he was elected for another term in 1923, he resigned to accept the post of Governor of Porto Rico, for which his service as chairman of the Congressional Committee on Insular Affairs had especially prepared him. He resigned in 1929.

TOWN PLANNING. See CITY PLANNING.

TOWNSHEND, TOWNSEND, SIR CHARLES (VERE FERRERS) (1861-1921). A British soldier (see Vol. XXII). He was promoted to the rank of major general in 1911 and during the World War commanded the 6th Division in Mesopotamia, which withstood the Turkish siege of Kut-el-Amara for nearly five months (1916). He became a Turkish prisoner, although later freed, and was knighted in that year. In 1920, after 40 years of service, he resigned from the army and entered Parliament as an Independent. He wrote the *Life of Field Marshal First Marquis Townshend* and *My Mesopotamia Campaign* (1920).

TOYNBEE, ARNOLD JOSEPH (1889-). A British historian who was educated at Winchester and Balliol College, Oxford, where he was a tutor (1912-15). During the World War, he was in the Political Intelligence Department of the Foreign Office. He was a member of the British delegation to the Peace Conference (1919), Keble professor of Byzantine and modern Greek languages, literature, and history at the University of London (1919-24), and in 1925 he became director of studies in the Royal Institute of International Affairs, and professor of international history in the University of London. In 1925 the first volume (1920-23) of his yearly *Survey of International Affairs* appeared. His writings include *Nationality and the War* (1915), *Chapters on Greece in the Balkans: A History* (1916); *The Western Question in Greece and Turkey* (1922), *Greek Historical Thought* (1924); *The World after the Peace Conference* (1925); and *Turkey* (with K. P. Kirkwood) (1926).

TOYNBEE, PAGET (1855-). An English scholar (see Vol. XXII), especially known for his studies of Dante. He was honored by many degrees, and membership in the British and other European academies. His later works include *Supplement to Mrs. Toynbee's Edition of the Letters of Horace Walpole* (3 vols., 1919-1926); *The Letters of Dante*, amended text and translation (1920); *Britain's Tribute to Dante in Literature and Art* (1921); *Dante Studies*

(1921); *Horace Walpole's Journal of the Printing Office at Strawberry Hill* (1923); *Horace Walpole's Reminiscences* (1924); *Strawberry Hill Accounts* (1927); *Horace Walpole's Journal of Visits to Country Seats* (1928).

TRACKLESS TROLLEYS. See MOTOR VEHICLES.

TRACTOR, FARM. The tractor is a mechanically propelled prime mover having as its source of self-contained power usually an internal-combustion engine and, in a few special types, a steam engine. The significance of the tractor in agriculture is its utility as a source of tractive energy for field and hauling operations and as a source of belt power for stationary mechanical farm operations. The earlier tractors were large, heavy, and powerful machines actuated by steam engines. They were used almost exclusively for heavy hauling, heavy drawbar work such as the pulling of very large gang plows in the breaking of virgin prairie lands on a large scale, and for heavy farm belt work, such as the operation of threshers and corn shellers, usually on custom work. Steam tractors are still used in agriculture occasionally for operations requiring higher and steadier power. They are used to a certain extent in Europe, for example, for the operation of cable-drawn and cultivating outfits adapted to swampy or other soil conditions which will not permit the operation of a heavy tractor in direct traction.

The internal-combustion-engine tractor is a more recent development and has now largely supplanted the steam tractor for use in agriculture. Kerosene also has largely supplanted gasoline as a fuel, thus materially reducing the cost of operation. Some types are started on gasoline and are switched to kerosene when warm, while other types operate wholly on kerosene. There are a number of types and sizes of internal-combustion-engine tractors, the total number of makes being approximately 50 in 1928 with each manufacturer producing from 1 to 3 models. In a broad general way, this variation corresponds to distinct types of agricultural service. For example, the small garden tractor weighing about 500 pounds, rated at 1.25-4 horse power, is adapted only to certain light garden operations and belt operations requiring a low maximum power. On the other hand, the extremely large tractor weighing in the neighborhood of 30,000 pounds rated at 70-120 horse power, is adapted only to the heaviest of drawbar and belt operations. A great variety of types and sizes of tractors exists between these two extremes. It would seem, therefore, that the variation is due much more to lack of standardization than to the variation in the requirements of agricultural processes.

As a rule, the general characteristics of a tractor for agricultural use are governed largely by the number and size of plows it can pull through average soil at an average depth and speed. While tractors are designed and built to run at speeds varying up to 15 miles or more per hour on actual drawbar work, a plowing speed of about 2½ miles per hour for tractors of 15 drawbar horse power or less is generally considered to be the most efficient speed under average conditions. Small plats usually require only a small garden tractor of 1.25-4 horse power which will pull a 12-inch plow. Truck farming will require a tractor capable of pulling one 14-inch plow. Farms up to 160 acres in size require a tractor capable of pulling at least two

plows, while farms of 300 acres or more will require a tractor capable of pulling three or more plows. As a very general average, and depending upon the soil, about eight drawbar horse power is required to pull two 12-inch plows, 10 horse power for two 14-inch plows, 15 to 20 horse power for three to five 14-inch plows, 22 to 30 horse power for five or six 14-inch plows, and 30 to 45 horse power for from six to twelve 14-inch plows.

The propulsion requirements in drawbar work govern the characteristics of the driving mechanism and ground-gripping devices of tractors. Tractors divide, broadly, into wheel and crawler or self-tracklaying types. In the wheel-type tractor, propulsion results from the action of two large drive wheels equipped with ground-gripping lugs and actuated by means of the engine through the medium of gears, clutches, and shafts. In order to secure the greatest traction, it has been found necessary to use certain shapes, sizes, and arrangements of lugs for individual soils or soil conditions. The manner in which the lug presents or transmits the tractive impulse to the soil appears to be a vital factor in the efficiency of the tractor. Apparently the greatest factor in the transmission of tractive force from any lug depends upon the tractor drive wheel taking the fullest advantage of the arching action of the soil, so that with a given width of drive-wheel rim the traction increases to a maximum as the weight carried by the wheel increases up to a certain limiting point.

The highest efficiency is produced with a weight on the wheel just sufficient to force the lug into the soil, and the traction increases with the width of wheel rim under these circumstances. For example, solid angle-iron lugs are best in loose soils having slight arch action, but spade lugs are superior to angle lugs in loose sand with a heavy weight on the wheels. Sharp spade lugs also are better in soil having an appreciable arch action under the wheel rim. The majority of wheel tractors are steered with ordinary steering gear attached to two wheels independent of the drive wheels, although in some special types steering is done with the drive wheels. The majority of tractors are of the wheel type on most farms of average size.

Considerable experience and care are necessary in the operation of wheel tractors, especially when drawing cultivating machinery, since the sudden and severe resistances occurring in cultivation emphasize the rotating tendency of the tractor around its drive-wheel axles and frequently result in accidents and damage. Special types of hitches and release springs have been developed to prevent accidents and breakage of implements and tractor by releasing the tractor or cushioning the shock when obstructions are encountered. Tractor construction also has become better balanced, to conform to the severe requirements of drawing tillage machinery, and the alignment of hitches improved so as to reduce to a minimum the tendency for accidents and breakage to occur.

The crawler or tracklaying tractor is adapted especially for conditions where drawbar work is very heavy or where soil and topographic conditions will not permit the operation of a wheel tractor. Such a tractor consists of an engine and frame mounted on and propelled by a combination of large-gear wheels and very broad, heavy endless chains. These chains are wide and large enough so that the weight of the tractor is distributed over quite a broad area,

resulting in a very low unit pressure on the soil, thus permitting operation with ease over soil in which a wheel tractor would sink, or over ditches or rough topography, and with a maximum propulsive efficiency. The crawler tractor is thus a very powerful unit and has been found well adapted to the breaking of virgin swamp and cut-over lands in the United States, to rice-land cultivation, especially in India, and to certain large-scale truck-growing operations in the Southwest where the tillage operations are severe and the tractor is subjected to very heavy loads. For the greater part, therefore, the crawler tractor is a heavy, high-powered unit of relatively high price, as compared with wheel types, although the tendency to develop lighter crawler models is naturally reducing their price.

About the hardest agricultural belt work for which a tractor is adapted is operating the threshing machine. Such work will require from 10 to 80 horse power, varying with the type of machine and grain, but under most conditions the threshing of wheat and oats will require only from 20 to 30 belt horse power. Others of the larger belt-power applications of the tractor are corn husking and shedding, hay baling, ensilage cutting and blowing, corn shelling, and feed grinding, all of which usually require less power than threshing. While there is considerable controversy as to the extent of the actual utility of the tractor in agriculture, obviously, it has become a factor of considerable importance in farming operations. Its capability of performing timely field operations quickly and on a large scale was officially recognized by the French, British, and Italian governments in their efforts to increase food production during the War. It was extensively used in the United States for belt and drawbar operations on farms even prior to 1917.

As evidence of the continued and increased belief in its utility on farms, especially under conditions where timeliness in the performance of belt and field operations is an important factor, a conservative estimate indicates that there were approximately 325,000 internal-combustion tractors on farms in the United States on Jan. 1, 1923, and approximately 400,000 on Jan. 1, 1924, representing an actual increase of 100,000 and a discard of 25,000 in one year. Since that time, it may be conservatively estimated that there has been an average annual increase in the number of tractors on American farms of between 75,000 and 100,000, and on Jan. 1, 1928, there was a total number of approximately 769,000. According to data collected by the U. S. Department of Commerce at its annual canvass of manufacturers of farm equipment, the total production of tractors in 1928 amounted to 171,137, valued at \$161,461,462. Of this total, 152,124, valued at \$113,730,502, were of the wheeled type, and 19,013, valued at \$47,730,960, were of the tracklaying type. Of the tractors sold by manufacturers, 99,491, valued at \$98,528,923, were for use in the United States, and 48,806, valued at \$42,220,807, were sold for export.

The conditions and requirements of service for different localities and types of farming are so variable as to make it difficult to estimate the average life of a tractor with any accuracy. In some localities, for example, tractor depreciation is high on account of excessive wear of bearings and internal friction-parts of engines due to abrasive dust. This is being overcome to a large extent by the use of boxed bearings, air cleaners

on the air intake of the tractor-engine carburetor, and better lubrication. An estimate of from five to seven years of useful life for a tractor in agricultural use would probably be sufficiently conservative for the majority of conditions of normal service.

TRADE-COMMISSION ACT. See TRUSTS.

TRADE-UNIONISM. The history of trade-unionism in the period following 1914 may roughly be divided into three periods, the stagnation during the World War, the tremendous expansion in the years after the Armistice, and the relative decline in the succeeding few years due to the industrial depression resulting from the War and the peace treaties. For some years before the War, trade-unionism had been steadily growing in most countries. The War brought this growth to a sudden halt. The International Federation of Trade Unions and the Trade Internationals ceased to exist and international relations among trade unionists were in abeyance. The effect of the War on trade-unionism was, however, by no means uniform in the various countries. While in some countries, as in Germany, trade unions lost in membership and influence, other countries, like Great Britain and the United States, saw a steadily growing development of organized labor. The post-war period witnessed an immediate rebirth of international trade-unionism as well as an unprecedented increase in the membership of the labor organizations of practically all countries, although, where such increase had been due to war prosperity, the membership fell off again once the after-effects of the War made themselves felt. As for mode of organization, the trade or craft union still remained the standard. With the appearance of new industrial problems, however, and with the increasing hold which the idea of industrial democracy had obtained in one form or another on the imagination of the worker, industrial unionism had made rapid progress, although it was still more a potentiality and an aim than an actual system of organization. The industrial world which confronted the trade-unionist of 1929 was more complex than it was in 1914. New industrial problems had come to the fore and with them new attempts at solution. The

various forms of industrial democracy which had been advanced and in some cases applied, were entirely a product of the period, and they had taken different shape in the various countries. Another important development was the spread of syndicalism, not only in strictly syndicalist labor organizations, but also within the rank and file of orthodox craft unions. See HOURS OF LABOR; LABOR ARBITRATION; LABOR BANKS; LABOR LEGISLATION; INDUSTRIAL DEMOCRACY; SYNDICALISM.

International Trade-union Organizations.

The most important trade-union international before the War was the International Federation of Trade Unions with headquarters at Amsterdam. In 1912 it had a membership of 7,394,461, representing 19 countries. It was a rather loose organization and went to pieces immediately at the outbreak of the World War. During the War, the Inter-Allied Trade Union Conference was held at Leeds in 1916 and the Central Powers and Neutral Conference was held at Beine in 1917. Although both conferences and the three labor bureaus at Amsterdam, Paris, and Berlin made attempts to revive some sort of international labor activity, the International Federation of Trade Unions was as dead as the Socialist International. After the War, at the conference at Amsterdam in July, 1919, the old International was reconstructed. It was an alliance of national trade-union federations and trade internationals or, as they are commonly termed, international trade-union "secretariats." Its objects were the promotion of the interests of the organizations affiliated with it and of the trade-union movement in countries not affiliated with it, the promotion of combined action on all questions of trade-union interests, the prevention of international blacklisting, and the provision of funds for these purposes. In July, 1920, the International declared a boycott of the White government in Hungary, which 20 days later had to be abandoned as unsuccessful. The American Federation of Labor had been one of the constituent organizations which formed the International in 1920. Because of the close alliance between the International Federation of Trade Unions and the Socialist International, Samuel Gompers denounced the former as Socialist and the A. F. of L. withdrew in the autumn of 1921. To 1929, the A. F. of L. had not rejoined the International. The total membership of the new International at the time of its formation was 23,170,000. Due to the heavy losses in the membership of the British, Italian, French, and other affiliated organizations and to the withdrawal of the A. F. of L., the membership sank to 18,923,931 at the end of 1922. For the Syndicalist International, see SYNDICALISM.

At its 1924 meeting at Vienna, the International had in the neighborhood of 19,000,000 members in 19 countries. During 1924-29 the organization gave much attention to the recognition of Soviet Russia, and because of the refusal to cooperate with the Red International, the group was practically divided in two. At the 1927 meeting, the delegates represented but 13,445,553 trade-unionists all of whom came from European countries with the exception of the representation from Palestine, Canada, Argentina, and South Africa. A. A. Purcell, British trade-unionist, failed of reelection to the presidency because of his Communist sympathies.

The International, by 1927, had become as conservative as the A. F. of L., and its policies

were not unlike the American organization. It favored the 8-hour day, universal peace, abolition of child labor, etc. The conventions had become triennial and the organization had moved its headquarters from Amsterdam. Other international bodies were the International Federation of Working Women, the International Federation of Christian Trade Unions, and the Red International, which last was completely under Moscow control. See COMMUNISM; SOCIALISM; LABOR, AMERICAN FEDERATION OF.

United States. American trade-unionism is confronted with specifically American conditions and difficulties which preclude a development along European lines and give the American labor movement a distinct character. In spite of these obstacles, however, American organized labor advanced very far during the 15 years under discussion. From 1914 onward, American public opinion changed its attitude toward organized labor, coming to accept it as a legitimate expression of American democratic ideals. The active support which organized labor gave to the Government in the prosecution of the War increased its prestige greatly. It benefited materially from the war prosperity, as well as from the relative absence of the competition of immigrant labor during the War. With the close of the War, however, unemployment arrived and gave labor a decided setback, from which it has not fully recovered. An offensive for the "open shop," which reached its most intensified form in the great steel strike of 1919, was carried on by the employers' organizations and did serious harm to American trade-unionism. Another blow to labor was the settlement of the Coronado case in 1922. The verdict pronounced the liability of trade-union funds for damages in case responsibility had been established. The new movement for industrial democracy found its chief expression in the United States in the Plumb Plan, a scheme sponsored by the railway unions for tripartite control of the railroads by the State, the owners, and the workers. Perhaps the outstanding event, however, in the American labor movement during the period was the successful organization of the sweated workers in the needle trades into such powerful bodies as the Amalgamated Clothing Workers of America and the International Ladies' Garment Workers' Union and the formation of other groups such as the Amalgamated Textile Workers, the Amalgamated Food Workers, and the American Federation of Teachers.

American Federation of Labor. This organization, comprising most of the trade-unionists in the United States and many of those in Canada, counted a great increase in its membership, 1914-28, although the later years of industrial depression cut in on this advance. From 2,020,671 in 1914, the membership rose steadily to 4,078,740 in October, 1920, after which it showed a falling off. At its Portland Convention in October, 1923, the A. F. of L. reported a membership of 2,926,468. The organization was strictly a federation of craft unions, in spite of the fact that its largest affiliated body, the United Mine Workers of America, with a membership of 400,000, was an industrial union and that there existed within its ranks an active minority in favor of industrial unionism, which, in 1918, led the A. F. of L. into its unsuccessful policy toward unionization of the steel workers and brought about the great steel strike of 1919 with its decisive victory for the "open

shop." The A. F. of L., being conservative in policy, did not appeal to the unskilled worker. This conservative tendency manifested itself, aside from the withdrawal from the Amsterdam International, in its consistent opposition to the formation of an American Labor Party and in its friendly relationship with the American Legion. The authority of the official element led by President Gompers and the rigid central control had so far been able to keep down the radical elements, although a steadily growing opposition with new tendencies had appeared. This became apparent in the Montreal Convention in 1920 when a resolution for government ownership of railroads and inland waterways with democratic control was adopted in spite of Gompers' opposition.

The following has been the membership of the A. F. of L. since 1923: 1924, 2,880,000, 1925, 2,878,297; 1926, 2,813,910; 1927, 2,812,407, 1928, 2,896,063. The most significant event in the history of the A. F. of L. in the post-war period was the death of Samuel Gompers on Dec 13, 1924. He had been the movement's leader, with but one year's interruption, since its founding in 1881. He it was who gave the A. F. of L. its conservative stamp; he opposed affiliation with the Amsterdam International, refused to follow the leader of British trade-unionists in favoring a political party, was on friendly terms with capital and believed that the best interests of labor could be furthered by slow and peaceable advances.

Around this doctrine, A. F. of L. programmes have crystallized. The Federation has devoted itself to advocacy of better pay and shorter hours; of unionization of mechanized industries such as the automobile industry, of condemnation of company unions; and of a clarification of the legal status of unionism, particularly in the equity courts. This has reference to the widespread use of the injunction-power of courts during strikes.

The A. F. of L. has formally gone on record as opposed to the official recognition of Russia and even went so far as to advise withdrawal of support of Brookwood Labor College (in 1928) because that school was giving courses explaining Communist doctrine. The A. F. of L. consistently fought against child labor, but it made no real efforts to unionize women, Negroes, and "white-collar" workers. Its president, following the death of Samuel Gompers, has been William Green, though its leading spirit appears to have been Matthew Woll, the Federation's vice president. See LABOR, AMERICAN FEDERATION OF.

Great Britain. British trade-unionism made important numerical gains after 1914. Its membership rose from 3,918,809 in that year to 8,023,761 in 1919. In the following years, however, the membership fell to about 5,000,000 or 40 per cent of the wage earners, as a result of post-war conditions and unemployment. The Trade Union Congress, the national organization of the British trade-union movement, reported 2,860,077 members in 1914; 6,505,482 in 1920; and 4,352,818 in 1923. Far more significant than their numerical increase was the growth of the influence of the British trade-unionists, which may be measured by the fact that in 1924 the Labor Party, which is primarily the political expression of British trade-unionism, became the governing party. Another feature of this great development was the tendency to form large labor aggregations. The movement for "less unions and more unity" through amalgamation

brought the majority of the British trade-unionists into relatively few and large bodies, such as the Miners' Federation (750,000 members), the National Union of Railwaymen (327,000), the General Labor Union (500,000), the Amalgamated Transport Workers (1,000,000), the Amalgamated Engineering Union, and the United Textile Factory Workers' Association. At the outbreak of the War, British labor agreed to a general truce between labor and capital. The miners, who had not abrogated their freedom to act, showed an independent attitude throughout the War. The rebellious spirit of British labor manifested itself, however, through unofficial strikes and through the widespread acceptance of various theories of industrial unionism, syndicalism, and industrial democracy. The establishment of Whitley Councils in various trades by the Government was a concession to this spirit. This unrest did not abate with the Armistice. Guild socialism spread in the years after the War and the miners made their demand in 1919 for the nationalization of mines which resulted in the Coal Commission and the Sankey Report. In 1920, at the time of the Russo-Polish conflict, the trade unions formed councils of action and by this direct method exerted successful pressure on the British government in favor of nonintervention.

But unemployment, dissension between rights and lefts, the unfortunate end of the miners' strike, and the passage of repressive legislation following the end of the general strike (see GREAT BRITAIN, under *History*) contributed to a decline in membership following 1924. At the 1924 Trade Union Congress, 4,328,000 trade-unionists were represented, at the 1927 Congress, 4,163,994, at the 1928 Congress, 3,874,800. During the five years, 1924-29, labor showed an increasing tendency to eliminate the Communists from its body (though it favored recognition of Russia) and to cooperate with capital in the overhauling of industry. The greatest blow struck at organized labor was the passage, by the Conservative government, of the Trades Dispute and Trade Union Act in July, 1927, as a result of the unsuccessful general strike of 1926. This act practically deprived organized labor of the safeguards it had won since the Taft-Vale decision. The act declared 1. That a strike was illegal if it had any object other than the furtherance of a trade dispute, a strike was illegal if it was calculated to coerce the Government. 2. No trade union might discipline a member for refusal to take part in an illegal strike. 3. Picketing was forbidden. 4. Trade unions might make political levies on their members only if they had consent in writing. 5. Civil servants might not join a general trade-union organization. (Reference was had to the English Trade Union Congress.) 6. Local authorities might not make membership in trade unions a condition for employment. 7. The attorney general might enjoin trade-union funds if they were being used in contravention of the act.

TRAIN. See ARMIES AND ARMY ORGANIZATION.

TRAIN, ARTHUR (CHENEY) (1875-). An American lawyer and writer, born at Boston, Mass., and educated at Harvard University and its law school. He practiced for several years in New York and was assistant district attorney there (1901-08, 1914-15). He was a fiction writer of considerable talent, his books including:

The Man Who Rocked the Earth (1915); *The Earthquake* (1918); *Tutt and Mr. Tutt* (1920); *The Hermit of Turkey Hollow, By Advice of Counsel*, and *As it Was in the Beginning* (1921); *Tut, Tut, Mr. Tutt! and His Children's Children* (1923); *On the Trail of the Bad Men* (1925); *Page Mr. Tutt!* (1926); *The Blind Goddess* (1926). *Ambition* (1928); *The Horns of Ramadan* (1928).

TRANSCAUCASIAN SOVIET REPUBLICS, FEDERATION OF. See RUSSIA; ARMENIA; AZERBAIJAN, GEORGIA.

TRANSFORMERS. See ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.

TRANSJORDANIA, EMIRATE OF, or KERAK. A territory inhabited by Arabs, lying to the east of the Jordan and to the north of the Kingdom of Hedjaz. Area, undetermined; population, estimated at 260,000, of whom 220,000 are Arab Moslems, 30,000 Arab Christians, and 10,000 Caucasians. Amman, the capital, had 2300 inhabitants. Other towns are Kerak (2500), Es Salt (8000), Ma'an (3000), Madeka (2000), Jerash (1500). The country is for the most part desert, except for the 30-mile district between the Jordan and the Hedjaz Railway. The population being largely nomadic, pastoral pursuits are the leading activity. Phosphate deposits have been found, as well as potash, in the Dead Sea. Communications are maintained by a motor road from Amman to Jerusalem and by the portion of the Hedjaz Railway running through the country from Daraa to Ma'an. The estimated revenue for 1928-29 was £240,916, the estimated British grant-in-aid, £40,000. The country played a prominent part in the Crusades, then with the defeat of the Christians fell to a series of independent rulers who came out of Egypt. Under the Ottoman Turks (1517-1918), its part was an obscure one until the building of the Hedjaz Railway made it easily accessible. In April, 1918, it was invaded by the Emir Feisal, and by the Peace Treaty it was made part of the Palestine mandate under the supervision of the British high commissioner. Emir Feisal, as ruler of Syria, was recognized as sovereign in Transjordan, but after his fall, his brother, the Emir Abdullah, was set upon the throne (April, 1921). In May, 1923, local autonomy was formally granted the Territory by the British High Commissioner in Palestine. A treaty for the establishment of a semi-independent constitutional government under Emir Abdullah was signed in Jerusalem Feb. 20, 1928. Numerous Arab leaders protested against features of the treaty providing for a virtual British protectorate. The Legislative Council assembled for the first time in November, 1928. See PALESTINE.

TRANSVAAL PROVINCE. See SOUTH AFRICA, UNION OF.

TRANSYLVANIA, trăn'sil-văn'l-a. Before the World War, an integral part of Hungary, but since December, 1918, a Rumanian province. Area, 22,312 square miles, population in 1915, 2,678,367. Cluj (Klausenburg), the principal city, had an estimated population of 65,500 in 1920. The inhabitants in 1910 were divided racially as follows: 55 per cent Rumanian, 34.3

per cent Magyar (known locally as Szeklers), 8.7 per cent German (i.e., Saxons). There were also some Ruthenians and Slovaks. Among all these, the Jews numbered about 65,000. The people pursue for the most part agricultural and pastoral activities, the industrial life occupying only a small place. The Rumanians are chiefly peasants, herdsmen, and hillsmen, largely illiterate, and culturally and economically completely dominated by their Magyar overlords. The limit of Transylvania, on the edge of the Rumanian forelands, coincided with a number of important towns in the Bánát, i.e., Arad, Temesvár, and Nagy Varad, and it was to gain these towns, so important as focal points to the surrounding agricultural country, that Rumania sought the inclusion of the Bánát in her territories. On Dec. 2, 1918, a Transylvanian Assembly, perceiving how imminent was the disruption of the Dual Monarchy, declared its union with Rumania. On Jan. 11, 1919, Rumania by royal decree annexed the territory, the subsequent treaties confirmed the transfer. In 1920 the Transylvanian National Council was dissolved and a provincial government was erected. The University of Cluj, founded in 1919, had 1980 students in 1920. See WORLD WAR, *Balkan Front*.

TREATY OF LONDON (APR. 26, 1915). See WORLD WAR, DIPLOMACY OF THE; PEACE AND PEACE MOVEMENTS.

TREBITSCH, SIEGFRIED (1869-). An Austrian poet, novelist, and dramatist, born in Vienna. His works include the plays *Ein Muttersohn* (1911); *Gefährliche Jahre* (1915); *Frau Gittas Sühne* (1920, translated into English by George Bernard Shaw); *Der Geliebte* (1923). *Das Land der Treue* (1926); the novels *Das Haus am Abhang* (1905), *Spätes Licht* (1918); the poem *Wellen und Wege* (1913); the short stories *Weltuntergang* (1902), *Genesung*, *Tagwandler* (1909), *Der Gekelte* (1927).

TREES. See FORESTRY.

TRELEASE, WILLIAM (1857-). An American botanist, born at Mt. Vernon, N. Y., and educated at Cornell, Harvard, Michigan, and Washington universities. He was instructor in botany at the University of Wisconsin (1881-85); professor of botany at Washington University (1885-1913), and at the University of Illinois (1913-26). From 1889 to 1912, he was director of the Missouri Botanical Garden. Professor Tielease wrote *The Genus Phoradendron* (1916); *Plant Materials of Decorative Gardening* (1917), *Winter Botany* (1918); *The American Oaks* (1925); and many papers and reports on botany and entomology.

TRENCHARD, SIR HUGH MONTAGUE (1873-). Marshal of the Royal British Air Force (since 1927). He entered the army in 1893, served in Africa through the Boer War, and became assistant commandant of the Royal Flying Corps at Upavon in 1913. Before the end of the first year of the World War, he was made head of the military wing of the air forces under Sir John French, in which office he was markedly successful. By 1916 he was a major general, and in January, 1918, he went back to England as chief of staff of the newly formed Air Ministry. He resigned in April, 1918, and shortly afterward was given the command of the Independent Force and raided German territory. In 1919 he was made air marshal and became chief of the air staff. He was principal air aide-de-camp to the King (1921-25), air chief marshal (1922), senior member of the air

council, and was given his present title in 1927. He received many decorations and honors, and an honorary LL.D. from Cambridge, and a D.C.L. from Oxford.

TRENCH WARFARE. Trench warfare was a development peculiar to the War in Europe. The line of battle extended from the English Channel to Switzerland, its flanks resting on militarily impregnable obstacles which precluded outflanking. The numbers engaged made the battle lines practically continuous, reduced the chance of success of a war of manœuvre, and eventually resulted in the deadlock inevitable to a war of position when the opposing forces are evenly matched. A recurrence of trench warfare of the sort experienced in the War will depend on the likeness of the conditions of any future conflict to those just described. See ORDNANCE.

Trench Mortars. The trench mortar, in its simplest form, consisted merely of a seamless drawn-steel tube three inches in diameter, closed at one end and provided with a projecting firing-pin at the closed end. A simple tripod, which with the tube itself constituted a tripod, gave elevation and direction to the tube. In action, a very simple form of projectile consisting of a lap-welded three-inch steel tubing, filled with nitro-starch explosive and provided at its lower end with means for attaching an ordinary shot-gun shell, was dropped gently down the muzzle. When the primer of the shot-gun shell struck the projecting firing-pin at the bottom of the closed tube, the cartridge was discharged, and the shell was thrown with considerable velocity in a high arc for several hundred yards. In order to obtain greater range, rings of ballistite were wrapped around the shot-gun shell and were ignited on its discharge. Light vanes, added in prolongation of the shell body, surrounded the shot-gun shell in order to prevent tumbling of the projectile in flight. This material was indeed ordnance reduced to its simplest terms, but due to the simplicity of design and ease of manufacture, the readiness with which troops could be trained in its employment, and its adaptability to the peculiar conditions of trench warfare, it found an enormous use. Three-inch and four-inch Newton-Stokes mortars of British design, in general conformity to the above description, were used to a great extent by the American Expeditionary Forces. Provided with more accurate elevating and traversing mechanism and separate propelling charges, six-inch Newton-Stokes and French 240-mm mortars were also used to a considerable extent. See STRATEGY AND TACTICS, MILITARY.

The Livens projector, of British design, was essentially a long steel tube, closed at one end, intended to be buried in the ground, and supported by a pressed-steel base plate. These tubes were set up in groups of 25 or multiples thereof and were fired simultaneously by electricity, sometimes to the number of 2500. The projectile used was a gas drum cylindrical in shape, about 24 inches long and eight inches in diameter; and when fired in large numbers, it worked great havoc in the ranks of the enemy. Although the British used this type with great success throughout the latter period of the War, and the French and Americans also adopted it and used it freely, the Germans were never able to discover the nature of the device which was causing such damage and were never able to produce anything similar to it.

Pyrotechnics. Pyrotechnics found very ex-

tensive use in the War. The exigencies of trench warfare frequently demanded the transmission of orders and information simultaneously by several different methods. In order to supplement the telephone, telegraph, and visual signaling, fire signaling was resorted to, and pyrotechnic devices were developed to meet all needs, including signal rockets, parachute rockets, signal pistols and their ammunition, position and signal lights, flares, smoke torches, and lights to be thrown by the Viven-Bessière tromblon, the French device attached to the end of the rifle in which a rifle grenade fits.

Pyrotechnics won themselves a reputation as a dependable means of communication when all other means, except by runners, were interrupted, and it is probable that they will find a continuing place in the liaison systems of all armies. After the War, considerable attention was devoted to producing pyrotechnic signals which would be entirely dependable as to functioning, could stand rough handling, and would not deteriorate after storage under field conditions. Airplane flares, to be dropped from air craft for the illumination of No Man's Land, have been developed since the War to give a candle power of 400,000 and a burning time of three minutes, with a larger size having a candle power of 800,000 and a burning time of four minutes. Wing-tip flares giving a candle power of 40,000 and burning time of two minutes also have been developed for use by aviators attempting to make forced landings at night or on fields not otherwise illuminated.

TRENGGANU. See MALAY STATES, NON-FEDERATED.

TRENTINO. See TYROL, GERMAN SOUTH; WORLD WAR, *Italian Front*.

TRENTON. The capital of New Jersey. The population increased from 96,815 in 1910 to 119,289 in 1920 and to 139,000 in 1928 by estimate of the U. S. Bureau of the Census. In 1924 a comprehensive zoning ordinance was adopted. Trenton is at the head of navigation on the Delaware River and has a municipal dock with wharves and a warehouse built and owned by the city. In 1921 a State office building was erected, and between 1923 and 1926, the Pennsylvania Railroad spent approximately \$1,000,000 in enlarging its Clinton Street station. The school-building programme since 1914 has included the erection of a grade school, two high schools, and a junior high school. By 1928 Trenton had 31 public schools, 15 parochial schools, and 4 private schools valued at \$3,700,000. In 1927 the State park on the Delaware River at Washington's Crossing was set aside as a public park and monument. The area of park property within the city covered approximately 250 acres and was valued at \$1,600,000. In 1929 a memorial building, to cost more than \$1,500,000, was planned to be erected in Stacy Park. In 1927, 19,965 persons were employed in approximately 285 industrial establishments in Trenton and received \$25,887,303 in wages, the value of products manufactured was \$107,416,599. The airport owned by Mercer County is located on the airmail route from New York to Atlanta. The clearings of Trenton's 11 banks increased from \$183,000,000 in 1921 to \$342,917,000 in 1928. The assessed valuation of property in 1928 was \$203,487,063, the net debt was \$12,938,003. The city celebrated the 250th anniversary of its founding in October, 1929.

TREVELYAN, tre-vělyan, GEORGE MACAU-

LAY (1876—). A British historian (see VOL. XXII), who was formerly a fellow of Trinity College, Cambridge, and became Regius professor of modern history there in 1927. He served in a British ambulance unit in Italy during the World War, and was twice decorated by that country. He was a fellow of the British Academy, a commander of the Order of the British Empire (1920), and held honorary degrees from Edinburgh and Durham Universities. His later works include *Scenes from Italy's War* (1919); *Recreations of an Historian* (1919); *Lord Grey of the Reform Bill* (1920); *British History in the Nineteenth Century, 1782-1901* (1922); *Mann and the Venetian Revolution of 1848* (1923); *The Historical Causes of the Present State in Italy*, Sidney Ball Memorial Lecture (1923); *The Two-Party System in English Political History*, Romanes Lecture (1926); *History of England* (1926); *The Present Position of History*, an inaugural lecture at Cambridge (1927); and *Walking* (1928). In 1928 he edited *Select Documents for Queen Anne's Reign down to the Union with Scotland, 1702-07*.

TREVELYAN, tre-vělyan, SIR GEORGE OTTO (1838-1928). A British historian (see VOL. XXII). A new edition of his *Life and Letters of Lord Macaulay* appeared in 1923. Sir George died on Aug. 16, 1928, in his ninety-first year. His successor in the baronetcy is his eldest son, Charles Philips Trevelyan, M.P., Minister for Education in the MacDonald government. Another son, George Macaulay Trevelyan, is Regius professor of modern history at Cambridge.

TREVES, SIR FREDERICK (1853-1923). A British surgeon (see VOL. XXII). During the World War, he was president of the Headquarters Board at the War Office and a member of the Advisory Board of the Army Medical Service. His *Surgical Applied Anatomy* passed through its seventh edition in 1918. His chief contribution to literature since 1914 is a book of reminiscences, *The Elephant Man* (1923).

TREXLER, SAMUEL (GEISS) (1877—). An American Lutheran clergyman, who was born at Bernville, Pa., and graduated from Muhlenberg College at Allentown. He pursued his theological studies at the Lutheran Theological Seminary, Philadelphia, and was ordained to the Lutheran ministry in 1899. He organized the Messiah Church of Brooklyn, N. Y., and was pastor of it until 1912. During the next two years he organized religious work among Lutheran students at Columbia, Harvard, Yale, and Cornell universities. From 1914 to 1920, he was pastor of the Church of the Redeemer at Buffalo, N. Y. Since 1920 he has presided over the Synod of New York and New England, which in 1929 became the United Lutheran Synod of New York by a merger. In the World War, he was a chaplain of the U. S. Army in France and Germany. He is the author of *Crusaders of the Twentieth Century* (1926).

TRIANON, TREATY OF THE. See PEACE CONFERENCE AND TREATIES; HUNGARY, under *History*.

TRIESTE. See FIUME-ADRIATIC CONTROVERSY.

TRINIDAD, trīn'ī-dād. An island in the West Indies north of the mouth of the Orinoco, constituting with the island of Tobago (114 square miles) a British colony. Area of Trinidad, 1862 square miles; population in 1911, 333,552, estimated in 1928, 391,705. The largest city, Port of Spain, had 65,016 inhabitants in 1928

(60,000 in 1911). In 1920 Trinidad was chosen as the seat of a West Indian agricultural college. The leading products continue to be the following as indicated by export values in 1927: cacao, £1,671,883 (1913, £1,403,379); petroleum, £1,310,356 (1913, £75,020); petrol spirit, £951,606; sugar, £702,366 (1913, £418,007); asphalt, £464,475 (1913), £230,665; copra, £146,895. Petroleum has made great advances, production in 1927 amounting to 5,380,464 barrels. Imports for 1913 were worth £2,828,550; for 1920, £8,490,232, for 1921, £6,903,694; for 1927, £5,082,871. Exports for the same years were £3,065,863, £8,408,611, £4,683,988, £6,018,864. Transshipments for the same years were £2,139,810, £1,077,034, £509,988, £707,152. The principal imports in 1927 were flour, rice, cotton, and metal manufactures, fish, machinery, motor cars, and other vehicles. The bulk of imports were from the United Kingdom, United States, and Canada. Exports went principally to the United Kingdom, United States, France, and Canada. In 1927 there were 123 miles of railway, as compared with 95 in 1914. Government accounts follow for 1927 (1913-14 figures in parentheses) revenue, £1,686,053 (£970,789); of which customs was £676,400 (£433,276); expenditure, £1,497,024 (£951,962); public debt, as of Dec. 31, 1927, £3,281,854 (£1,476,615).

TRINITY COLLEGE. An institution for the higher education of men at Hartford, Conn., founded in 1823 as Washington College by members of the Protestant Episcopal Church. The present name of the college was adopted in 1825. The enrollment in 1914 was 248, in 1928, 276. The faculty numbered 27 in 1914 and 34 in 1928 and in this period the library was increased from 70,000 to 100,000 volumes. The productive funds in 1928 were \$3,070,385.06. The library and administration buildings, the gift of J. P. Morgan, were completed in 1914, and a gift of \$150,000 was received by the college from the J. P. Morgan Fund in 1917. In 1923 the centennial celebration was held and the centennial fund of \$1,000,000 was completed. President, Remsen Brinckerhoff Ogilby, Litt D., LL D.

TRINITY COLLEGE. An institution of learning in Durham, North Carolina, expanded into Duke University in 1924. See DUKE UNIVERSITY.

TRINITY COLLEGE. A Roman Catholic institution for women founded in 1897 at Washington, D. C., by the Sisters of Notre Dame of Namur, it is affiliated with the Catholic University of America. The number of students increased from 166 in 1914 to 368 in 1927-28 and to 397 in the autumn term of 1928, the number of members in the faculty from 26 to 48, and the volumes in the library from 16,000 to 34,000. The endowment in 1928 was \$1,500,000; buildings were valued at \$3,056,000; grounds (50 acres of campus) at \$195,000, and total income for 1927-28 amounted to \$366,000. The Stewart estate adjoining the campus was bought in 1915; the Chapel of Notre Dame was dedicated in 1924; and in October, 1928, a new dining hall was opened, which in addition to two large dining halls, accommodating 250 each, and a spacious cafeteria, provides private rooms for 70 students. President, Sister Raphael, A.B., M.D.

TRIODE. See RADIO TELEGRAPHY.

TRIPLE ALLIANCE. See WORLD WAR.

TRIPLE ENTENTE. See WORLD WAR.

TRIPOLITANIA. See LIBYA.

TROELTSCH, ERNST D. (1865-1923). A

German religious philosopher, born at Augsburg, and educated at the leading German universities. He was called to a professorship in the University of Berlin in 1912. At the close of the World War, he entered politics under the Democratic standard. In 1920 he became Minister of Education and Religion in the Prussian state government, and in 1921 he was appointed to the same office in the German federal cabinet. His writings are concerned largely with the philosophy of Protestantism. They include: *Soziallehren der Christlichen Kirchen und Gruppen* (1912), *Zu Religions Lage, Religions Philosophie und Ethik* (1913); *Augustin* (1915); *Deutsche Zukunft* (1916); *Humanismus und Naturalismus* (1916); *Geschichte der Philosophie des Positivismus* (1919); *Die Dynamik der Geschichte* (1919); *Die Bedeutung des Protestantismus für die Entstehung der modernen Welt* (1924); *Zur Geistesgeschichte und Religionssoziologie* (1925), and *Deutscher Geist und Westeuropa* (1925).

TRONDHJEM. A city in Norway the name of which was to be changed to Nidaros, Jan. 1, 1930. See NORWAY, under *History*.

TROPISMS. See ANIMAL PSYCHOLOGY; ZOOLOGY.

TROTSKY, LEON DAVIDOVITCH (LEON BRAUNSTEIN) (1879-). A Russian Communist leader born near Elisavetgrad, South Russia, and educated at the University of Odessa. Becoming a member of the left wing of the Social-Democratic Party he was arrested for his political activities in 1898 and deported to Siberia. He escaped in 1902, returned to Russia to aid in the revolution of 1905, was again arrested, and again escaped en route to Siberia. He was active in the international Socialist movement in the years preceding the World War and severely criticized Socialists who supported their governments in the conflict. During the War, he was expelled from France, Switzerland, and Spain and in 1917 went to New York City, where he helped publish the Russian newspaper, *Norv Mir*. He returned to Russia after the Menshevik Revolution of March, 1917, was elected President of the Moscow Soviet, and played a leading rôle in the October revolution which placed Lenin in power. Appointed the first Soviet Commissar for Foreign Affairs, he conducted the peace negotiations at Brest-Litovsk but resigned rather than sign the treaty. As Commissar for War (1919-25), he organized and trained the Red Army, but he came increasingly into conflict with Joseph Stalin, Secretary-General of the Central Executive Committee, and early in 1925 was exiled to the Caucasus for some months.

In May, 1925, he was appointed head of the technical and scientific department of the Supreme Council of National Economy, and of the Central Electric Trust and the Committee of Concessions, all relatively unimportant posts. Elected to the Political Bureau of the Communist Party in 1926, he was expelled from the office the same year for his continued opposition to the policies of the Stalin majority. In 1927 he was expelled from the Executive Committee of the Communist International, along with 98 other opposition leaders, and then from the party itself. Early in 1928 he was exiled to the village of Vienne on the Russo-Chinese frontier, where he set forth his side of the controversy with Stalin in a book, *The Real Situation in Russia*, translated into English by Max Eastman (1928). In January, 1929, he was banished from Russia and went to Constantinople where he was

forced to remain because of the refusal of other European countries to admit him. Soon after his arrival, he published a series of articles upon the situation in Russia. *My Life*, an autobiography, appeared in 1929.

TROUBETZKOI, PAUL (1866—). An international artist and sculptor, born in Intra, Italy, of Russian parentage. Virtually self-educated in art, he attracted attention as early as 1887, when some of his animal figures were exhibited at the Venice Exposition. Later, he worked in Russia, France, and America, and his sculptures have found their way into all of the principal European galleries. He designed the monument to Czar Alexander III in St. Petersburg, an equestrian statue, "Pellerossa," is in the Museum of Modern Art in Rome, and equestrian figures of Alexander III of Russia and of Tolstoi are in the Luxembourg Museum. He executed also "Study in nude," statues of Caruso and Gabriel d'Annunzio, and a bust of Segantini. His art was distinguished for his ability to make figures of stone and metal seem to breathe and palpitate with life.

TROWBRIDGE, AUGUSTUS (1870—). An American physicist, born in New York City and educated at Columbia University and in Berlin. During 1898-1900 he was instructor in physics at the University of Michigan and in 1900-06 a member of the faculty at the University of Wisconsin; from 1906 to 1925, he was professor of physics at Princeton University. During the World War he served in the U. S. Army Intelligence Department in France with the rank of lieutenant colonel. He received the Distinguished Service Medal and the Distinguished Service Order, as well as the decoration of the Legion of Honor. He is a member of the National Academy of Sciences and was chairman of the division of physical sciences and member of the fellowship board of the National Research Council (1920-21). He served as European director of Science International Education Board, 1925-28. Since 1928 he has been dean of the Graduate College, Princeton University.

TRUSTS. The year 1914 was important for students of trust legislation. During this year, two noteworthy acts were passed by Congress, the Federal Trade Commission Act and the Clayton Act. The Bureau of Corporations which went into operation in 1904 had been rendering very distinct aid in the curbing of certain evils in the trusts. The creation of the Federal Trade Commission was a direct outcome of the Bureau of Corporations. The chief provisions of the Trade Commission Act follow: (1) A Federal Trade Commission of five members appointed for seven years at an annual salary of \$10,000 each was created. (2) The act specifically condemned as unlawful unfair competition by industrial combinations. (3) The principal duty of the Trade Commission was to take action against unfair practices when it was convinced that such existed. The commission was to serve a complaint and hold a hearing and was authorized to order the discontinuance of any practices found to be unfair. In case the order of the commission was not obeyed, it had the power to lay the case before the Circuit Court of Appeals. The court might issue an injunction. The decision of the commission was greatly strengthened by the fact that its findings, if supported by adequate testimony, were regarded as conclusive. (4) The power of the commission was extended to include the investigation of corporations engaged in inter-state

commerce, with the exception of banks and common carriers. (5) The commission was authorized to demand from corporations annual reports and other information relative to the conduct of their business. (6) It might initiate investigations relative to the manner in which previous decrees had been carried out by industrial combinations. The Commission might publish its findings if it seemed in the public interest. (7) On direction of the President or of either house of Congress, or on application of the Attorney General, the commission was required to investigate any alleged violations of the anti-trust acts and to recommend such changes as should bring the practices into conformity with the requirements of the act. (8) If the Federal Court made the formal request, the Federal Trade Commission might act in an advisory capacity, relative to the form which the decrees of the court should take. The purpose of the Federal Trade Commission Act was to prevent unfair practices of industrial combinations rather than to inflict punishment when such practices occurred. The power of the Federal Trade Commission was made, under the provisions of the act, much more definite and real than that of any previous governmental body created for the purpose of regulating industrial combinations.

The Clayton Act contained, first, a series of prohibitions against local price discriminations, holding companies, tying contracts, and interlocking directorates, secondly, a statement of the remedies to be applied, and thirdly, a defining of the position which labor was to occupy under it. Price discrimination, where the effect might be to lessen competition or to create a monopoly, was declared unlawful. This provision was not intended to interfere with bona fide transactions and the selection of customers. Any exclusive selling or leasing contracts whose effect was to limit competition was declared unlawful. "The acquisition of stock in one corporation by another, or the combination of two or more corporations through stock ownership, where the effect 'may be specifically to lessen competition, . . . to restrain . . . commerce, . . . or to tend to create monopoly' is prohibited." Interlocking directorates were prohibited, provided the object of forming such a directorate was to restrain competition by combination in a way not permitted by the act. The violation of any of the measures of the act was considered the definite responsibility of the individual directors, officers, or agents who authorized or permitted the acts constituting such violation. It was definitely declared in the act that all laws relating to combination were not to apply to combinations of labor. The courts were forbidden to issue injunctions in labor disputes unless necessary to prevent irreparable damage. Trials for contempt of court in labor cases was to be by jury, except when the contempt was committed in the presence of the court.

In foreign countries, combinations are not forbidden either for domestic or foreign trade. For this reason, industrial enterprises in the United States are at a distinct disadvantage in competing against foreign corporations. After the Clayton Act was passed in 1914, many writers called attention to this handicap under which American exporters labored. The result was the Webb-Pomerene Act of 1918, which was sponsored by President Wilson. This law permitted the American exporters to combine for the purposes of foreign trade on the condition that they file an

nual reports with the Federal Trade Commission regarding the character of their enterprises.

Under the existing legislation relating to trusts, the Sherman Act of 1890 and the Clayton Act and Federal Trade Commission Act of 1914, many important suits were fought in the courts. The work of the commission had not been generally spectacular, but it had rendered real service in checking unfair practices and discouraging combinations likely to affect public welfare unfavorably. A few cases are outstanding both in importance and in public interest. Chief among these was the *United States v. the United States Steel Corporation*. The Government brought suit against this giant combination on the ground that it was a monopoly and was engaged in unlawful restraint of trade. The decision of the District Court, rendered in October, 1911, was favorable to the corporation. The decision of the Supreme Court was not rendered until March, 1920; in effect it was that the United States Steel Corporation had not used aggressive measures against its competitors and that the corporation did not possess full monopolistic advantages. The majority decision of the members of the Supreme Court was definite in its statement that mere size does not necessarily mean monopolistic powers. While the United States Steel Corporation was much larger than any of its competitors, it was not in a position to dominate prices of steel products, for the value of its output was not as great as the total value of all its competitors combined. The great argument was that the object of anti-trust legislation was to condemn monopoly and unfair methods of competition. The corporation could not be condemned on either count. The majority opinion of the judges was that the public interest would suffer more if the corporation should be compelled to break up into smaller units. Certain practices in which the corporation had indulged for the purpose of maintaining prices were condemned. Certain pools, associations, and gentlemen's agreements had been formed with the competitors of the trust, but they had not been successful and had been abandoned nine months before suit was brought. The court held that the formation of such price agreements was proof that monopolistic advantage did not exist. Four judges were in favor of the decision outlined above, and three dissented. Two judges did not vote; one had previously been associated with a proceeding against the corporation, and the other had publicly expressed the opinion that the corporation was using unlawful methods.

Another important action of the late years of the decade against industrial combination was that of the meat packers of Chicago. In 1910 suits were brought against the National Packing Company, an organization holding certain independent properties which had been acquired by the Swift, Morris, and Armour companies. The board of directors of this company was made up of representatives of the three large packing firms. In 1912, while under fire, the National Packing Company was dissolved by the members themselves, and its assets were distributed among the three companies involved. The extent to which this dissolution actually restored competitive conditions was not generally known. In December, 1919, a decree was issued which materially affected the packers, known as the "Big Five" (the Armour, Swift, Morris, Wilson, and Cudahy companies). Under threat of a suit for dissolution, the "Big Five" agreed to a decree

enjoining certain practices which were considered opposed to the public interest. The decree of the court was entered on Feb. 27, 1920. It provided that the "Big Five" were forbidden perpetually to form any contract or combination in restraint of inter-state commerce. The companies concerned were forbidden to own stock in any stockyard market in the United States or in any stockyard terminal railroad in the United States.

The defendants were enjoined from carrying on either directly or indirectly the manufacture, jobbing, selling, or distributing of a large number of commodities, including vegetables, confectionary, fish, soft drinks, preserves, coffee, tea, chocolate, flour, and sugar. The exception permitted was when these commodities were utilized by the defendants in carrying on their business as packers. From this part of the decree, it is obvious that the "Big Five" were entering other lines of endeavor and had acquired considerable influence on the prices of foodstuffs in different localities. The packers were also enjoined from owning or operating in the United States any markets except those located at their plants. They were also forbidden to own stock in public cold-storage warehouses and to engage in the business of buying and selling fresh milk and cream. In 1929 the packers announced they were preparing to enter the courts to seek the dissolution of the consent decree on the score that the recent growth of chain-store enterprises no longer made monopoly possible, certainly not in the retailing of foodstuffs.

Following the famous decision in the *U S Steel Corporation* case, the "rule of reason" was applied by the district court for the Southern District of California when it enjoined the Southern California Wholesale Grocers' Association (1925) from carrying on practices that were in restraint of trade. In 1926 the Department of Justice gained from a district court consent to order the dissolution of the Ward Food Products Corporation, which up to that time was only laying plans for the perfection of its organization. Interestingly enough, the corporation consented to the decree with the result that the case was not pressed further. In June, 1927, the Supreme Court refused to order the dissolution of the International Harvester Company, applying again the "rule of reason," i.e., that the corporation was not acting in unreasonable restraint of trade though it controlled 64 per cent of the harvester-machinery business. The courts have paid considerable attention to sections 2, 3, 7, and 8 of the Clayton Act and have construed these strictly except in the matter of the resale of commodities. With regard to section 5 of the Federal Trade Commission Act (which prohibits all unfair competitive practices), the Supreme Court has held that it alone may define what is or is not an unfair practice (253 U. S. 421). In a series of decisions handed down over the period being surveyed, the Court enumerated various kinds of unfair practices, e.g., false advertising, misbranding, misrepresentation of product, resale-price maintenance, maligning competitors' products, etc.

Section 6 of the Clayton Act, which has been hailed as the magna charta of the American labor movement in that it exempts labor organizations from "being held or construed to be illegal combinations or conspiracies in restraint of trade, under the anti-trust laws" was reaffirmed in the Appropriation Act of 1927. The same section also exempts agricultural and horticultural or-

ganizations, but in the Capper-Volstead Act of 1927, this immunity was hedged about when certain conditions were laid down as to membership and limited profits.

It is interesting to note how the exporting of commodities has been aided by the Webb-Pomerene Law, above referred to. By 1928, 156 such associations had filed their charters and by-laws with the Federal Trade Commission. In 1928 the number on file, indicating active associations, was 56. These associations had a total membership of about 800 concerns; including mining companies, packing houses, mills, refineries, etc. The total value of exports by these associations has been as follows for certain years: 1919, \$75,000,000; 1925, \$165,200,000; 1926, \$200,500,000; 1927, \$300,000,000. Some of these associations represent the entire exports of the industries for which they stand, e.g., the Redwood Export Company, the Sulphur Export Corporation, Copper Exports, Inc. The Steel Export Association of America controlled from 75 to 80 per cent of the country's steel exports. In 1924 the Federal Trade Commission handed down a ruling by which on association for price fixing, without necessarily being a selling organization, was legal. The result was that most of the associations formed after 1924 were created for price-fixing purposes purely because the member companies had their own sales agencies.

Status of Trusts, 1929. The post-war period saw trusts on the increase in the United States, where they took on the form of large corporations. Recent examples have been the Radio Corporation of America, the Aluminum Company of America, and the Corn Products Refining Company. During the same period, the trade association movement has developed rapidly and in 1929 there were several thousands of these. They existed not only for the exchange of information and for the establishment of public goodwill, but they often appeared to be fixing prices. In fact, the Federal Trade Commission had to order a number of these trade associations to discontinue the practice of price fixing. The Federal Trade Commission, while not crusading in spirit, has pursued its way quietly, studying the methods of corporations and calling unfair practices to the attention of the courts; but for the most part, it seems to have centred its attention on unfair practices in trade, i.e., those which hurt competitors, and not on the disclosing and removal of monopolistic conditions by which the consumer was being affected. Says Jeremiah Jenks, an outstanding authority, on the existence of monopoly in the year 1929: "Everywhere, in manufacturing, distributing, retailing, competition has given way in some degree to industrial monopoly. . . . In reviewing this array of industrial monopolies, we observe several noteworthy circumstances. First, it is significant that so many restraints of competition have been uncovered in our most important industries. Second, it is to be noted that of those trusts proved to have existed previous to the last few years and dissolved as such, comparatively few have been reinvestigated. . . . Furthermore, in a large percentage of the cases in which follow-up investigations have been made, the industry has been found still controlled by a trust in the same or a different form."

TRYGGER, ERNEST (1857-). A Swedish public official and educationist. In addition to serving as chancellor of various Swedish high schools and universities and as president of Uppsala University, he entered politics with his elec-

tion to Parliament in 1898 and became leader of the Conservative Party in the First Chamber. He was also, at various periods in his career, Chief Justice, Swedish delegate to the League of Nations (1921-22), Prime Minister (1923), and Minister for Foreign Affairs (1928-).

TSAO KUN (1865-). President of China Oct. 5, 1922-Nov. 24, 1923. He was born at Tientsin of humble parentage, and as a boy entered the provisional army, where his ability was soon recognized. He attended the Pelyang Military Academy, served in the Sino-Japanese War in 1894, and was director of the Soldiers' Training School at Shiao Chan. In 1911 he assisted in the revolution which overthrew the Manchu dynasty and established the Republic. In 1917 General Chang Hsun effected his *coup d'état* which put the young Emperor on the throne, but Tsao Kun and his army, supporting President Li Yuan-hung, forced him out. In 1918 he fought against Dr. Sun Yat-sen's South China Army. Later, he gained control at Peking, and on Oct. 5, 1923, he was elected President. On Nov. 24, 1924, he was forced to resign by Marshal Tuan, who then assumed the office. See CHINA, History.

TUBERCULOSIS. Since 1914 medical views about this affection have undergone numerous and notable modifications. It is known that the mortality has notably lessened, except in some European countries subjected to hardships and underfeeding. The motivation of this improvement has not been so clearly ascertained. Crusades against the disease in the past were based on very imperfect knowledge, such as the assumption of the danger of man-to-man contact in spreading the disease and of the deadly quality of the expectoration. In 1929 the best opinion is that nearly all individuals entertain the bacillus in their tissues when young and that the harboring of this germ, so far from being a menace to later years, induces a process of immunization, in the absence of which a vast number of individuals might develop the disease in active form in adolescence and maturity. It is this immunization which may protect the individual in later life from contact with the bacillus as spread by open cases of tuberculosis. In other words, a strain of mankind without this immunity might develop the disease in a true pestilential form such as has often appeared among aboriginal races.

We are still quite unable to understand why well-nourished and intelligent men and women develop the disease in the absence perhaps of any obvious factor of causation. Trudeau and other phthisiologists state that of a certain number of incipient cases, some are already beyond hope because they simply will not respond to curative measures. It seems doubtful whether this large fraction can ever be salvaged without the discovery of a true specific.

The progress of our knowledge and control of tuberculosis has reached preventive inoculation of young children with the serum devised by Calmette of the Pasteur Institute, Paris. The Hygienic Section of the League of Nations, in its session during October, 1928, took up this subject for discussion. Thus far, the serum has been tested only in some of the Latin countries and to some extent in Norway (where, however, not infants but young schoolgirls were vaccinated). Germany, Great Britain, and the

United States have not yet tested the method. Thirty experts attended the session, comprising bacteriologists, clinicians, and veterinaries. The methods has been tested in certain founding asylums on a portion of the inmates, but the very high mortality inseparable from these institutions makes it difficult to interpret the results. The consensus of opinion has been to the effect that, although the serum is free from danger, it is not wise to vaccinate all infants, but only those which show a strong predisposition and are exposed to infection from their surroundings. The results probably will prove to be better in the domestic animals than in mankind owing to the greater control and simpler living conditions, and much time must elapse before we can speak intelligently of end results.

TUFFIER, THIÉODORE (1857-1929). A French surgeon, a pioneer in the surgery of the thorax, including the lungs, orifices of the heart, arch of the aorta, etc. He was born in Bellême in Orne and was educated in medicine at the University of Paris. Some of his writings are of small compass, the more pretentious comprising *Du Rôle de la Congestion dans les Maladies des Voies Urinaires* (1885); *Études Expérimentales sur la Chirurgie du Rein* (1889); *Chirurgie du Poumon* (1897); *Petite Chirurgie*, with Desfosses (5th ed., 1919); *Travé Médico-Chirurgicale des Maladies de l'Estomac*, with Mattheu and Sencert (1913).

TUFTS COLLEGE. A nonsectarian coeducational institution at Medford, Mass., founded in 1852. The student enrollment was 1223 in 1914, as compared with 2037 in 1928. The faculty increased from 242 in 1914 to 407 in 1928; the library from 72,000 to 93,000 volumes; and the productive funds from approximately \$2,000,000 to \$7,913,501.61. A chemistry laboratory was opened in 1925. President, John Albert Cousens, LL.D.

TULANE UNIVERSITY OF LOUISIANA.

An institution of higher learning, founded at New Orleans, La., in 1834. The student enrollment in 1914 was 2510, as compared with a registration of 2836 in 1928. During that period, the faculty increased from 297 to 412 members; the library from 68,700 to 132,845 volumes, and the productive endowment from \$4,297,987 to \$8,982,001.39. In 1918 Newcomb College for Women removed to its campus adjoining the University and erected three buildings. The cooperative dormitory for women was opened in 1925. A department of journalism was established in 1926; in the same year a concrete stadium seating 25,000 was erected and Dr. Marcus Feingold bequeathed to the University a valuable ophthalmological library. An academic-law building and a dormitory for women were erected in 1927 and a department of social work was established. In 1928 a four-year course in physical education for men and a special course in parasitology were organized, the work in psychology and sociology was expanded and full time instruction in the school of medicine was further developed. A building was erected for the College of Law and additions were made to the faculty. President, Albert Bledsoe Dinwiddie, Ph.D., LL.D.

TULAREMIA. A new disease of the acute, febrile, communicable type recently has made its appearance in the United States, which evidently,

in mankind, is derived from infected food or game animals. At first, the wild rabbit was accused and the persons becoming infected were chiefly meat handlers and others who dressed the game. Later, it was learned that other rodents, such as ground squirrels, wild mice, and even game birds, such as the partridge, could harbor and transmit the disease. It is probable that the rabbit tick is instrumental in diffusing the disease, but, in mankind, transmission direct from the dead animals through infected blood is accused.

Originally a sort of pathological curiosity, tularemia is now recognized as a widespread disease which readily may be confused with ordinary endemic infections, may end fatally, and, in addition, is able to interfere with the marketing of game. Tularemia was at first regarded as the only purely North American disease, although apparently a very similar malady was isolated at about the same time (1924-25) in Japan. The pioneer work has been done by Dr. Francis of the U. S. Public Health Service and the Government at an early date equipped a laboratory for the study of cases at Hamilton, Mont. The insect transmitting the disease to mankind was first thought to be the deer fly ("deer-fly fever") and Francis, who described the disease in 1922, named it from Tulare Co., Calif., where this malady was first recognized.

In a communication from Dr. Francis dated July 2, 1929, is the following succinct account of the disease to date. "The great reservoir of this infection is the wild rabbit. Man readily inoculates himself while dressing infected animals, the infection passing through the skin of his hand. An ulcer results on the latter, followed by enlarged glands at the elbow or in the armpit and fever which confines the patient to bed for two or three weeks. Twenty-four deaths have been reported. Cooks, hunters, housewives, and market men are often infected in November, December, or January, when, owing to relaxation of the game laws, it is permitted to hunt wild cottontail rabbits for food. Persons who skin and cut up jack rabbits for fish or coyote bait, fox, chicken, hog, or dog feed, etc., and for the market frequently become infected. Although a new disease of man, tularemia has abruptly become recognized in 41 States of the United States, in Japan, and in Russia, and has taken its place in the medical literature of every country."

TULSA. A city of Oklahoma. Situated in the centre of a vast and newly-opened oil-producing area, the city increased phenomenally in population from 18,182 in 1910 to 72,075 in 1920 and to 170,500 in 1928, by estimate of the U. S. Bureau of the Census. Between 1919 and 1924, Tulsa County built 150 miles of paved roads radiating in every direction from the city; by 1929, the city had more than 200 miles of paved streets. In 1925 construction was begun on the \$7,500,000 Spavinaw water-supply system which is to bring water 55 miles by gravity from the Spavinaw Dam in the Ozark Mountains to the Mohawk Reservoir, from which it is to be pumped the remaining distance of 4 miles to the city's distributing reservoir. The Mohawk Reservoir, which covered an area of 115 acres, had a capacity of nearly 500,000,000 gallons. The city acquired 2000 acres of land surrounding this reservoir, which it plans to convert into a municipal park and playground. Within the city limits, there are 15 parks covering an area of 3000 acres. The International Petroleum Exposition has been held annually in Tulsa since 1923. The city is

TUNNELS

THE GEORGE A. POSEY TUBE

Oakland-Alameda, California
Beneath the Estuary, or Inner Harbor, of San Francisco Bay

also an important manufacturing centre for oil-field supplies and equipment, and the home offices of a large number of the leading oil and refining companies are located there. In 1927, 2186 persons were employed in 131 industrial establishments and received \$3,404,828 in wages; the value of products manufactured was \$20,300,932. Building permits rose from \$1,194,639 in 1910 to \$14,840,254 in 1927, while bank deposits rose from \$33,000,000 in 1916 to \$105,000,000 in 1928. In 1928 Tulsa had 32 grade schools and 9 high schools, valued at more than \$10,000,000, and two large airports, one privately owned and the other municipally owned. The assessed valuation of property in 1928 was \$118,240,110; the net debt was \$14,758,616.

TUMULTY, JOSEPH PATRICK (1879-). An American lawyer and former secretary to President Wilson, who was born at Jersey City, N. J., and educated at St. Peter's College there. He practiced law in New Jersey and was elected to the New Jersey Assembly in 1907. In 1910 he was appointed private secretary to Woodrow Wilson, then Governor of New Jersey, and clerk of the Supreme Court of New Jersey in 1912. When Mr. Wilson became President of the United States in 1913, Mr. Tumulty was made his secretary and served in that capacity till 1921. His close association with President Wilson made his book, *Woodrow Wilson as I Know Him* (1921), of especial interest.

TUNGSTEN FILAMENT LAMPS. See ELECTRIC LIGHTING

TUNIS, tū'nis, or TUNISIA. A French protectorate in North Africa with an estimated area of 50,000 square miles. By the 1926 census, the population totalled 2,159,708, of which there were 54,243 Jews, 1,932,184 Arabs and Bedouins, 71,020 French, 89,216 Italians, and 8396 Maltese. Total European population was 173,281, a gain of 24,805 over 1911. Populations of large cities were Tunis, the capital, 185,996; Bizerta, 20,593; Feirryville, 4462. Agriculture continues to predominate and show gratifying advances. The 960,000 acres under wheat yielded 255,000 tons in 1927, 187,500 acres under barley, 90,000 tons, 90,000 acres under oats, 21,500 tons. The mean production of dates during 1917-28 was about one million pounds. Olive trees produce about 40,000 metric tons of oil annually. Other products are almonds, oranges, lemons, shaddockes, pistachios, alfa grass, henna, and cork. Important mineral products are phosphates (3,075,000 tons in 1927), and iron (915,000 tons in 1927). Fishing and the sponge industry also are important. Cattle in 1913 and 1927, 157,100 and 501,223; horses, 29,500 and 92,348; mules and asses, 107,700 and 200,528; camels, 123,900 and 155,356; sheep, 843,100 and 2,142,366; goats, 561,700 and 1,380,855. The presence of an agricultural bank and central cooperatives among farmers greatly stimulated the whole industry. The advances made were mirrored in the trade record. Exports for 1913 and 1928 were 178,663,000 francs and 1,336,987,000 francs; imports for the same years were 144,254,000 francs and 1,957,328,000 francs. In 1928 France supplied 71 per cent of the imports and in 1927 purchased 37 per cent of the exports. Revenue in 1928 amounted to 439,542,956 francs and expenditures to 439,430,489 francs. In 1913 expenditures were 85,000,000 francs. The reigning Bey, Sidi Ahmed, succeeded to the throne Feb. 11, 1920. In 1922 an increased share in the government was bestowed on the natives. Five regional councils at Tunis,

Bizerta, Susa, Kef, and Sfax were erected as well as a grand council for the whole protectorate. The latter, made up of two sections, one French and the other native, was given the power to examine the governmental budget. In 1928 there were 441 public and 32 private schools, with 68,150 pupils.

TUNNELS. The period after 1914 was marked by spectacular advances in tunneling, particularly in the United States. While no new methods of great importance were developed, new records for speed and size were established. These tunnels were generally built for railroads and for various water-power, water-supply, and irrigation works, but the development of automobile and motor traffic, which has led to a new era in highway construction, also has produced some remarkable highway tunnels.

Land Tunnels. It will be remembered that for many years the Simplon was the record tunnel of the world. The Simplon still remains the longest tunnel in the world built without an intermediate shaft. Furthermore, in the month of July, 1904, when a single heading in this tunnel was advanced 685 feet, a hard-rock record was established. It is interesting to note that American engineers had been unable even to equal European records, such as the Simplon, and the American technical press frequently commented unfavorably on this subject. In the period just before the World War, however, American records began to rise. In August, 1909, a soft-rock record of 1061 feet in one month was made in advancing the heading in Tunnel 17M on the Jawbone division of the Los Angeles Aqueduct, and in the Elizabeth Tunnel on the same work, an American hard-rock record of 604 feet was established. This latter figure, however, remained a record for only a short time. In the Larumie-Poudre Tunnel (1909-12), it was increased to 653 feet. The St. Louis Waterworks Tunnel increased it to 745, and the Arizona Copper Tunnel, to 799 feet per month. This was followed by the Mount Royal Tunnel at Montreal, Canada (1912-16), in which a heading was advanced 810 feet in 31 days.

It was said that the use of electrical devices in tunneling was responsible for these increases, but this seems very doubtful. It is organization and training which are probably the main elements in speed of drifting. The hardness of the rock, of course, makes a great difference and it is difficult to compare the rock in different tunnels. For example, in the Loetschberg Tunnel, north of the Simplon in Switzerland (1906-11) a maximum monthly rate of 1013 feet was obtained in the north heading, where the rock was soft, whereas only 545 feet was possible in the south heading.

In the Rogers Pass (later named the Connaught) Tunnel on the Canadian Pacific Railroad (1913-16), the engineers of the New World sought a record and secured it with 932 feet advance in one month. In this work, the "pioneer heading" method, which has been used in all subsequent great tunnels where speed was an element, was adopted.

Again in 1923-28, an American record of 777 feet in one month and 33 feet in one day was made in the Moffat Tunnel in Colorado. This work was in large measure overshadowed, however, by the Cascade Tunnel, which, although longer than the Moffat and begun after this tunnel, was finished about the same time, being opened Jan. 12, 1929. This is the longest railroad tunnel in the New World, being exceeded only by the Simplon and other great Alpine

tunnels. The record made in the Cascade Tunnel in the month of October, 1926, of 1157 feet advance for a heading in one month is today the world's record.

It will be noted from this outline of tunneling operations that the "pioneer heading" is probably the principal new departure in long tunnel work and has had much to do with these new records. As indicated above, this plan was first used in the Simplon, although the second heading of the Simplon was not simply a "pioneer" affair, but was later enlarged (1912-22) to a twin tunnel. Indeed, at the Simplon, it was decided to plan for two parallel, single-track tunnels but to cut through the heading of tunnel No. 2 at the same time that tunnel No. 1 was built. The heading of No. 2 was thus connected to the No. 1 tunnel at intervals and was used for the ventilation, drainage, and for handling the excavation and material for tunnel No. 1. The scheme was very successful.

When the Rogers Pass Tunnel was projected, it was planned to build a separate side tunnel which was never intended to be later enlarged or used for any other purpose than as an adjunct to the construction of the main tunnel—the "pioneer tunnel" as a purely construction device was born. Indeed, in this tunnel, the pioneer tunnel or heading was cut about 50 feet north of the main tunnel at the east end and about the same distance south at the west end—it was not even a continuous tunnel on one side of and parallel to the main work. In the pioneer-tunnel method, the pioneer tunnel is carried ahead of the main operation and is connected to the main tunnel by crosscuts at intervals of 1200 to 1500 feet. In fact the crosscuts are made ahead of the main tunnel heading and this heading is actually excavated backward and forward from these advance crosscuts. This, of course, increases speed of work. Furthermore, an even more important advantage is gained through the pioneer tunnel in that the enlargement of the main heading to full tunnel size may proceed at a large number of points without operations interfering with one another or with the progress of the heading.

There was much discussion, at the time the Rogers Pass Tunnel was built, of the relative merits of the pioneer-tunnel plan and also of the central-heading American method versus the European bottom heading. It was generally conceded that the great difference in the cost of labor in America and abroad made the bottom heading with overhead stoping, as used in Europe, uneconomical in America; also that the economy of rapid construction, an economy resulting from putting the work in operation at the earliest possible moment and thus saving interest on the large amounts of capital often involved in great construction, had to be balanced up against the cost of such devices as pioneer tunnels and the admittedly greater cost of rapid excavation due to bonuses, etc. In short, it became clear that the plan of excavation and the organization of the contractor's forces for a great tunnel operation involved an extremely difficult and complicated problem in engineering economics.

There have been no notable changes in tunnel cross-sections in the period under consideration. One of the largest American tunnels from the standpoint of cross-sections is the Niagara Falls Power Tunnel built in 1923 to carry water to Power Plant No. 3 of the Niagara Falls Power Company. This tunnel was 36 feet in diameter in rock, with a concrete lining which reduced this

diameter to 32 feet clear. The Liberty Tunnel at Pittsburgh, a twin-tube vehicular tunnel, was put in operation in 1923 with a section 26½ feet wide. The Mount Royal Tunnel, already mentioned, was a double-track railroad section. In general, the long tunnels, however, have a single track. There has been, however, under construction at Marseilles in Southern France, a canal tunnel which far exceeds all existing tunnels in cross-section. The Rove Tunnel, as it is called, is part of a canal work built to bring directly to Marseilles the Rhone River traffic and avoid the somewhat dangerous open sea trip from the mouth of the Rhone around to Marseilles Harbor. This tunnel is 72 feet wide, 40 feet high, and is also notable in length, 4½ miles. Begun in 1912, the Rove Tunnel was completed in 1927 and was hailed in France as the greatest European engineering work of the century.

In addition to the tunnels mentioned above, there have been other important works such as the Shandaken Tunnel for the New York Water Supply, 18 miles long, the Otrra Tunnel in New Zealand, 5¼ miles long, the Tana Tunnel in Japan, 15 miles long, and other notable works of this class. Detailed descriptions both of these tunnels, and of others above noted, will be found in the editions of *New International Year Book*.

Subaqueous Tunnels. The New York-Jersey City or Holland Vehicular Tunnel under the Hudson is undoubtedly the outstanding subaqueous accomplishment of the period from 1914 to 1928. In 1886 the British engineer, Greathead, had combined for the first time the shield, invented by Brunel in 1818 and improved by Barlow and by Beach in 1869, with the compressed-air process invented by Cochrane in 1830. Using this method, he built the City and South London Subway under the Thames in London clay and water-bearing gravel. The first attempts in New York, now the most tunneled city of the world, were, however, unsuccessful. The New York problem involved tunneling through an almost liquid mass of river silt and mud with considerable depth of water overhead. Ledge rock was also encountered in many of the New York tunnels and was extremely difficult to remove with such a precarious cover over the tube as is afforded by only a few feet of liquid mud.

Perhaps the most important step in advancing the technique of subaqueous tunneling in New York was the discovery, first made in the Hudson-Manhattan Tubes in 1902, that the shield could be forced ahead without completely excavating the material in advance. In practically all subsequent work in New York, this shoving method has been followed. Usually, only about one-third of the material has been actually removed—the tunnel has been forced through the mud displaced by the pressure of the hydraulic jacks operating the shield. The technique of tunneling in New York mud has, therefore, been fully developed.

The Holland Vehicular Tunnel brought into use no radically new methods in subaqueous work. It was simply a striking example of the perfection of this process in modern tunneling. It is notable because both of the two parallel tubes were of extremely large size, 29½ feet outside diameter, were extremely long, 5480 feet between shafts, and were put through with no difficulty in extremely rapid time. The depth of cover over the tubes was also extremely small near the shore where they dipped downward under the river. Here, the old method of covering the river bottom

with a heavy blanket of clay deposited from scows was followed, and, although the air pressure required to balance the outside water pressure at the bottom of the tunnel was practically an atmosphere different from that required at the top, no serious loss of air and no blow-outs occurred. The work was perfectly organized and executed. See JERSEY CITY.

Another method of subaqueous tunnel building, the trench method, also has been brought to a high degree of perfection. The largest subaqueous tunnel in cross-section in the world, the Oakland Estuary Tube, was completed by this method in 1928. It is 3545 feet long between portals and two-thirds of this length is made up of 12 precast segments, practically huge sections of pipe, built in drydock, floated to the site and sunk in position in a trench previously dug in the estuary bottom. In part of the trench, piles were driven to support these sections of the tube, the bottom of which was as much as 90 feet below water level. Generally, the sections simply form forms about which concrete is deposited by tremie tubes from scows at river level. When the tunnel is entirely closed in, the water is pumped out and the interior lining and construction is put in place. The Oakland tube section is 37 feet outside diameter and provides a roadway 24 feet wide. See OAKLAND.

Contracts were let in 1928 for another important tunnel to be built in part by the same method, the Detroit-Windsor Tunnel, a vehicular tunnel to connect Detroit, Mich., with Windsor, Ont. The method is thus well established and is used where river and other conditions make it a more economical construction than the shield and compressed-air process.

Highway Tunnels. It will be noted that the most important of these subaqueous works are highway or vehicular tunnels. The vehicular problem today is, of course, an automobile and motor-truck problem. Ventilation in long vehicular tunnels is therefore a very important element.

An intensive study of the ventilation of vehicular tunnels was made in connection with the Liberty Tunnel at Pittsburgh. This consisted of two tunnels 26½ feet wide and 5715 feet long between portals. This, of course, was a land tunnel through the South Hills, and, while it was found that the amount of carbon monoxide—usually limited to four parts in 10,000—varied with the amount of traffic and movement of vehicles, as well as the direction of the wind, it was clearly demonstrated that forced ventilation was essential.

This problem also received very careful attention in the Holland Tunnel and provision was made for an air inlet in the circular space below the roadway with inlet ports along the curb, and for air outlets in a similar space between the flat roof and the tunnel top. Large ventilating buildings were installed on piers at the river edge and also at each end, about midway between the pier ventilating buildings and the portals. These buildings were completely equipped with ventilating fans of the most modern type and the system has been most satisfactory in service.

Great Tunnel Projects. In connection with subaqueous tunneling, it should be noted that plans are again being discussed for a Channel Tunnel. It would appear that there is at last hope that this much needed tunnel will be built. An investigation also is under way for a tunnel under the Strait of Gibraltar—a very difficult

and costly undertaking because of the great depth to which the tunnel would have to be carried to keep it in sound rock. It would therefore appear that modern methods of tunneling permit the engineer to meet practically any condition of construction or design and that the size of any tunneling operation is largely a matter of business economics—if the project shows an adequate return on computed cost and operating expenses, and if funds can be secured, modern engineering still stands ready to design and construct the project irrespective of length or size.

Bibliography. Recent works in this field include: David W. Brunton, and John A. Davis, *Modern Tunneling*, rev. ed. (New York, 1922) includes new chapters on railroad tunneling by J. Vipond Davies, considerable attention to American practice in tunnel construction being paid B. H. M. Hewett; and S. Johannesson, *Shield and Compressed-Air Tunneling* (New York and London, 1922), as well as the engineering journals.

TUNNEY, GENE (1898-). An American heavyweight boxing champion, who was born in New York City, where he was educated in public and parochial schools. Leaving school at an early age, he became a clerk in a freight office. He first attracted attention in boxing circles by two successful bouts in 1918. Shortly afterward he enlisted in the U. S. Marines and was sent to France, where he won the heavyweight championship of the A. E. F. Returning to the United States, he won the light heavyweight championship from Battling Levinsky, lost it in 1922 to Harry Greb, and won it from Greb the following year. Later, he entered the heavyweight class and won with knockouts over Carpentier, Tommy Gibbons, and Bartley Madden. He succeeded to the heavyweight championship by defeating Jack Dempsey in a 10-round bout at Philadelphia, Sept. 23, 1926, and successfully defended his title in a second bout with Dempsey in Chicago a year later. On July 26, 1928, in New York City, he knocked out another challenger, Tom Heeney, in the eleventh round. In October of the same year, he announced his retirement from the ring. He was married in Rome in 1928 to Miss Mary Josephine Lauder.

TURBINES, STEAM. See STEAM ENGINES AND STEAM TURBINES.

TURINA, JOAQUÍN (1882-). A Spanish pianist and composer, born in Seville. He received his first instructions in his native city from Rodríguez (piano) and Torres (theory), then was a pupil of Tragó in Madrid, and in 1905 went to Paris, where he finished his pianistic studies under Moszkowski and studied composition under d'Indy at the Schola Cantorum. He remained in the French capital until 1914, when he settled in Madrid as conductor of the Russian Ballet and as pianist of the Quinteto de Madrid. As a teacher, he exerted a wide influence in raising the standard of musical education throughout Spain. He and de Falla are the leaders of the younger Spanish composers who are, in their main characteristics, following the ideals of the French impressionists. Turina's principal works are the operas *Margot* (Madrid, 1914), *Navidad* (1916), *La Adúltera penitente* (Barcelona, 1917), *El Jardín del Oriente* (Madrid, 1923); two symphonic poems, *La Procesión del Rocío* and *Evangelho de Navidad*; *Sinfonía sevillana*; *Danzas fantásticas*, a string quartet; a piano quintet; a piano trio; numerous compositions for piano. He also wrote *Enciclopedia abreviada de Música* (2 vols.).

TURKESTAN, tŏŕ'kĕ-stán', **RUSSIAN** (TURK-MENISTAN). Since the Russian Revolution, an autonomous republic in central Asia federated with the Union of Socialist Soviet Republics. It was governed after Apr. 12, 1921, when Moscow relinquished control, by its own Central Executive Committee and Council of People's Commissaries. On Oct. 27, 1924, the Trans-Caspian Region of Turkestan, the Charjui vilayet of Bokhara, and a part of Khiva on the west bank of the Oxus were organized as the Turkoman Soviet Socialist Republic. In May, 1925, the Turkoman Republic became a constituent republic of the Soviet Union. Former Russian Turkestan comprised the provinces of Ferghana, Samarkand, Semiyetchensk, Syr-Darya, and Transcaspia and had an area of 571,650 square miles and a population of 7,201,551 (1920). The population in 1912 was 6,416,700. The Turkoman Republic has an area of 189,603 square miles and a population of 1,030,549. Ashkabad, population 47,155 in 1929, is the capital. Other large towns are Merv, Charjui, Kerkĭ, Tashauz. The population is 70 per cent Turkoman and 16 per cent Uzbeks. Cotton, wool, Asiatic flax, carpets, ozokerite, oil, sulphates, salt, and sulphur are the main products. There are 955 miles of railway line in the territory. See **RUSSIA**.

TURKESTAN, CHINESE. See **SINKIANG**.

TURKEY, tŭr'kĭ. A republic since Oct. 29, 1923. In 1914 Turkey possessed a total area, excluding Arabia, of about 700,000 square miles. Its population at that time was about 21,274,000. By the Treaty of Lausanne of July 24, 1923, the Turkish boundaries were delimited so as to include only about half of its area of 1914, and less than half of its former population. Turkey's territory was thus made up of Anatolia, the Constantinople district, Thrace east of the Maritza River (in Europe), Kars, Ardahan, and some few islands, especially Imbros and Tenebos. The population, too, was seriously reduced. According to the census of 1927, the total population was 13,649,945. The population of the principal cities follow: Constantinople, 673,029; Smyrna, 153,845; Angora, 74,784; Adana, 72,652; Brussa, 61,450; Konia, 47,286; Ghazi-Aintab, 39,571; Caesarea, 39,541; Adrianople, 34,669.

Agriculture. Turkey is essentially an agricultural country. The principal products are tobacco, cereals, cotton, dried fruits, nuts, olives and olive oil, silk, gums, and opium. Returns for 1927 indicated an improvement over 1926 for most crops. Tobacco production was 91,500,000 pounds, against 84,000,000 pounds in 1926 (1924, 170,000,000 pounds; 1925, 104,500,000). Cotton at 57,360,000 pounds (1926-27) showed a considerable increase (1924-25, 37,478,000 pounds; 1925-26, 50,263,000). The fig and raisin crops of 25,000 and 47,000 metric tons, respectively, were somewhat inferior to 1926 returns, but the filbert output was 15,000 metric tons against 5000 tons in 1926. The wheat crop was below the 4,700,000 metric tons produced in 1926. The 1927 olive-oil yield was estimated at 4,580,000 gallons. Opium production was estimated at 3000 cases (ranging from about 132 to 165 pounds) against 4750 in 1926 and 4500 in 1925. Live stock in 1927 consisted of 5,045,000 cattle, 13,222,000 sheep, 8,668,000 horses, and 955,000 mules and asses. Wool production was about 11,900,000 and the mohair clip, 8,157,000 pounds.

Mining. While no comprehensive geological survey ever has been undertaken in Turkey, it is generally believed that the country possesses vast

mineral wealth. Some of it, such as coal, chrome, emery, lead, copper boracite, meerschaum, salt, marble, mercury, antimony, and gypsum, is already being extracted, with a promise of material development.

Manufacturing. Industries in Turkey are mostly quite primitive. There are a few textile mills, sugar factories, fig-packing establishments, and cotton ginneries. There has been a slow recovery of the leading industries which followed the exodus of the non-Moslem population, who predominated in this field. The progress in the rug industry is indicated by the increase in the export of rugs through the port of Smyrna to 11,782,000 pounds in 1927, as compared with 10,382,000 pounds in 1926 and 8,809,000 pounds in 1925. Sugar factories opened near Smyrna and in Thrace in 1926, produced 5620 tons in 1927. Total manufacturing plants in 1927 numbered 65,245 with 256,855 employees.

Commerce. Imports and exports for 1926 were \$122,574,000 and \$98,096,000, respectively. In 1920 imports were \$155,286,000 and exports \$43,659,000, and in the fiscal year 1913-14, they were \$175,455,000 and \$104,222,000, respectively. The five leading exports in order of value in 1926 were tobacco, fruits and vegetables, wool, cotton, and chemicals, and drugs; the five leading imports in similar order were cotton and manufactures thereof, metals, wool and manufactures thereof, sugar, coffee, tea and spices, and mineral oils. The United States supplied 3.5 per cent of the imports and purchased 13.2 per cent of the exports, France, 13.6 and 12.2, Germany, 13.8 and 12.6, Italy, 15.8 and 27.6; and the United Kingdom, 14.1 and 11.4.

Communications. New Turkey had in operation 2796 miles of railway in 1928, and the Government had 1383 miles of new railway under construction. There are no navigable rivers in Turkey, but the long coast line compensated to some extent for the lack of highways and waterways. The number of post offices in Turkey was estimated at over 2000 in 1929. Turkey's shipping after the World War was in poor condition. It was estimated that Turkey had not more than 110,000 tons of shipping at the beginning of the War. In 1927 the Turkish merchant marine was estimated at 186,986 tons. Most of the Turkish shipping was limited in equipment. Turkey under the National Assembly limited her coastal shipping exclusively to vessels under Turkish registry, with the result that a new impetus was given to the development of a national merchant marine. Ship tonnage at Smyrna was 1,775,000 tons in 1927, at Constantinople 11,321,654.

Finance. Budget estimates for 1928-29 showed receipts at £T207,173,000 and expenditures at £T194,580,000; those for 1929-30 disclosed revenues of £T220,291,300 and expenditures of £T220,297,200. The debt of the Ottoman Empire at the close of the World War was \$548,618,000, of which Turkey is now responsible by virtue of the Treaty of Lausanne, for 70 per cent or \$382,184,000. The total annuity of the debt was \$47,282,000 and the new Turkey's share, \$31,539,000. Turkey is to pay on the principal for the first seven years, beginning June, 1928, £T2,000,000 gold annually. This annual payment is gradually increased for each period of seven years, reaching its maximum, £T3,400,000 gold, beginning June, 1951. A plan to retire the old paper currency went into effect on Nov. 1, 1927. The total new paper currency amounted to £T153,000,000.

Education. Under the Republic, education is nominally compulsory for all children of both sexes. The schools are directly in charge of the Ministry of Education. The policy of the republic has been to abolish religious schools of all kinds and replace them with government schools. The government schools comprise primary grades, secondary schools, training schools for teachers, and the University of Constantinople. No satisfactory educational statistics for the Republic have been published down to 1920. On Nov. 1, 1928, the National Assembly passed a law for the adoption of the Latin alphabet. Publication of books in Arabic characters was forbidden after Jan. 1, 1929.

History. The friendly policy which the German Emperor pursued toward Turkey from the beginning of the twentieth century bore fruit before the World War was many months old. Russia's known designs on the Straits, England's retention of Cyprus, the spread of English influence in Egypt, the Pan-Slavic movement which implied the irrevocable loss of Turkish territory in Europe—all militated against the maintenance of a friendly attitude toward the Allies. Late in October, Turkey's hand was forced when a German-Turkish squadron, headed by the German Admiral von Souchon, bombarded Russian Black Sea ports. On October 31, Russia retaliated by declaring war. The other Allies followed suit. The character of the struggle was immediately and profoundly changed. From being a war localized in Europe, its incidence spread over the Near East and touched India. English troops before long were engaged in Mesopotamia and in defense of the Suez Canal. Here was the origin of the ill-fated expedition to force the Dardanelles and of the prolonged struggle in the Saloniki region. Now, too, there was danger that the entire Moslem populations of Arabia, India, and Egypt might plunge into a Holy war at the behest of the Sultan, who was their Caliph or religious head.

Fortunately for the Allies, however, the dangers of a Holy War failed to materialize, and while India and Egypt remained at least relatively quiet, some of the Arabs, headed by the Grand Sherif of Mecca, actually declared their independence in 1916. This separatist spirit was fomented and abetted by such able British agents as Colonel Lawrence and Gertrude Bell (see ARABIA). From 1916 on, Turkish arms, except on one front, were everywhere unsuccessful.

After an initial setback, the British succeeded in overrunning Mesopotamia; in 1917 Palestine was lost to the Turks, and in 1918, Syria. In Transcaucasia, Turkey emerged triumphant after the collapse of Russia, and by the Brest-Litovsk Treaty received the former Turkish provinces of Kars and Ardahan. Beset by enemies on all sides and confronted by pressing internal problems of which famine and brigandage were only the more evident, on Oct. 12, 1918, the Turkish government appealed to the United States by way of the Spanish Ambassador at Washington for an immediate cessation of hostilities. On October 30, Turkey surrendered to the British Vice Admiral Calthorpe and on the next day accepted the terms of the Armistice of Mudros. Its conditions were drastic: the Dardanelles, Bosphorus, and Black Sea were to be opened to the Allies, the army was to be demobilized, and all Turkish war and merchant ships surrendered; troops were to be withdrawn from Transcaucasia. With its acceptance, the Young Turk movement

collapsed, too, and Enver, Taaalat, and Djemal, with the other members of their party, fled the country.

The Turkish people, however, refused to accept the status of a conquered nation, and in the period following the War, so assiduously played the diplomatic game that, as a result of the Greek defeat and the mutual jealousies of the French and the British, Turkey emerged to a large extent triumphant. In 1919 her rulers were prepared to accept extensive territorial losses as well as the restoration of the Capitulations (which Turkey had terminated on her entrance into the War), and an international control of the Straits; but the unwise decision of the Supreme Council early in 1919, at the prompting no doubt of Venizelos, to deprive Turkey of Thrace as well as Smyrna, aroused patriotic Turks to a fury that became white hot when Greek troops were landed in Smyrna in May, 1919. The last straw was the signing of the Treaty of Sèvres on Aug. 10, 1920, by representatives of the discredited Sultan Mohammed VI, who had succeeded to the throne upon the death of Mohammed V, in July, 1918.

The treaty clearly reflected the selfish interests and rivalries of the Western Powers in the Near East. By it, Turkey was to become a shadow of her former self. Thrace, the islands of Tenedos and Imbros, the Dodecanese, Smyrna (for five years preceding a plebiscite), Cyprus, Egypt, Armenia, Mesopotamia, Syria, Palestine, and the Hedjaz were lopped off. Constantinople was to remain Turkish, but the Dardanelles, the Sea of Marmora, and the Bosphorus were to form a "Zone of the Straits" under international control. An independent Armenia was established and the drawing of its frontiers entrusted to President Wilson, who finally delimited a state of 30,000 square miles with an outlet, Trebizond, on the Black Sea, but the Turkish Nationalists refused to accept the treaty, as, ironically enough, did the governments of all the signatories. Meanwhile, with the consent of the Supreme Council, Greek forces had occupied Eastern Thrace and spread over Smyrna.

Then, much to the astonishment of the Allies, things began to happen in Turkey. The Turkish Nationalist Party, led by Mustapha Kemal Pasha, after signing a National Pact on Sept. 13, 1919, set up a Grand National Assembly at Angora in the heart of Anatolia, and thus far removed from Allied influences at Constantinople. On Jan. 20, 1921, this Assembly voted a new constitution for Turkey in the form of the Fundamental Law. This document vested the sovereignty in the people and in their representatives (elected every four years) at Angora. Universal male suffrage without distinction as to religion or race was provided for, and a programme of social reform projected. Next, the Nationalists refused to recognize the Treaty of Sèvres as binding, and Mustapha Kemal, as President of the Assembly and Commander-in-Chief, set out to clear the country of the foreigners.

Kemal was born in 1880 of a politically powerful family, became an army officer, took part in the Young Turk Revolution of 1908, fought in Tripoli in 1911 and 1912, as well as in the Balkan wars, and was largely responsible for the failure of the Allies at Gallipoli in 1915. He was chagrined when the Sultan signed the Armistice in 1918, and called the Nationalist Congress to meet at Erzerum on the Black Sea. For this, the Sultan, at Allied request, sent an army to subdue him, but Mustapha defeated it with ease and

made arrangements for the meeting of the National Assembly at Angora in 1920. He then embarked upon a career which was so glorious as to win for him the title of Ghazi, meaning Conqueror.

In an understanding with Soviet Russia, effected late in 1920, Mustapha, representing Nationalist Turkey, was promised financial and material aid, as well as supplies of men to facilitate a readier communication with Transcaucasia, a Turkish Army marched into the Armenian Republic of Erivan in September, 1920, and by November had not only humbled it but celebrated its victories by bloodshed. The massacres recalled the days of 1915-16. The result was the establishment of a Soviet state of Armenia, the cession once again of the provinces of Kais and Ardahan to Turkey, and the establishment of communications between Erzerum and Azerbaijan.

Meanwhile, the defeat of Venizelos in the Greek elections of 1920, the return of King Constantine as a result of the plebiscite of Dec. 5, 1920, and the withdrawal of Allied aid to Greece, changed the whole aspect of the situation once again. Dissension in the Allied councils was now too plain. The English support of Greece had been uncertain, the French in a year had made a *volte-face* and were openly favorable to Turkey. The purposes of the two countries conflicted sharply, as a result of their imperialistic ambitions in the Near East. All these factors led to an attempt in February, 1921, to revise the Treaty of Sèvres, at the expense of Greece, and for the grudging reconciliation of the Nationalists. Greece, against the advice of the Supreme Council, refused to compromise and in March, 1921, took into her own hands the enforcement of the Treaty of Sèvres.

As the war between Turks and Greeks dragged on during 1921-22, France took the opportunity to seek her own advantage, at the expense of Allied unity. On Oct. 20, 1921, an agreement was signed with the Angora government by which, for the price of withdrawal from Cilicia, the French gained immunity in Syria, as well as important financial and mining rights and a lease of a part of the Bagdad Railway. Italy likewise concluded a secret agreement with Angora.

In the summer of 1922, the Greek troops, exhausted, poorly led, with a shattered morale as a result of the uncertainties of the home situation, everywhere gave way, murdering and pillaging as they retired, and in September, were compelled to evacuate the city of Smyrna. Before the end of October, the country was free of the invader. (For a discussion of the war, see GREECE.) The alarm of Europe at this turn of events would be difficult to exaggerate. A triumphant Turkey might menace the security of Thrace, Syria, Mesopotamia, Arabia, the well-being of the Christian populations of Asia Minor and the Jews of Palestine, and the peace of mind of the whole Moslem world. Premier Lloyd George strenuously objected to the appearance of a Turkish force in Europe, hastened troops into the Chanak region to oppose a passage into Thrace, and in spite of a studied French and Italian indifference, worked heroically, by a mixture of doggedness and forbearance for the arrangement of a peace. An armistice was signed at Mudania, October 10, which was tantamount to a Turkish triumph, for the Greeks were compelled to evacuate Thrace. The Turks met with the Allies on Nov. 20, 1922, at Lausanne, to draft a definite peace treaty.

The conference sat for 11 weeks, broke down in February, 1923, because of the Turkish rejection of the Allies' proposals, and then resumed sittings on April 23. On July 24, a treaty was signed by Great Britain, France, Italy, Japan, Greece, Rumania, and Turkey which unmistakably revealed the regeneration of the Turkish spirit and the breakdown of Allied unity.

In an atmosphere of intrigue which clearly indicated that Europe had learned nothing from the War, a peace was effected which left Turkey secure in Europe and in control of Constantinople, the Bosphorus, and the Straits. Syria, Palestine, Mesopotamia, the Hedjaz, and Yemen were severed from Turkey, the Dodecanese were given to Italy and not to Greece, while Eastern Thrace to the Maritza line and the whole of Anatolia, including Smyrna, were left in Turkish hands. The Capitulations were abandoned in exchange for promises of judicial reform, and provision was made for a wholesale exchange of Turkish subjects in Greece for Greek subjects in Asia Minor. Conventions for the regulation of the Straits and the demilitarization of the Greek-Bulgarian-Turkish frontier in Eastern Thrace were also signed.

At peace with the world at last, Turkey could now concentrate upon internal reforms. Already on Nov. 3, 1922, Mohammed VI had been forced to abdicate, and the Assembly then elected Abdul Mejid Caliph in his place. Then, on Oct. 20, 1923, Turkey was officially declared a republic with its capital at Angora, and Mustapha its first President. On Mar. 2, 1924, the Assembly went still further and abolished the Turkish Caliphate entirely, at the same time exiling all the members of the House of Osman and depriving them of their Turkish citizenship. The Caliphate, for centuries held by Ottoman sultans, nominally implied spiritual headship over the entire Moslem world, but its real importance was grossly exaggerated by public opinion in the Occident. In reality, the Caliph had long been disregarded not only by the schismatic Shahs of Persia, but by the millions of orthodox Mohammedans in non-Ottoman countries. Nevertheless, after the Angora Assembly's action, rival aspirants to the Caliph's vacant office appeared on every hand—the King of Egypt, the Sultan of Morocco, the Aga Khan of Bombay, and the King of the Hedjaz, but the Caliphate remained an unappropriated honor.

Although the new constitutions of 1923 and 1925 still mentioned Islam as the religion of the state, an amendment to the constitution in 1928 finally declared that Turkey no longer had a state religion. In other words, Mohammedanism was tolerated in the same way that any other religion was tolerated, and Mohammedan mosques no longer received state support.

In the matter of political, economic, and social reform, two slogans influenced the Government's activities: "Turkey for the Turks" and "Efficient Turks for Turkey." The first ideal was carried out by the deportation of the Greeks, and by the passing of laws prohibiting members of foreign nationalities from settling in Turkey. Turkish labor, Turkish capital, Turkish ownership, and products, were to prevail. The second ideal was carried out by a process of Europeanization—startling, quick, and dictatorial. Although he was regularly reelected for a further four-year term on Nov. 1, 1927, under the provisions of the new constitution of October, 1925, Kemal did not try to hide the fact that he was virtually Dictator of Turkey; but the Turks were accustomed

to arbitrary rule, and Mustapha was popular, so that he had relatively little opposition. In 1925 polygamy was abolished and the wearing of the veil on the part of women made optional. New divorce laws were promulgated and various professions and public offices thrown open to women. In the summer of 1929, they were given the right to vote in municipal elections.

In 1926 the old Mohammedan law codes were abolished and replaced by adapted forms of the Swiss civil code, the Italian criminal code, and the German commercial code. The Gregorian calendar also was adopted in 1926, and civil marriages made obligatory, though religious ceremonies might follow if desired. The number of primary schools in 1928 was twice the number in 1914, and in May, 1928, a law was passed providing for the gradual introduction of the Western alphabet and numerals over a period of from five to fifteen years. A new official dictionary containing only words of Turkish origin (about 24,000 in number) was published in 1929. The wearing of the fez, or turban, was prohibited. Many economic reforms were introduced, and deserving families were given state aid in setting themselves up on Anatolian farms. Mustapha, like Mussolini, had his own model farm. Special government departments were created to study agriculture, commerce, and shipping. Commercial treaties were negotiated with most European countries, but every project to speed reconstruction by the aid of foreign money was discouraged. A new tariff law went into effect Oct. 1, 1929. New railways and telegraph and telephone systems were built as rapidly as finances permitted, and before long Turkey also had its share of motion-picture houses and jazz palaces.

In foreign policies, Turkey continued to be suspicious of the League of Nations, especially after 1925, when the League decided against it in a dispute with England over northern Iraq. This made it draw closer to Russia with which country a treaty of friendship and arbitration was signed in 1923 and strengthened and renewed in 1925 and 1928, when a similar treaty was signed with Italy, which fact caused considerable fright in France. There were rumors late in 1928 of a proposed Afro-Asiatic alliance between Persia, Afghanistan, Egypt, and Turkey, but the latter country's gaze was centred so strongly on the West, that there seemed little ground for believing in the possibility of an entangling alliance with the more decidedly Oriental countries. Although the United States Senate definitely rejected the Lausanne Treaty on Jan. 18, 1927, a *modus vivendi* had to be found since economic interests were again beginning to outweigh diplomatic considerations. Accordingly, by an agreement of Feb. 17, 1927, provision was made for a renewal of diplomatic and consular relations, and on May 20, 1927, Joseph C. Grew was appointed American Ambassador to Turkey. The *modus vivendi* was to last until June 1, 1928, with possibilities for renewal. On June 1, 1928, then, it was renewed for another year, and on June 1, 1929, it was again extended to run until June 1, 1930. For the dispute regarding Mosul, see IRAQ. TURNER, WALTER JAMES REDFERN (1889-). An Australian poet and musical critic who was educated at the Scotch College in Mel-

bourne, traveled, and then settled in England where he became musical critic on the *New Statesman* (1916-), and was also dramatic critic for the London *Mercury* (1919-23), and literary editor of the *Daily Herald* (1920-23). His poetry tends toward the romantic, and has an unusual detachment from the events of daily life. He wrote two plays, *The Man Who Ate the Popomack* (1922) and *Smaragda's Lover* (1924). Besides many articles for magazines, his writings, largely poetry, include *The Hunter and Other Poems* (1916), *The Dark Fire* (1918); *In Time Like Glass* (1921), *Music and Life*, essays (1921), *Landscape of Cythera* (1923); *Variations on the Theme of Music*, essays (1924); *Orpheus, or the Music of the Future* (1926); *Margold, an Idyll of the Sea* (1926); *Beethoven* (1927); *The Aesthetics* (1927); and *Musical Meanderings* (1928).

TURNER, WILLIAM (1871-). An American Roman Catholic bishop, born at Kilmallock in Ireland. He was graduated from the Royal University of Ireland in 1888, and studied at the American College at Rome and in Paris. In 1893 he was ordained priest and from 1894 to 1906 was professor of philosophy at St. Paul Seminary. From the latter date to 1919, he occupied the same chair at the Catholic University of America. In 1919 he was consecrated Bishop of Buffalo. Bishop Turner is the author of *History of Philosophy* (1903), and *Lessons in Logic* (1911). He edited *The American Ecclesiastical Review* from 1914 to 1919, and was associate editor of *The Catholic Historical Review*.

TURPAIN, ALBERT CAMILLE LÉOPOLD (1867-). A French physicist, born at La Rochelle, and educated there at the École Fénelon. He became professor of physics at the University of Poitiers and was one of the first to perform experiments in wireless telegraphy. His works include *Recherches expérimentales sur les oscillations électriques* (1899); *La Télégraphie sans fil et les applications pratiques des ondes électriques* (2d ed, 1908); *Leçons de physique* (2 vols, 6th ed, 1920), *Manipulations de physique* (1908); *Téléphone* (1909); *Télégraphie* (1910), *La Lumière* (1913), *L'autre ennemi, Son invasion, ses progrès, ses méfaits, sa carte de guerre* (1917), *Vers la Houille Blanche* (1918), *Manipulations électro-techniques* (1920); and *Conférences scientifiques*, his collected essays (5 vols., 1924).

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. A nonsectarian, coeducational normal and industrial school for the education of Negro youth, at Tuskegee, Ala., founded by Booker T. Washington in 1881. The student enrollment rose from 1527 in 1914 to 3323 in 1928. In the same period, the faculty increased from 192 to 274 members, the library from 20,000 to 40,000 volumes, productive funds from \$1,942,112 to \$7,308,397.36; and yearly income from \$473,764 to \$485,206. A group of boys' trades buildings was constructed in 1919 at a cost of \$226,000, and the Ellen Curtiss James Hall, a dormitory for girls, in 1920. Junior college courses of three years in agriculture and two years in teacher training and business practice were added to the regular academic course. The Institute received an anonymous gift of \$250,000 for permanent improvements in 1916 and \$800,000 from the will of Mrs. Russell Sage in 1919. President, Robert Russa Moton, LL.D.

TUTANKHAMEN. It would probably be difficult to discover an Egyptian King of whom

less is known historically and who at the same time is better known to the civilized world. The fame is of course due to the discovery of his tomb and its indescribably sumptuous contents by Lord Carnarvon (died 1923) and Howard Carter in 1922. Finds of amazing richness and beauty have continued to be made up to the present time. Not the least interesting discovery late in 1928 was that iron was still looked upon as a precious metal in Tutankhamen's time. The fourth and last chamber of the King's tomb was cleared in 1928. This Pharaoh, whose funerary furnishings are the most splendid yet discovered, belongs chronologically to the end of the eighteenth dynasty. He was the husband of the third daughter of Akhenaten, or Amenhotep, the famous heretic King, and came to the throne a short time before or after the death of his father-in-law—probably after it. We do not know whether he was of royal blood. It is believed that he died when he was hardly more than a boy. At the time of his marriage, his wife, Ankhes-en-pa-Aten, could hardly have been over ten years old. Just how long Tutankhamen ruled also is unknown, though certainly it was at least for six years.

It is common knowledge that Akhenaten, the dreamer, by his substitution of a monotheistic religion, had alienated the priestly caste, who found themselves well in the way of losing power. It is equally well known that in all probability the idealism of the King was incomprehensible to the uneducated, who must have longed for a return to the traditional form of worship of the country. During the reign of Akhenaten, too, the foreign policies of Egypt lacked vigor and the Empire abroad was crumbling. It is small wonder that soon after his death there should have been a violent reaction toward the traditionally accepted forms of religion. How soon this took place may be estimated from the fact that on the back of one of the chairs found in the tomb of Tutankhamen appears the symbol of the god Aten, while elsewhere in the same room the name of the youthful ruler is spelled with the ending "amon," showing that the maintenance of his position upon the kingly throne probably required him to return to an allegiance to the older form of worship. In view of his youth, it is a matter of speculation how he came to occupy the throne at all. He seems to have been too young to count for much on his own part. Perhaps the answer is to be found in the fact that his successor, Aye, who during Tutankhamen's reign was chief priest, represented himself on the wall of the burial chamber of the young King's tomb. Since it is most unusual for any other than the deceased King himself to appear in decorations of his tomb, the suspicion arises that this priest chose to have the young Tutankhamen on the throne as a matter of policy, for the boy would be likely to prove pliable in the hands of this powerful friend of the family, who felt perhaps that the time was not ripe for him to seize the throne for himself. For description of his tomb see **ARCHAEOLOGY**.

TYDINGS, MILLARD E. (1890–). A United States Senator. He was born at Havre de Grace, Md., and graduated at Maryland Agricultural College in mechanical engineering. He studied law at the University of Maryland and was admitted to the bar in 1913, beginning prac-

tice at Havre de Grace. In the World War, he was with the A.E.F. in France as lieutenant colonel in the 29th Division, Machine Gun Units, winning the Distinguished Service Medal. He was a member of the Maryland House of Delegates for two terms, becoming Speaker in 1920–22. Later, he was sent to the Maryland Senate and during 1923–27 represented the 2d District in the Sixty-eighth and Sixty-ninth Congresses. In 1926 he was elected as a Democrat to the U. S. Senate for the term ending in 1933. He has been a member of the Senate committees on District of Columbia, inter-state commerce, naval affairs, public buildings and grounds, and territories and insular possessions.

TYNAN, KATHARINE. See **HINKSON, MRS. KATHARINE**.

TYPHOID FEVER. During the World War, typhoid in the ordinary course of events would have been a tremendous menace to the troops, but the successful use of mass preventive measures, as carried out in the mobilization of 15,000 United States troops along the Rio Grande when hostilities with Mexico threatened, had shown what can be done in war time. The warring troops were as rapidly as possible immunized against typhoid, the two paratyphoid fevers, and dysentery; usually, three serial inoculations were practiced. In addition, the older sanitary measures, such as proper construction of latrines and disposal of feces, anti-fly campaigns, etc., were practiced. As a result, the troops were remarkably free from these infections throughout the War, although it was found that protective inoculation of troops after prolonged exposure to hardships could not always be guaranteed.

In civil practice, it was shown again and again that combined prophylaxis against typhoid in cities can stamp out the disease even in communities as large as Chicago. The water supply must be pure, and city dwellers about to go on summer vacations and to drink from doubtful wells are urged to subject themselves to preventive inoculation. Campaigns against house and stable flies are encouraged by health authorities. It is often found that the greatest obstacle encountered in eradicating the disease entirely is the so-called "typhoid carrier" who still harbors the virus about his, or more often her, person, and who is able to contaminate the food supply of houses and institutions. The worst carriers are cooks and others who come in contact with the food.

The great epidemic at Montreal in 1927 has been styled one of the most deplorable in modern times. Over 5000 were stricken and there were 545 deaths. The epidemic originated from an insanitary milk supply from a focus in Quebec and in the earlier weeks, the local health authorities were accused of an almost medieval indifference to the peril of the community, for they did practically nothing in the way of tracing the source of infection. Pasteurization of the milk supply alone should have averted most of the danger.

At about the same time, Mussolini was ordering a vigorous campaign of compulsory anti-typhoid vaccination for Italy, restricted, however, to the groups most disposed to contract or diffuse the disease, save when an epidemic threatened, when the practice became compulsory for all exposed. Owing to certain objections to anti-typhoid vaccination in some industrial localities, the method of peroral immunization has been tested and favorable reports have been received,

for example, from the Yugoslavian city of Osijek. Swimming-pool and bathing-beach sanitation against the spread of typhoid has become more active, since it has been found that there is no possibility of keeping certain shore waters free from sewage pollution.

TYPHUS FEVER. During the World War, knowledge of this affliction was notably augmented. Much also was learned from a study of Mexican typhus, which occasionally crosses into the United States; during 1923 there was a small epidemic in southern California. The part played by the louse as the sole medium of transmission became fully realized, and prevention of its spread was effected chiefly by delousing and by the use of approximately louse-proof apparel by those necessarily exposed. A few cases appeared in western Europe during the War, but gave no trouble, and it was shown in the intensive anti-typhus campaign that there were a few cases in Paris which may not have been imported, recalling the so-called Brill's disease sometimes encountered in New York. It was realized that the true virulent disease might run a mild course and that the malignancy of epidemics is due to rapid passage through its victims, facilitated by overcrowding and the low resistance of the patients, who are often in a state of semi-starvation. During the War, the countries ravaged by typhus were Russia, the Balkans, Poland, and Galicia, and the disease extended eastward into Asia. Its invasion of the rest of Europe was held in check only by the most intensive efforts, only a few hundred cases occurred in mid-Europe. The cause has never been determined, although many organisms have been accused and serological studies have been of use in diagnosis. No specific remedy has been discovered.

TYROL, TIRÖL. A province of the Republic of Austria. Its area in 1910 was 10,301.7 square miles, in 1923, 4882 square miles. Its population in 1910 was 946,613, in 1923, 313,885. See **AUSTRIAN REPUBLIC, TYROL, GERMAN SOUTH.**

TYROL, GERMAN SOUTH. On the possession of this area, made up of the districts of Trentino (area, 2454 square miles) and Alto Adige (area, 2953 square miles) centred a bitter struggle between Austria and Italy, and though Italy emerged victorious in 1919 by gaining the region through the Treaty of St. Germain, subsequent events revealed that it still remained a source of grave conflict. Racial figures reveal the situation. The Trentino, in 1910, contained, 13,450 Germans and 360,847 Italians, Alto Adige had 215,796 Germans, 6704 Italians, and 19,605 Ladins (who speak a dialect akin to Italian). Italy's claims, therefore, for frontier rectification north of the Trentino could be based only on strategical grounds. Austrian control of the Alpine passes meant that the plains of Lombardy and Venetia lay always open to a hostile attack, and the easy success with which the Austrian armies had poured into Italy in 1916 gave point to the contention. This consideration had been behind one of the guiding principles of the Italian foreign policy. In the early months of the World War, when both sides were exciting all their efforts to gain either Italian adhesion (Allies) or to assure Italian neutrality (Central Powers), Baron Burian for Austria made two Austrian offers. The second of these offered to cede the Trentino, but halted at the transfer of Bozen. On May 3, stating that an agreement was impossible, Sonnino declared for Italy that the treaty of alliance with Austria was terminated and that henceforth Italy re-

served to herself "complete liberty of action." It is interesting to note that a week preceding, on Apr. 26, 1915, Italy had signed with the Allies the secret Treaty of London, by which, for her actual support in the War, she was assured not only the Trentino and Bozen but the whole German South Tyrol to the Brenner Pass, including the old German towns of Bozen, Brixen, and Meran and the wholly German-populated valleys of the Oltzthal and the Zillertal. On this treaty, Italy plainly took her stand at the Peace Conference. Regardless of the fact that there were 230,000 Germans in the territory, that the Ladins in October, 1918, had expressed their sympathies as being with the German Tyrolese, and that the whole Tyrol was a political and economic unit, the Peace Conference finally yielded to the Italian demands and incorporated, substantially, the London line into the Treaty of St. Germain (on May 29, 1919).

There was widespread disaffection on the part of the smaller powers because Italy, unlike themselves, was not compelled to sign a Minorities Treaty. It was plain that for an Italia Irredenta an Austria Irredenta had been substituted. The events of 1919-20 only served to confirm this fact. On Jan. 20, 1919, the Austrian Tyrolese Diet passed a resolution refusing to recognize the cession of South Tyrol. In April, 1921, the Austrian Tyrolese, realizing that the weakness of their own country might stand in the way of an eventual readjustment, voted for union with Germany. On the other hand, Italy, perversely it seemed, did everything to fan the flame of Tyrolese discontent. From April, 1922, on, with the advent of Fascism, the population was subjected to a series of outrages, which, under the Mussolini régime, turned into legal oppression. Italianization of the inhabitants proceeded rapidly. Italian place names were substituted for the universally known German, Italian was prescribed as the official language of public bodies and the courts; Italian officials began to be introduced in completely German-speaking parishes and Austrian railway and postal employees were dropped for Italians, all instruction in elementary schools was being changed to Italian while religious instruction was undergoing the same change (beginning October, 1923).

In 1924 Italians began to confiscate the property of the German citizens residing in the South Tyrol, in direct violation of the Treaty of St. Germain. In 1925 complaints in the German and Austrian press of the "ruthless" measures employed in the Italianization of the Tyrol were answered by a defiant speech from Premier Mussolini before the Italian Chamber. Foreign Minister Stresemann replied in a moderate but firm tone before the Reichstag, provoking a vigorous counter-reply from Mussolini before the Italian Senate. Austria, Bavaria, and Germany again protested in 1926 and 1928 against Italy's treatment of the German population of South Tyrol, but the effort to impose Italian culture continued. In 1929 the territory remained a fertile source of enmity between Italy and German-speaking peoples. See **ITALY, under History.**

TYRRELL, THE RT. HON. WILLIAM GEORGE, FIRST BARON (1866-). A British diplomat. He was educated at Balliol College, Oxford, and entered the Foreign Office in 1889. From 1907 to 1915, he was Senior Clerk, acting as private secretary to Sir Edward Grey. He was Assistant Under-Secretary from 1919 to 1925 and Permanent Under-Secretary from 1925 to 1928, when he

was appointed British Ambassador to France. He received the Coronation Medal in 1902 and 1911, and was created Knight Commander of the Bath in 1927, Privy Councilor in 1928, and baron in 1929.

TYERWHITT, 1st Lt, SIR REGINALD YORKE (1870-). A British admiral, born at Oxford. He joined the navy in 1883 and was promoted through the grades till he reached the rank of rear admiral in 1919. The same year he was created a baronet. He had an important part in the World War as commander of the destroyer flotillas in action in Heligoland Bight in August and December, 1914, and off Dogger Bank in 1915, receiving the D.S.O. in the next year. He was the commanding officer of the coast of Scotland (1923-25), was made Vice Admiral in 1925, and Commander-in-chief of the China Station (1927-29).

TYSON, LAWRENCE DAVIS (1861-1929). A United States Senator, who was born near Green-

ville, N. C., and graduated at the U. S. Military Academy (1883). He served in the Army for twelve years, including five years as professor of military science and tactics at the University of Tennessee. He resigned his commission in 1895 to practice law at Knoxville, Tenn., but volunteered for the Spanish-American War in 1898 and as colonel took the Sixth Regiment of Volunteer Infantry to Porto Rico for service. In the World War, he was commissioned a brigadier general and assigned to the command of the 59th Brigade, 30th Division. For exceptionally meritorious service, he was awarded the Distinguished Service Medal. In 1903 he had been elected to the Tennessee Legislature and made speaker of the House. He continued active in politics, being a delegate to the Democratic National Convention of 1908. He was elected United States Senator in November, 1925, for the term ending in 1931. He died two years before the expiration of his term.

U

U-BOAT WARFARE. See GERMANY; SUBMARINES, VESSEL, NAVAL.

UCHIDA, COUNT YASUYA (1865-). A Japanese diplomat and public official, who was born in Kumamoto-ken and graduated in law from the Imperial Tokyo University. He served successively as attaché at Washington, personal secretary to the Minister of Agriculture and Commerce, legation secretary at London and Peking, director of the Political Bureau, Vice Minister of Foreign Affairs (1900-01), and Minister to Peking (1901-06). Appointed Ambassador to Vienna in 1906 and to Washington in 1909, he became Minister of Foreign Affairs in 1912 and held the same portfolio in the Hara and Admiral Kato cabinets. During the World War, he was Ambassador to Petrograd (Leningrad). In 1924 he was made a Privy Councilor, a post which he resigned in July, 1929, after he had been criticized in connection with the wording of the Briand-Kellogg Pact, which he had signed on behalf of Japan at the Paris ceremony earlier that year.

UDRŽAL, FRANTIŠEK (1866-) A Czechoslovak public official. He was a member of the Bohemian Diet until its dissolution in 1913 and of the Austrian Reichsrat (1897-1918), being vice president in the latter year. Following the proclamation of the Czechoslovak Republic (1918), he was a member of the Constitutional Assembly. A member of Parliament representing the Agrarian Party (after 1920), he served as Minister of National Defence (1921-25 and 1926-29).

UFER, WALTER (1876-). An American painter who was born in Louisville, Ky., and studied chiefly at the Royal Academy of Dresden and then in Chicago and at Munich. He settled at Taos, N. M., and became known after 1914 as one of the foremost painters of the Pueblo Indians. He paints their life and country with deep and sympathetic insight into the Indian character in vivid color, and with fine decorative feeling. He received the First Logan Medal of the Art Institute of Chicago (1917); the Altman Prize, National Academy of Design, New York (1921); the Temple Gold Medal, Pennsylvania Academy, Philadelphia (1923); the first prize for Kentucky artists, Nashville, Tenn. (1925), and the second Altman Prize and Isidor Medal from the National Academy (1926). He is represented in the Public Museums of Brooklyn, Chicago, and Philadelphia, the Corcoran Gallery, Washington, D. C., and in other museums. He became a member of the National Academy of Design in 1926.

UGANDA, ōō-gān'da or ū-gān'da. A British protectorate in East Africa with an area of 94,204 square miles, and an estimated population (December, 1927) of 3,157,008. Of these, natives numbered 3,143,670; Asiatics, 11,464; Europeans, 1874. There were 3651 Asiatics in 1914 and 1017 Europeans. Chief towns are Mengo, in Kampala (population 40,000); Entebbe, the capital

(population 12,000). Cotton growing continues the most important single activity. In 1913-14 the cotton export was valued at £317,687; in 1921, at £1,281,000, in 1926, at £3,051,791; and in 1928, at £2,486,000. Next in order were (exports of 1927). Coffee, £170,407; cottonseed, £170,303, rubber, 182,007; ivory, £34,574, hides and skins, £99,541. The total exports in 1927 were £2,310,260, as compared with £524,200 in 1913-14. Total imports in 1927, £1,819,161, consisting mainly of cotton fabrics and manufactures, £520,514. In 1926 imports totaled £2,114,044.

Revenues for 1913-14 were £256,559 and expenditures £290,180, for 1927 these were £1,292,306 and £1,430,976. The poll tax accounted for the greater part of the revenues in the post-war years; £526,605 in 1927. The debt was £1,107,595 in 1927. After 1914 a cessation was made of imperial grants-in-aid. British penetration into the interior continued, so that by 1915 almost the whole protectorate was, with the exception of Rudolf Province, well in hand. During the World War, great numbers of natives (estimated at 150,000) saw service as carriers in the African campaigns. In 1921, the Legislative Council, made up of nominated members, met for the first time. The Indians refused to participate because of the social and economic segregation to which they were subjected. Various mission schools were attended by 115,5525 boys and 100,876 girls in 1927.

UHAGÓN Y GUARDAMINO, FRANCISCO RAFAEL DE, MARQUES DE LAURENCÍN (1858-1927). A Spanish jurist and historian. Born in Balbao, he studied law in Madrid, winning the doctorate in jurisprudence in 1877, with high honors. Soon, however, he turned from law to letters, history, and scholarship. Probably his greatest service to national culture was that of saving and gathering together, in the Archivo Histórico Nacional, the priceless treasure contained in the archives of the four great military-religious orders of Santiago, Calatrava, Alcántara, and Montesa, and making them accessible to scholars. This he did while serving as Minister of the Tribunal de las Órdenes. He prepared also well-ordered indices of these four orders.

In 1898 he was elected member of the Real Academia de la Historia de Madrid, of which he became director (the twenty-fifth) in 1918, which post he held up to his death. For his services to scholarship and culture, he received numerous Spanish and European decorations. His publications were of varied interests: hunting, riding, falconing, bullfighting, literature, and history. His most important works were: *Índice de los documentos de la orden militar de Calatrava* (1899); *Índice de pruebas de los caballeros . . . de Santiago*, etc. (with Vignau, 1901); *Índice de pruebas de los caballeros . . . de Calatrava, Alcántara, y Montesa*, etc. (with Vignau, 1903); and *Don Agustín de Montiano y Luyando, primer Director de la Real Academia de la Historia* (1926).

UKRAINE. While the Ukrainians had some claim to self-determination on the grounds of language, it is doubtful whether socially and culturally they formed a distinct and homogeneous nation. Before the World War, there were some 35,000,000 of them in central-eastern Europe. In Russia, 30,000,000 were to be found; 3,500,000 in Austria, in Galicia and Bukovina chiefly, and known more commonly as Ruthenians; and 500,000 in Hungary. In Hungary, their national consciousness had been kept alive by the repressive policy of the Magyars, in eastern Galicia, because of their hatred of the Poles, they clung to their language, religion, and folkways (see GALICIA, POLAND.) In Russia, with the beginning of the twentieth century, there began to appear evidences of a tenderly fostered and not very virile Ukrainian movement that aimed at regional autonomy. Though most of the Ruthenians in Galicia were peasants and 60 per cent were illiterate, Lemberg became the cultural seat of the agitation and from it radiated thin lines of influence into the Russian provinces.

The break-up of the Russian empire gave the Ukrainians their long-sought opportunity. The independence of Russian Ukraine was proclaimed on Nov. 21, 1917, that of Austrian Ukraine, on Nov. 19, 1918, on Dec. 14, 1918, the Government of Ukraine, a directory of five members, was set up as a provisional government, and on Jan. 3, 1919, the union of Eastern (Russian) and Western (Austrian) Ukraine took place. Though the Ukrainians had been recognized as constituting a nation by Russia and the Central Powers in the Brest-Litovsk treaties (March, 1918), they were pointedly refused a hearing by the Paris Peace Conference. In fact, they were compelled to see their hopes vanish as the commissioners apportioned out territories they claimed as peculiarly their own. To Rumania, Czechoslovakia, and Poland went Bessarabia, the Carpathian Ruthenians, Bukovina, and Galicia. The region itself was never for long under a single rule nor did it, until 1922, enjoy any surcease from the trials of war. In 1919 the central government, under Hetman Petlura, was waging war against the Poles. In 1920 the Ukraine joined arms with Poland against Russia with the result that its representatives were signatory to the Treaty of Riga (October, 1920), by which the region's independence was recognized by both powers. However, by the treaty, the Polish boundary was pushed so far east that Galicia and Volhynia were lost to the Ukraine. Petlura's government continued to exist for a time, but gradually power was being accumulated in the hands of the Communists, who formed the Ukrainian Soviet Socialist Republic Dec. 11, 1919. From 1919 on, armed bandits terrorized the countryside. The Jews in particular were singled out as victims. Not until 1922 was it evident that the country was settling down to a peaceable activity.

On Dec. 30, 1922, delegates from the Ukraine in company with those of Russia, White Russia, and the Transcaucasian Federation completed a treaty by which the Union of Socialist Soviet Republics was set up. From thence on, the history of the Ukraine was, more properly, that of Russia. Economically, there was every justification for the federation; for, while the Ukraine possesses great wheat, barley, and sugar fields, as well as valuable coal and iron deposits, it is, like the other Russian regions, dependent upon the oil from Baku, the lumber of the northern forests, Siberia's dairy products, and the cotton

UNAMUNO Y JUGO, MIGUEL DE (1864-). A Spanish mystical philosopher. Born at Bilbao, he studied philosophy and letters at Madrid (1880-84). He taught privately at Bilbao 1884-91. In this latter year, he won the chair in Greek language and literature at the University of Salamanca. In 1901 he became rector, and professor of Spanish literature. In 1914 he was dismissed from the rectorship. During the years 1914-18, he defended valorously the Allied cause. In 1924 he was deported for his political activities. By the loftiness of his purpose, and the seriousness and loyalty of his life work, he surpasses all other writers in Spain in the first quarter of the twentieth century. He is a member, and a medalist of arts and letters, of the Hispanic Society of America. His many works include *En torno al casticismo* (1902); *Vida de Don Quixote y Sancho* (1905); *Mi religión y otros ensayos* (1910), *Contra esto y aquello* (1912); *Del sentimiento trágico de la vida* (1913), *Niebla* (1914), *Ensayos* (6 vols., 1916-18), *El Cristo de Valázquez* (poems, 1920); and *Como se hace una novela* (1925).

UNDERWOOD, OSCAR WILDER (1862-1929). An American legislator (see VOL XXII). He was first elected to the Senate in 1915, after serving 20 years in the House of Representatives, and continued in this office until 1927. He was Democratic leader of the Senate in the Sixty-seventh and Sixty-eighth Congresses, resigning in 1923. He served as American delegate to the Conference for the Limitation of Arms in 1921-22. In 1924 he was a candidate for the presidential nomination. He was appointed a member of the International Commission between the United States and France (1927). He wrote *Drifting Sands of Party Politics* (1928), a survey of American political history beginning with the present century.

UNDERWOOD TARIFF BILL. See TARIFF IN THE UNITED STATES, UNITED STATES, under *History*

UNDSET, SIGRID (1882-). A Norwegian novelist, awarded the Nobel Prize for Literature in 1928. She was born at Kallunborg, Denmark, studied at a business college, and was a municipal clerk in Christiania until 1909. In 1907 her first novel, *Fru Marta Oulic*, appeared. It was followed by a series dealing with the rather drab life of the working girl, the most notable of which was *Jenny* (1911). She had long been a student of Norwegian history, and she vividly and authentically reproduced the life and customs of Norway in the fourteenth century in *Kristin Lavrandsdatter* (3 vols., 1920-22), and the thirteenth century in *Olav Audunsson in Hestviken* (2 vols., 1925); *Olav Audunsson and his Children* (2 vols., 1927); and *In The Wilderness*, English translation of the third volume of *The Master of Hestviken* (1929).

UNDULANT FEVER. See VETERINARY MEDICINE.

UNEMPLOYMENT. The period following 1914 saw severe unemployment crises, especially

in the years following the World War. In the belligerent European countries, unfavorable conditions of employment gave way during the War to less than normal unemployment, because of the drafting of many millions of workers into the armies, the stimulation of many lines of production by military needs, and the establishment of central control in industry. Neutral countries which were in a position to cater to the military needs of the belligerents enjoyed a rather lasting war prosperity. The most severe crises of unemployment occurred in the years after the Armistice when the war prosperity came to an end and the after-effects of the War threw the industrial machinery of the world into violent disorders. In the United States, in Great Britain, Germany, Italy, Poland, and Austria, the year 1929 saw great armies of unemployment. The two outstanding reasons were the increasing mechanization of industry and the greater premium on speed, which militated against the employment of middle-aged workers.

United States. Chiefly as a result of the War, the United States experienced its most severe unemployment crisis in many years in 1914 and the early part of 1915. The unemployed constituted 15.8 per cent in 1914, and 16 per cent in 1915, of the total labor force. The very sharp upward turn in business, however, during the summer and the early fall of 1915 had a very wholesome effect on the labor market, and employment conditions improved rapidly, chiefly because of the enormous manufacture of munitions. This improvement continued during 1916 and 1917, when the proportion of the unemployed to the total labor force was 7.1 per cent and 4.7 per cent, respectively. In 1917 there was great scarcity of labor and subsequently a great demand for it. This was due to both the drafting of millions of men into the military service and the great increase in industrial activity. This situation remained unchanged until the late fall of 1918, when some of the employers began to lay off their workmen, although there was still a great deal of demand for manufactured products and the labor market continued to be good until the early fall of 1920. Statistics show that in September, 1920, there occurred in many important industries decreases of from 4 to 14 per cent in the employment. Unemployment gained momentum in the last months of the year and reached its maximum intensity in January and February, 1921. The outstanding event of this latter year in the unemployment situation was President Harding's National Unemployment Conference in October, which set unemployment before the country in an official way as being chiefly a problem of industry. The conference estimated the number of unemployed at from 3,500,000 to 5,000,000. Secretary of Labor James J. Davis estimated the unemployed in the beginning of 1922 at between 5,000,000 and 6,000,000, but this figure is probably an exaggeration. During the course of 1922, the situation improved materially. In 1923 unemployment declined still further and production became normal.

The situation once more became acute during the winter of 1927-28, when the unemployed were variously estimated to total from 1,874,054 to 4,000,000 workers. The country was in an unfortunate position to cope with the problem, for no agencies existed for the tabulation of unemployment figures. The best the Bureau of Labor Statistics could do was to guess what the shrinkage in employment was between 1928 and 1925

(in which earlier year a census had been taken). In other words, there were 25,222,742 workers employed in 1925 and if the shrinkage in certain industries was applied to all the workers, it was calculated that there was a net loss of 1,874,054. W. I. King, in a report submitted to the Unemployment Conference, which was published in *Recent Economic Changes* (1929), estimated the minimum total of unemployed persons in the country as follows: 1920, 1,401,000; 1921, 4,270,000; 1922, 3,441,000; 1923, 1,532,000; 1924, 2,315,000; 1925, 1,775,000; 1926, 1,669,000; 1927, 2,055,000. During 1928 and 1929, the general discussion of unemployment brought to a head the outlining of a programme which economists and social statisticians recognized as a minimal requirement for an adequate unemployment policy. This included the following: the creation of Federal, State, and municipal exchanges; the collection of unemployment statistics through these agencies, one form or another of unemployment insurance; long-range planning of public works by public authorities.

This last plan, which received much public attention in 1928 and 1929, was made the subject of a congressional bill and received the approval of President Hoover. The so-called Jones Bill, introduced in 1928 and 1929 called for the creation of a "prosperity reserve" of \$150,400,000 for public works to be used only when the volume of construction work had fallen off 10 per cent for three months, as compared with a similar period in the preceding three years. The Hoover programme, which was attributed to William T. Foster and Waddill Catchings of the Pollak Foundation, and which was laid before the Conference of Governors in November, 1928, proposed that there be created a \$3,000,000,000 State and Federal construction reserve fund "to do for labor and industry what the Federal Reserve has done for finance."

General approval was given to the scheme by a Senate Committee which reported in February, 1929, and which among other things recommended the following programme: 1 Public insurance schemes, when and if considered, belonged in the province of State action. 2 It was the duty of the States and municipalities to build up efficient employment exchanges. 3 A system for the collection of adequate unemployment statistics was necessary. 4 The Government should adopt legislation for the purpose of providing a system of planning public works to furnish a reserve against unemployment. 5 More consideration needed to be given to the necessity for creating systems of old-age pensions. As a result of congressional enactment in 1929, it was provided that the 1930 census should take the first count of unemployment which was ever made in the country.

Some trade unions sought to cope with the problem by building up unemployment funds in their industries. The plan was first tried by the Amalgamated Clothing Workers which, in Chicago (1923), Rochester (1928), and New York (1928), provided for unemployment benefits through funds built up by employer and employee contributions. Similar funds were devised by the Cloth Cap and Hat Makers Union of New York (1924) and the Ladies' Garment Workers of Cleveland (1921). Benefits, however, were small and for a limited period. Funds have collapsed when the drain of prolonged unemployment has been too heavy. These apparently have been only slight expedients in coping with unemployment.

Great Britain. From the outbreak of the War until 1917, unemployment declined steadily in Great Britain. In the first seven months of the latter year, the percentage of unemployment among trade unions paying unemployment benefits averaged less than one-third of 1 per cent, as compared with an average of nearly 4 per cent during the preceding 10 years. After August, 1917, the number of unemployed increased and in 1919 the situation became serious, due to the rapid demobilization. Following upon this unfavorable condition of the labor market, there came an interval of about eight months during which the rate of unemployment was low; but in the autumn of 1920, the most acute crisis, that of unprecedented unemployment, began. In June, 1921, the number of men out of work, entered on the insurance list, was 2,177,000, and the number partially unemployed was 998,000.

In fact, in January, 1921, 23.1 per cent of the British workers was unemployed. By June, 1920, the proportion was 14.6 per cent, and in January, 1929, 12.3 per cent of the country's 11,880,000 workers was without work. The following industries were affected: mining, textiles, constructional engineering, miscellaneous metals, leathers, and distributive trades. The Government sought in various ways to cope with the problem which was largely due to mechanical changes in industries and American competition in the markets of the world. The period saw great extensions in the unemployment insurance system.

In 1911 Great Britain had introduced an act for the protection of 2,250,000 workers against unemployment. The benefits of the act were extended in 1916 and again in 1920, when they were made to apply to all workers (excluding only domestic servants and agricultural laborers). During the period from November, 1920, to July, 1925, receipts in this fund (to which workers, employers, and the state contributed) totaled £203,133,528 and expenditures were £233,827,723.

The period following the termination of the general strike of 1926 saw a deficit in the fund of over £21,000,000. In 1927 the act was amended to reduce benefits for young people and men without dependents. Claimants also were to be called upon to accept "suitable" work not necessarily in their own trades. Unemployment continued to be a serious national question and in the general elections of May, 1929, the failure of the Conservative government to stem its increase was seized upon by the Liberal Party under Lloyd George as the chief reason why it should be turned out of office.

The newly-elected Labor government applied itself seriously to the formulation of a programme for the handling of the very serious unemployment situation. Mr. J. H. Thomas, holding the portfolio of the Lord Privy Seal, in the summer of 1929, made a special trip to Canada in the interests of British industry, particularly coal and steel. With the opening of Parliament in November, there was submitted Labor's proposals with respect to unemployment. These called for the immediate expenditure of \$200,000,000 on public-works programmes and allowed for the employment of 150,000 men for a year. The only help for the coal miners was to be the effort to extend the export markets for British coal and in this particular Mr. Thomas reported that Canada was to take 600,000 tons of English coal in 1929. Mr. Thomas did not seek to minimize the nature of the difficulties. He pointed out

that out of a total of 1,150,000 persons in receipt of unemployment relief, fully 800,000 were permanently unemployed. In the years between 1894 and 1913, the average rate of unemployment among trade unionists was 4 per cent; since 1921 it has been 11 per cent. That there has been a gradual improvement cannot however be denied in the light of the fact that from June, 1921, to November, 1929, the total unemployed has decreased from 2,560,000 to 1,150,000.

Germany. The employment situation in Germany was very bad in the fall of 1914, but it improved steadily during the four years of the War, due primarily to government efforts. The rapid demobilization at the end of the War caused a serious unemployment crisis. The Government started various measures for relief and in six months there was a marked improvement. The number of the unemployed was reduced from 1,500,000 at the beginning of 1919 to 500,000 at the end of the year. During the following years, the labor market continued to gain. The ratio of unemployed to the total number of workingmen was reported to be less than 1 per cent during the first seven months of 1922. After that, an increase in unemployment occurred, and at the end of 1923, there were 3,000,000 without work, 60 per cent of the workers were employed only two or three days a week during that year.

On Nov. 1, 1925, the number of workers in receipt of relief benefits was 363,961, on Mar. 1, 1926, the number was 2,055,928, on Dec. 15, 1927, 1,002,243; in 1927, a compulsory insurance act was passed. Premiums into this fund were to be paid by employers and employees at the same time that health-insurance premiums were paid. The same law set up a system of federal employment exchanges. Early in 1929, it was reported that the unemployment-insurance account showed an actual deficit, because of heavy unemployment. In fact, in February, 1929, it was reported that workmen entirely unemployed made up 19.4 per cent of the labor-union membership of the country. In addition to Great Britain and Germany, the following six countries also have compulsory unemployment insurance funds together with systems of unemployment exchanges: Italy, Austria, Russia, Queensland, Poland, and Irish Free State. Nine other countries had systems of voluntary unemployment insurance with state subsidies, viz., France, Denmark, Norway, the Netherlands, Finland, Spain, Belgium, Czechoslovakia, and Switzerland. See also SOCIAL INSURANCE.

Late in 1928, unemployment in the chief European countries appeared to be on the increase. For instance, there were more people not working in 8 out of 18 European countries in December, 1928, than was the case in December, 1927. In Germany, 16.7 per cent of the trade unionists were wholly unemployed in the 1928 month, as compared with 12.9 per cent in the 1927 month. In the Scandinavian countries, where the number of trade unionists unemployed was not so great as in the 1927 month, the percentages of unemployed among trade unionists was still very large. In Denmark, 25 per cent of the trade unionists were out of work and the figure was well over 17 per cent in both Norway and Sweden. In Italy, in December, 1928, 363,000 persons were registered as being wholly unemployed. See also SOCIAL INSURANCE.

UNIFLOW ENGINE. See STEAM ENGINES AND STEAM TURBINES.

UNION COLLEGE. A nonsectarian institution for men at Schenectady, N. Y., founded in 1795. The student enrollment increased from 474 in 1914 to 823 in 1928. During the same period, the faculty increased from 38 to 77 members, the library from 43,000 to 71,000 volumes; and productive funds from \$950,000 to \$4,000,000. In 1925 a Memorial Chapel was completed and in the following year physics and biology laboratories were built. In 1927 a three-story building for the housing of the liberal arts department was dedicated, and a loan fund of \$25,000 was established, the gift of Gerard Swope, president of the General Electric Company, primarily for the benefit of employees of that company. President, Frank Parker Day, LL.D., who was installed May 4, 1929.

UNION OF SOCIALIST SOVIET REPUBLICS. See RUSSIA.

UNION OF SOUTH AFRICA. See SOUTH AFRICA. UNION OF.

UNITARIAN CHURCH. A denomination, which, in the United States, developed within New England Congregationalism. The American Unitarian Association, organized in May, 1825, for missionary purposes, became the executive body of the denomination. The Unitarian Church imposes no theological test of membership on either the laity or clergy. It believes in one God in one person and, consequently, in the purely human personality of Jesus. Emphasis is placed on God in the inner life of man. On Jan. 1, 1928, the Unitarian Church had 442 churches, 386 of which were active, with 131,912 adherents, as compared with 353 active churches and 60,152 adherents in 1926 and 411 churches and 82,515 adherents in 1916. In 1928 there were 3273 Sunday-school teachers and officers and 21,526 pupils. In 1926, 3025 officers and teachers and 18,722 pupils. Receipts for current church activities in 1928 were \$367,527. Total expenditures in 1926 of 344 Unitarian churches, amounted to \$3,418,975, including \$255,759 for benevolences, while expenditures by 369 churches in 1916 were \$1,485,556. The value of church property, not including parsonages, increased from \$15,247,349 in 1916 to \$27,478,554 in 1926.

The church sponsors three theological seminaries: Harvard Divinity School, Meadville Theological School, Meadville, Pa.; and the Pacific Unitarian School for the Ministry, Berkeley, Calif.; and three schools for the training of parish assistants. General denominational work is carried on by the departments of publication, religious education, church extension, social relations, new Americans, foreign relations, recruiting the ministry, and others. The department of new Americans conducted missionary work among American citizens and particularly among immigrants of Icelandic, Finnish, and Norwegian origin. The department of foreign relations, functioning in place of a foreign-missions board, frequently extended aid to liberal religious movements in South America, Italy, the countries of north and central Europe, Egypt, India, China, Japan, and other lands. During the period 1914-29, Unitarian churches showed an increasing tendency to federate with like-minded liberal religious groups. The 1926 census figures are exclusive of 18 federated churches with a membership of 2838, in each of which a Unitarian unit was represented. Denominational publications are the *Christian Register* (weekly); the *Beacon* (weekly); and the *Uni-*

tarian World and Work (monthly). Headquarters of the American Unitarian Association are at 25 Beacon Street, Boston, Mass.

UNITAS FRATRUM. See MORAVIANS.

UNITED BRETHREN IN CHRIST, CHURCH OF. An outgrowth of the German Reformed and Mennonite churches, formally organized under the leadership of Philip William Otterbein and Martin Boehm in Maryland in 1800 and in 1889 divided into two bodies, the Old and the New Constitutions. Its theology is Arminian, while its polity is similar to that of the Methodist Episcopal Church. The membership of the Old Constitution decreased from 21,401 in 1906 to 17,872 in 1926. The larger division of the church, or New Constitution, had, in 1928, 406,678 members, as compared with 274,649 in 1906. The church is divided into 35 annual conferences, including those in China, Japan, the Philippines, Porto Rico, and West Africa. In 1928 there were 1756 charges; 3071 organized churches, 1647 itinerant ministers, 2882 Sunday schools with an enrollment of 387,348, including teachers and officers. The valuation of church property was \$28,754,501. The church maintains eight educational institutions in the United States, as well as the Otterbein Home, the United Brethren Orphanage and Home, and the Colonel R. M. Baker Home for Retired Ministers. In 1929 a preliminary plan of union was approved by the Evangelical Synod of North America, the Reformed Church in the United States, and the United Brethren in Christ.

UNITED CHURCH OF CANADA. See CANADA. UNITED CHURCH OF.

UNITED KINGDOM. See GREAT BRITAIN.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. A branch of the Presbyterian Church formed by the union of the Associate and the Associate Reformed churches in 1858 at Pittsburgh. In organization and government, it is in accord with other Presbyterian bodies, having the same courts-session, presbytery, synod, and general assembly, and observing the same general methods of baptism, admission to church membership, and ordination to the ministry. A confessional statement of 44 articles was adopted by constitutional action in 1925 to replace the Judicial Testimony of 1858. The membership from 165,186 in 1925 to 175,075 in 1928. The number of congregations, however, declined from 924 in 1924 to 898 in 1928; the number of presbyteries from 58 to 57; and the number of ministers from 937 to 916. The Sunday-school enrollment rose from 171,922 in 1924 to 177,589 in 1928; there were also 918 young-people's societies, with 26,837 members, in the earlier year, and 958 societies, which had 26,225 members, in the later year.

Church contributions increased from \$5,845,370 in 1924 to \$6,224,733 in 1928. The total value of church property and permanent funds of the denomination in 1928 amounted to \$47,830,333. Missionary contributions in that year amounted to \$1,639,382. The denomination supported 400 missionaries in India, Egypt, the Sudan, and Abyssinia, part of their work being accomplished in 31 hospitals and dispensaries, and 411 missionaries working at home. The educational work of the church is carried on at home and abroad through 333 schools, 9 colleges, and 4 theological seminaries. Contributions to the New World Movement, for the advance of the church's work, between 1919 and 1926 amounted to \$7,916,976.

UNITED STATES. The United States of America consists of 48 States and the District of Columbia, located between the 25th and 49th parallels, north latitude, and in addition the noncontiguous territories of Alaska, Hawaii, Guam, Panama Canal Zone, Philippine Islands, American Samoa, Porto Rico, and the Virgin Islands. The total land area of continental United States exclusive of Alaska is 2,973,800 square miles. The population at the 1920 census was 105,710,620; estimated population of July 1, 1928, was 120,013,000. The areas and populations of the noncontiguous territories are given in Table I.

TABLE I—AREA AND POPULATION OF THE UNITED STATES

Territory	Area Square miles	Population in 1920
Continental United States	2,973,774	105,710,620
Alaska	590,884	55,036
Guam	210	13,275
Hawaii	6,449	255,912
Panama Canal Zone	527	22,858
Philippine Islands	115,026	10,607,872
Porto Rico	3,435	1,299,809
American Samoa	77	8,056

POPULATION

The United States is the only important country of the world which has even a fairly complete history of the growth in population from its beginning. The First Federal Census was taken in 1790 and subsequent enumerations at 10-year intervals. In 1790 the total population of the United States, as then constituted, was 3,929,214 and at the last census in 1920 it was 105,710,620, an increase of 2565 per cent for the 130 years. Table II gives the population of continental United States at each census, together with the actual and percentage increases for each decade.

The Bureau of the Census estimates the total population for intercensal years and periods. Table III shows the estimated total population of continental United States on July 1 of each year from 1915 to 1928.

TABLE II—POPULATION OF THE UNITED STATES, WITH DECENNIAL INCREASES 1790-1920

Census year	Population	Total decennial increase	Per cent of increase
1790	3,929,214		
1800	5,308,483	1,379,269	35.1
1810	7,239,881	1,931,398	36.4
1820	9,638,453	2,398,572	33.1
1830	12,866,020	3,227,567	33.5
1840	17,069,453	4,203,433	32.7
1850	23,191,876	6,122,423	35.9
1860	31,443,321	8,251,445	35.6
1870	39,818,449 *	8,375,128 *	26.6 *
1880	50,155,783	10,337,334 *	26.0 *
1890	62,947,714	12,791,931	25.5
1900	75,994,575	13,046,861	20.7
1910	91,972,266	15,977,691	21.0
1920	105,710,620	13,738,354	14.9

* Estimated correction for error in census of 1870.

From 1790 to 1860, the population showed a relatively uniform rate of growth amounting to an increase of about one-third per decade. Had this ratio of increase continued after 1860, the total population of continental United States in 1920 would have been upward of 180,000,000.

The decline in the percentage rate of increase in the first three decades following the Civil War was very gradual. From 1860 to 1890, the average increase was approximately 26 per cent per decade. For 1890 to 1900, the rate dropped to 20.7 per cent. From 1900 to 1910, it was at 21 per cent, but for the decade between 1910 and 1920, the rate of increase showed a marked decline to 14.9 per cent. This sharp decline in the rate of increase for that decade is partly due to the decline in immigration and to the return of many former immigrants to their native land, during the War. Even if the effect of immigration and emigration is allowed for, however, there has been a very significant decline in the rate of population increase during that census decade. (See discussion by W. S. Rossiter: "Increase of population in the United States." *Census Monograph No. 1*, U. S. Bureau of the Census, Department of Commerce, 1922.)

The United States has passed the pioneer stage of development and it is probable that future censuses will continue to show moderate rates of increase characteristic of more fully settled and developed countries. The rates of increase in population for England and Belgium before the World War were between 10 and 11 per cent, while Germany increased 15 per cent, Italy 6.6 per cent, and France only 1.6 per cent per decade.

It is of interest to note, however, that although the rate of increase has been rapidly declining, the actual numerical increase in population has been relatively stationary for the past four decades. The relative numerical increase re-

TABLE III—ESTIMATED TOTAL POPULATION ON JULY 1 FOR INTERCENSAL YEARS

Year	Population July 1	Year	Population July 1
1915	99,343,000	1922	109,893,000
1916	100,758,000	1923	111,693,000
1917	102,171,000	1924	113,727,000
1918	103,588,000	1925	115,378,000
1919	105,003,000	1926	117,136,000
1920	106,422,000	1927	118,628,000
1921	108,445,000	1928	120,013,000

corded for any decade was 15,977,691 between 1900 and 1910. Between 1910 and 1920, the increase was 13,738,354. On the average, therefore, the United States was adding about 1,400,000 persons to its population each year, or almost 4000 persons per day. The increase alone during any one of the last four decades was greater than the entire population of the country in 1830.

Increase in Population by Geographic Divisions, States, and Cities. The distribution of population by geographic divisions and individual States for 1910 and 1920 and the increases for the decade, with comparisons with the percentage increase in the preceding decade, are shown in Table IV.

It is clear from the data in this table that there was a decided slackening in the westward migration of population, compared with the period between 1900 and 1910. In the last preceding decade, the population of the Pacific States increased 73.5 per cent and the Mountain States 57.3 per cent. Between 1910 and 1920, these two divisions continued to show higher percentages of increase than other sections of the country, but the rates of increase declined to 32.8 and 26.7 per cent, respectively. Only one of the nine geographic divisions showed a rate of increase in the last decade higher than in the decade 1900 to 1910. This was the East North Central Division consisting of the States of Ohio,

Indiana, Illinois, Michigan, and Wisconsin. This was the region which showed the most notable industrial expansion of this period. In marked contrast is the low rate of increase shown for the East South Central States and the West

was largely due to stabilized agriculture and absence of any marked industrial development.

The largest numerical increase occurred in the East North Central States, with a total of 3,224,972 more persons than in 1910. The Middle At-

^a A minus sign (-) denotes decrease

North Central Division. In the former region, the northward migration of Negroes during and after the World War was at least partly responsible for the low rate. In the West North Central States, the decline in the rate of increase

lantic States reported the next largest increase, amounting to 2,945,252; the South Atlantic Division increased 1,795,377, while the West South Central and the Pacific divisions each increased approximately 1,400,000.

Of the 48 States of the Union, 45 showed increases of population from 1910 to 1920. The three reporting decreases were Mississippi, 0.4 per cent, Vermont, 1 per cent, and Nevada, 5.5 per cent. The largest rate of increase for any State was 63.5 per cent in Arizona, followed by Montana with 46 per cent, California with 44.1 per cent, Wyoming with 33.2 per cent, Idaho with 32.6 per cent, and Michigan with 30.5 per cent. Six other States—Florida, New Jersey, Connecticut, Oklahoma, Ohio, and Utah—each showed rates of increase between 20 and 30 per cent for the decade.

Aside from the three States showing decreases, the five States showing the lowest rates of increase were New Hampshire, 2.9 per cent, Missouri, 3.4 per cent, Maine, 3.5 per cent; Kansas, 4.6 per cent, and Kentucky, 5.5 per cent.

Eight States contributed more than half of the total increase of 13,738,354 shown at the last census. These in the order of their contributions were New York, Pennsylvania, California, Ohio, Michigan, Illinois, Texas, and New Jersey. The first three each showed an increase of over 1,000,000 persons, while in the other five the increase ranged between 600,000 and 1,000,000 each.

At the 1920 census, there were 2500 cities in the United States having a population between 2500 and 25,000, 219 cities having from 25,000 to 100,000 inhabitants, and 68 having more than 100,000 persons. During the 10-year period, 1910

Of the 68 cities having 100,000 or more inhabitants in 1920, there were 25 which had a population of 250,000 or over. A study of the changes in the population of these 25 cities at the last two censuses illustrates the changing trends in large urban populations for the two decades.

Only four out of these 25 cities retained the same ranks in 1920 as they had in 1910, while 10 improved their positions and 11 took lower ranks than in 1910. Detroit moved from ninth up to fourth place, Los Angeles from seventeenth to tenth, while two cities, Portland, Oreg., and Denver, Colo., which were outside the first 25 in 1910, moved into this class in 1920.

Urban and Rural Population. There has long been observed in the United States a strong movement of population from the country to the city and this tendency seems to be increasing. The census defines urban population as that living in cities or other incorporated places of 2500 inhabitants or more.

In 1790 this country was substantially all rural. Only six cities had a population of 8000 or more. From this time, urban population has been increasing until at the 1920 census more than half of the population lived in cities of 2500 or over. Even as recently as 1880, 71.4 per cent of the population was rural and only 28.6 urban. In 1890 the proportions were 63.9 per cent rural and 36.1 per cent urban; by 1900 the

to 1920, 474 towns and other communities passed, because of population increases, into the class of cities having 2500 to 25,000 inhabitants. During the same period, 59 cities passed from this class into that having 25,000 to 100,000 population, while 18 left this class for the one comprised of cities of over 100,000.

By far the larger portion of large cities is located in the Eastern and Central industrial States. At the 1920 census, 38 out of the 68 cities of over 100,000 inhabitants were located in the three geographic divisions of New England, Middle Atlantic, and East North Central States. These 38 cities had a total population of approximately 19,500,000 out of an aggregate for the group of 27,500,000, also, 144 out of the 219 cities in the class 25,000 to 100,000 were located in these three divisions and they furnished 6,500,000 out of the 10,340,000 inhabitants in this class of cities.

latter proportion had moved to 40 per cent, and in 1910 to 45.8 per cent. In 1920, for the first time, urban population passed the halfway mark, forming 51.4 per cent of the total, while rural population made up only 48.6 per cent. Between 1910 and 1920, urban population increased by over 12,000,000, or 28.8 per cent while the rural population increased only 1,600,000, or 3.2 per cent. Part of this increase in urban population was due to the fact that 474 small towns which in 1910 had less than 2500 inhabitants had passed this mark by 1920 and were included as urban. Even if allowance is made for this, however, the predominating increase in urban population is still evident.

If the population living in all incorporated places instead of that in places of 2500 and over had been considered as urban, the total urban population in 1920 would have been 63,277,000, or 59.9 per cent of the total, and the rural popu-

lation only 42,434,000, or 40.1 per cent. On this basis, the corresponding proportions in 1910 were 54.7 and 45.3 per cent.

In 1920 the census for the first time compiled the numbers of persons living on farms or the total agricultural population. This figure was 31,614,219, or 30 per cent of the total population, and 61.5 per cent of the population classified as rural.

For the decade 1910 to 1920, the movement from rural to urban continued to be heaviest in the areas in which it began, i.e., the industrial North Eastern and North Central States. The three groups, New England, Middle Atlantic, and East North Central States, showed a stationary rural population from 1900 to 1910 and slight decreases for 1910 to 1920, while all of the heavy increases in these sections fell to the urban population. Even in the three Southern divisions of the country, the increase in urban population

noted after the Civil War in the decade between 1860 and 1870. No doubt the greater mortality of males due to the War, the emigration of more males than females, and perhaps an increase in the proportion of female immigrants tended to affect the 1920 ratio. The statistics show that about three-fifths of the decrease in the excess of males in 1920 was among the foreign-born white population.

With regard to nativity and color, the census divides the population into the following chief groups: (1) native whites of native parentage; (2) native whites of foreign parentage; (3) native whites of mixed parentage, (4) foreign-born whites; and (5) colored, separating the latter two classes by nationality. It would lie too far outside the scope of this article to treat this subject in detail. The accompanying table gives the more important classes and the rates of increase in each since 1890, in comparison with the total.

TABLE VI—INCREASE IN URBAN AND RURAL POPULATION 1890-1920

Census	Total	URBAN			RURAL		
		Increase	Per cent of increase	Per cent urban	Total	Increase	Per cent of increase
1890	22,720,223			36.1	40,227,491		
1900	30,380,433	7,660,210	34.2	40.0	45,614,142	5,386,651	13.4
1910	42,166,120	11,785,687	38.8	45.8	49,806,146	4,192,004	9.2
1920	54,304,603	12,138,483	28.8	51.4	51,406,017	1,599,871	3.2

in the last decade far exceeded the rural. Likewise, in the Pacific States, the urban increase was much greater than the rural. It was only in the mountain group of States (Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada) that the rural element showed a decidedly larger increase than the urban class.

Changes in Population Considered by Sex, Nativity, and Color. The following tabulation shows the sex distributions of the population of continental United States at each of the last three censuses

Census year	Males	Females	Males to 100 females
1900	38,816,448	37,178,127	104.4
1910	47,332,277	44,639,989	106.0
1920	53,900,431	51,810,189	104.0

It is a peculiarity of population statistics that the number of males in nearly all instances exceed the number of females. This has been true of every census of the United States since 1830, when for the first time the returns showed the sex of every person enumerated. In 1920 the number of males exceeded by more than 2,000,000 the number of females, which was a considerably smaller excess than in 1910 when the males exceeded females by nearly 2,700,000. Also, the

It is of interest to note that the rate of increase of whites in the decade 1910 was 18.6 per cent, compared with 14.9 per cent for the total population. For native whites of native parents, the rate of increase was 18.1. For the two classes not shown in the table, the native whites of foreign parentage increased by 21.5 per cent, a higher rate than that for any other group of the white population. In many urban and industrial sections, the rate of increase in this class of the population exceeded 30 per cent.

In 1920 the foreign-born white population totaled 13,712,754, which represented an increase of only 2.8 per cent over those shown in this class at the 1910 census. Foreign-born whites in 1920 formed only 13 per cent of the total population, but it is significant to note that of the adult male population over 21 years of age, they formed 22.1 per cent, or over one-fifth of the total.

The colored population increased only 6.5 per cent in this decade, as compared with 11.5 per cent in the preceding decade. The total colored population in 1920 numbered 13,712,754, of which 10,463,131 were Negroes, 244,437 American Indians, 111,010 Japanese, 61,639 Chinese. The increase in the total Negro population from 1910 to 1920 was only 635,000, or 6.5 per cent, the lowest ever recorded. The number of Indians de-

TABLE VII—GROWTH OF WHITE AND COLORED ELEMENTS IN POPULATION

Census year	Total population	Per cent of increase	Whites			Per cent of increase	Per cent of native parents	Per cent of increase	Foreign-born whites	Per cent of increase	Colored	Per cent of increase
			Total whites	Per cent of increase	Total native whites							
1890	62,947,714	24.9	55,101,258	26.7	45,979,391	24.5	34,475,716	20.2	9,121,867	39.1	7,864,456	16.2
1900	75,994,575	20.7	66,809,196	21.2	56,595,379	23.1	40,949,362	18.8	10,213,817	12.0	9,185,379	17.1
1910	91,972,266	21.0	81,731,957	22.3	68,386,412	20.8	49,488,575	20.8	13,345,545	30.7	10,240,309	11.5
1920	105,710,620	14.9	94,820,915	16.0	81,108,161	18.6	58,421,957	18.1	13,712,754	2.8	10,889,705	6.3

proportion of males to females was lower in 1920 than in any of the three preceding censuses. A similar decrease in the proportion of males was

clined by 21,246 in that decade while the Japanese increased 38,853, or 54 per cent, and the Chinese decreased by 9892.

Persons Gainfully Employed. In connection with the decennial enumeration, the Bureau of the Census also compiles the number of persons engaged in specified gainful occupations. These occupations are classified into nine main groups. The 1920 census showed a total of 41,614,248 persons gainfully employed, or a little less than 40 per cent of the total population. Of

NATIONAL INSTITUTE OF: AGRICULTURAL-EXTENSION WORK; AGRICULTURAL CREDIT; AGRICULTURE, UNITED STATES DEPARTMENT OF; HORTICULTURE; BOTANY; DISEASES OF PLANTS; TRACTOR; RECLAMATION; DAIRYING; LIVE STOCK; FOOD AND NUTRITION; FERTILIZERS; SOIL; AND VETERINARY MEDICINE. The articles on individual States consider local agricultural matters in detail.

TABLE VIII—COMPARISON OF AGRICULTURE WITH MANUFACTURES AND PRODUCTION OF MINERALS ON BASIS OF NUMBER OF PERSONS ENGAGED AND VALUE OF PRODUCT, BY GEOGRAPHIC DIVISIONS, 1919
Persons engaged in—

Geographic Division	Agriculture	Manufactures and production of minerals ^a	Value of agricultural products ^b	Value added by manufacture plus value of products of mineral industries ^c
United States	10,636,826	11,893,558	\$20,933,487,000	\$28,206,165,000
New England	221,162	1,543,095	463,106,000	3,249,884,000
Middle Atlantic	633,664	3,816,142	1,497,641,000	9,287,921,000
East North Central	1,586,291	3,091,676	4,323,955,000	7,596,274,000
West North Central	1,664,919	708,772	5,540,245,000	1,690,804,000
South Atlantic	2,114,586	1,073,132	2,509,661,000	2,211,625,000
East South Central	1,782,628	480,570	1,722,324,000	846,211,000
West South Central	1,781,389	413,863	2,702,169,000	1,220,595,000
Mountain	414,009	222,382	914,787,000	634,264,000
Pacific	438,178	543,926	1,259,599,000	1,468,587,000

^a Including production of oil and gas

^b Total value of crops plus total value of live stock products and domestic animals sold or slaughtered on farms; includes some duplication representing value of crops consumed by live stock.

the total number of workers, 24,862,000, or about 60 per cent, were employed in the basic industries of agriculture, mining, and manufacturing. The following tabulation gives the number of workers in each of the nine principal groups at the census of 1920.

Agriculture, forestry, and animal husbandry	10,953,158
Extraction of minerals	1,090,223
Manufactures and mechanical industries	12,818,524
Transportation	3,063,582
Trade	4,242,979
Public service (not elsewhere classified)	770,460
Professional service	2,143,889
Domestic and personal service	3,404,892
Clerical	3,126,541
Total	41,614,248

It is of some interest to present the geographic distribution of the number of workers in agriculture, compared with the number in manufacturing and mining combined. These figures, together with the value of the products of each group by geographic divisions, are shown in Table VIII.

Mineral Production. It was natural that the War should promote mineral production, and from 1914 to 1918 there was a continuous increase in the value of metallic and nonmetallic minerals mined. Table IX shows the striking rise of production through 1920, the reaction of 1921, and subsequent recovery, approximately maintained through 1927, with a slight decline in 1928.

Table X presents a survey of the principal minerals, by production and value, for the years 1913, 1920 (the peak year of the period), 1922, and 1927.

The more important minerals mined in the United States are treated under the following separate heads: COAL; COKE; COPPER; GOLD; IRON AND STEEL; LEAD; PETROLEUM; SILVER. See also ALUMINUM; ASPHALT, BAUXITE; CEMENT; GRAPHITE; GYPSUM; LIME; NATURAL GAS; PHOSPHATE ROCK; PLATINUM; QUICK-SILVER; RADIUM; TALC AND SOAPSTONE; STONE; SULPHUR, TIN; ZINC. The articles on the individual States contain sections on mineral production.

Year	Metallic Value	Nonmetallic Value	UNSPECIFIED (metallic and nonmetallic)	Total Value
1913	\$ 878,869,000	\$1,554,298,000	\$ 378,000	\$2,433,545,000
1914	686,639,000	1,424,061,000	470,000	2,111,172,000
1915	991,730,000	1,400,484,000	430,000	2,394,644,000
1916	1,620,745,000	1,884,413,000	3,281,000	3,508,439,000

Agriculture. General statistics and other information in respect to agriculture in the United States are given in the article AGRICULTURE. For special discussions of the important crops, see CORN, OATS, POTATOES, WHEAT, COTTON, etc. The following articles bear on agricultural activities: AGRICULTURAL EDUCATION, AGRICULTURE, INTER-

MANUFACTURES

At the end of the nineteenth century, the United States was known chiefly as an agricultural and raw-material-producing nation. The developments of the last two decades brought this country to the forefront as an industrial nation.

TABLE X—PRODUCTION AND VALUE OF PRINCIPLE MINERALS FOR 1913, 1922, 1928
Expressed in thousands)

If development continues in the future as it has in recent years, the eastern part of the United States will become firmly established as one of the highly industrialized areas of the world. The growth of industrial activity is best brought out by the data from the census of manufactures which are available at varying intervals since 1850. These figures are summarized in Table XI

The census of 1921 was the first of a series of biennial censuses of manufactures authorized by Congress. These relate only to establishments having products valued at \$5000 or more, whereas at previous censuses the corresponding limit was \$500. The Bureau of the Census stated that although the establishments with products valued between \$500 and \$5000 constituted 21.6 per cent of the total number of establishments in 1910,

TABLE XI—SUMMARY OF MANUFACTURING INDUSTRIES OF THE UNITED STATES, 1850-1927
Census year

Census year	No of establishments	No of wage earners—average	Wages paid	Value added by manufacturing			
				Cost of materials	Value of products	Value added by manufacturing	
				Millions of dollars			
1850	123,025	957,059 ^b	237	555	1,019	464	
1860	140,433	1,311,246 ^b	370	1,032	1,886	854	
1879	253,852	2,732,595 ^b	948	3,397	5,370	1,973	
1889	355,405	4,251,635	1,891	5,162	9,372	4,210	
1899	207,514	4,712,763	2,008	6,576	11,407	4,831	
1904	216,180	5,468,483	2,610	8,500	14,793	6,294	
1909	268,491	6,615,046	3,427	12,143	20,672	8,529	
1914	275,791	7,036,337	4,079	14,368	24,246	9,878	
1919	290,105	9,096,372	10,534	37,376	62,418	25,042	
1921*	196,357	6,946,570	8,200	25,337	43,653	18,317	
1923	195,580	8,764,491	10,999	31,481	60,258	25,778	
1925	187,390	8,384,261	10,730	35,897	62,668	26,778	
1927	191,866	8,354,000	10,848	35,133	62,718	27,585	

* The 1921 census of manufactures relates only to establishments having products valued at \$5000 or more, whereas at previous censuses the corresponding limit was \$500. It is estimated that establishments with products valued between \$500 and \$5000 contributed only 0.6 per cent of total wage earners and 0.3 per cent of the total value of products.

^b Includes salaried officials, clerks, etc.

It will be noted that the value of products as stated by the census rose from \$20,672,000,000 in 1909 to the maximum of \$62,718,347,289 in 1927, an increase for the period of over 200 per cent. The value added by manufacture in 1927

they represented only six-tenths of 1 per cent of the total number of wage earners and only three-tenths of 1 per cent of the total value of products. Consequently, their omission has only a slight effect upon the completeness of the data.

TABLE XII—COMPUTATION OF APPROXIMATE VALUE OF MATERIALS, PRODUCTS, AND VALUE ADDED BY MANUFACTURE AT 1889 PRICES
(In millions of dollars)

Year	Price Index	Cost of Materials		Value of Products		Value added by Manufacture	
		As Stated	At 1889 Prices	As Stated	At 1889 Prices	As Stated	At 1889 Prices
1899	100	6,576	6,576	11,407	11,407	4,831	4,831
1904	115	8,500	7,319	14,793	12,861	6,291	5,473
1909	129	12,143	9,413	20,672	16,025	8,529	6,612

1925	212	35,986	16,951	62,714	20,580	26,778	12,631

was \$27,585,792,755, or an increase of 67 per cent over the total for 1923. In 1925 it was \$26,771,373,163. The relative increase in the physical output of the manufacturing industry of the United States was about the same during the decade 1909-19 as during that preceding.

Another measure which may be employed to gauge the trend of the manufacturing industries independent of the price factor is the average number of wage earners employed as given in Table XIII. In this case, however, the increasing introduction of labor-saving machinery and the

Machinery is not included under *Iron and Steel* for 1927, while under *Vehicles* for 1927 is included vehicles for air and water as well as land transportation

varying efficiency of labor are factors which affect the results, but cannot be precisely gauged. In the decade between 1899 and 1909, the number of wage earners increased 40.3 per cent and between 1909 and 1919 the increase was 37.5 per cent. These figures agree fairly well with those arrived at from values of product computed at a constant price, if allowance is made for the above-mentioned factors. Between 1919 and 1921, however, the average number of wage earners declined from 9,096,000 to 6,947,000, a decrease of nearly 24 per cent. In 1923 the number of wage earners rose to 8,776,646 and then gradually decreased to 8,351,257 in 1927. That the output of manufacturing industries continued to increase despite the drop in wage earners, is evidenced by the rates of increase in the horse power of engines and motors in manufacturing establishments—8.1 per cent for the period 1923–25 and 9.1 per cent for 1925–26.

In 1850 the total value of products of the manufacturing industries of the United States was only \$1,019,000,000. By 1899 this amount had increased to \$11,407,000,000, by 1909 this latter value had been nearly doubled, and in 1919 had reached the enormous total of \$62,418,000,000, not exceeded until 1925. In 1927 the total value of products was \$62,718,347,289. Taking into account a change in the methods of compilation, this figure represents a decrease of two-tenths of 1 per cent in the value of manufactured products from 1925. The magnitude of the 1919 total was due partly to high prices, partly also to quantity of output. Some approximation to the increase in physical volume of production can be arrived at by reducing the figures for later years by the use of price-index numbers. Table XII gives figures on cost of material used, value of products, and value added by manufacture, from 1899 through 1925, (1) as stated by the Census and (2) estimated on the supposition that prices in succeeding periods had remained at the same level as in 1899. These latter computations are based on the all-commodity wholesale price index of the Bureau of Labor Statistics, U. S. Department of Labor. The index given in the first column of the table is the same as that computed by the Bureau except that for convenience the base has been transferred from 1913 to 1899. It must be remembered that the Department of Labor index is based on products which do not enter equally into manufacture and can give only

TABLE XIV—COMBINED SUMMARY FOR ALL MANUFACTURING INDUSTRIES, BY STATES, 1927 (Figures are for manufacturing and printing and publishing industries, as compiled from returns made at the biennial censuses for 1927. No data are included for establishments having products valued at less than \$5000.)

	Number of establishments	Wage earners (average for the year) ^a	Value of products ^b

Wisconsin	7,473	247,722	1,973,653,261
Wyoming	229	5,577	85,368,360

^a Not including salaried employees.

^b The amount of manufacturers' profits cannot be calculated from the census figures, for the reason that no data are collected in regard to a number of items of expense, such as interest on investment, rent, depreciation, taxes, insurance, and advertising.

rough approximations when used in this way. The resulting figures, however, serve to give some idea of the changing volume of the manufactures, apart from price changes, through 1921. After that year, changes in the yearly price index were moderate, the figure rising through 1925 and then declining to approximately the 1921 level for 1927.

Manufacturing Industries by Groups. The census classifies all manufacturing industries by general groups. These groups, together with some of the principal figures for the censuses of 1909, 1919, 1921, and 1927, are shown in Table XIII.

The most important group from the standpoint of value of products is that of foods and their products, which increased from less than \$4,000,000,000 in 1909 to \$12,439,000,000 in 1919. In 1925 the value was \$10,373,082,162 and in 1927, \$10,999,789,550. The two groups, textiles and their products and non and steel and their products, compete for the second place, although in 1927 the former group was well in the lead. A marked increase has occurred in the group of chemicals and allied products, which were valued

As to geographic groups of States, the greatest increase in value of products during the period 1914-27, was made by the East North Central group, including Illinois, Michigan, Indiana, Ohio, and Wisconsin. The value of the products produced in this division increased \$12,446,000,000 during the 13 years. The Middle Atlantic States, including New York, New Jersey, and Pennsylvania, ran a close second in actual increase. The value of products produced in this territory rose from \$8,054,000,000 in 1914 to \$19,540,000,000 in 1927, an increase of \$11,486,000,000. The greatest relative increase for any division was in the Pacific States, where the value of products rose from \$1,068,000,000 in 1909 to \$3,614,000,000 in 1927. This was followed by the West South Central States with an increase for the same 10 years of 264 per cent. The New England and South Atlantic States increased the value of their output by \$3,101,000,000 and \$2,945,000,000, respectively, during the period.

The three geographical divisions, New England, Middle Atlantic, and East North Central, contain the principal manufacturing industries. This territory, which may be described roughly

TABLE XV—CENSUS OF MANUFACTURES SUMMARY BY GRAPHIC DIVISIONS

^a The figures for 1914 are not strictly comparable with later years, due to the inclusion in this year and the exclusion in later years of establishments with products valued at less than \$5000 and data for the "Automobile repairing" and "Poultry killing and dressing" industries.

^b The figures for 1925 exclude data for the "Coffee and spice, roasting and grinding" industry which were not compiled for this year.

at \$1,527,000,000 in 1909, at \$6,438,027,055 in 1925, and at \$6,404,914,348 in 1927. Vehicles for land transportation show the development of the automobile industry. This group increased from \$562,000,000 in 1909 to \$4,059,000,000 in 1919, an increase for the 10 years of 622 per cent. In 1927 the value of automotive products proper was \$2,848,443,000, while the value of all land, air, and water vehicles manufactured was \$4,702,378,136. The heavy decrease in the output of the liquor and beverage group since 1919 coincides with the establishment of prohibition and the curtailment of legitimate liquor, wine, and beer manufacture.

Manufacturing Industries by States. The statistics of manufacture by individual States are to be found in the articles on the individual States such as have manufacturing industries of relative importance. Table XIV summarizes the manufacturing activities of the State, in 1925; Table XV summarizes manufacturing activities in the various geographic divisions in 1914, 1925, and 1927.

as east of the Mississippi and north of the Ohio and the Mason and Dixon line, produced 72.7 per cent of the value of all manufactured products in 1909, 71.8 per cent in 1919, and 71 per cent in 1925. See also articles: MOTOR VEHICLES; FOOD AND NUTRITION; IRON AND STEEL; BOOTS AND SHOES; LEATHER, RUBBER, SILK, ARTIFICIAL, TEXTILE MANUFACTURING; WATER POWER; PAPER AND WOOD PULP; SHIPPING; SHIPBUILDING; MOVING PICTURES, RADIO, and the section *Manufactures* in the articles on the individual States.

FOREIGN COMMERCE

The World War had a marked effect upon the foreign trade of the United States. For the five pre-war years, 1910 to 1914 inclusive, the average exports of domestic merchandise amounted to \$2,130,000,000 per year, while imports averaged \$1,689,000,000. During the next five years, 1915 to 1920, domestic exports averaged \$6,161,000,000 and imports \$3,223,000,000. The foreign trade of this country reached its maximum in

1928	5,030	99	5,129			4,091		79.8	+1,038	+411	+1,449

1920, when domestic exports totaled \$8,080,000,000 and imports \$5,278,000,000. After that, the value of the foreign trade declined, amounting to \$3,765,000,000 for exports and \$3,113,000,000 for imports in 1922. Foreign trade recovered gradually from the depression of 1922; in 1927 domestic exports totaled \$4,758,864,000; imports, \$4,184,742,000. In 1928 domestic exports totaled \$5,030,000,000 and imports, \$4,091,000,000.

In order to understand the true significance of changes in the value of trade, it is necessary to know whether they are caused by changes in quantity, fluctuations of price, or a combination of these two factors. For this reason, it is desirable to make periodic studies of the price movements of both exports and imports and of the quantitative changes in the trade. The most satisfactory method of estimating these changes

TABLE XVII—INDEXES OF CHANGES IN QUANTITY, PRICE, AND VALUE OF GENERAL IMPORTS AND EXPORTS OF UNITED STATES MERCHANDISE

Year	Exports of United States merchandise			General imports			Domestic wholesale price index

1924	130	86	113	113	94	106	97

is by the calculation of price indexes which are weighted by the quantities of the commodities entering the trade. Changes in the quantitative volume of trade are then obtained by adjusting the total value figures by these price indexes. Table XVII shows indexes of both price and quantity of exports and imports, respectively, calculated in this manner. The recently revised index of wholesale prices, constructed by the Bureau of Labor Statistics, is included in Table XVII for comparative purposes and all indexes are shown on both a pre-war and a post-war base.

Export prices more than doubled during the War and advanced in 1920 to a peak almost two

post-war deflation in 1922 was much sharper and more prolonged than in the case of exports. As a result the index of import prices, which had shown a smaller increase during the War than that of exports, in 1925 returned to approximately its pre-war relationship with exports. During the years 1925-28, average import prices showed a considerable decline which about paralleled that shown by exports in 1926 and 1927. The commodities which showed the most marked decreases in price after 1925 were rubber, sugar, silk, wool, and tin. Prices of hides and skins and copper, on the other hand, showed a net increase during this period.

Although both exports and imports were larger

TABLE XVIII—FOREIGN TRADE OF THE UNITED STATES BY COMMODITY GROUPS *

and one-half times as high as in 1913. A drastic decline followed in the two succeeding years, but there was a moderate recovery in 1923. After three years of fairly stable prices another decline set in which continued through 1927. This, in turn, was followed by another period of relative stability in 1928, as increases in the average prices of cotton and copper about offset lower prices of wheat, iron and steel, petroleum products, and meats.

Import prices had a very similar trend to that shown by exports, although the magnitude of the changes varied somewhat. The recovery from the

in post-war years than they were before the War, imports expanded much more than exports, both in value as stated and in volume. This change in the trend of trade toward a closer balance between exports and imports was largely the natural result of the War and its accompanying developments.

The great expansion of United States industries required larger supplies of raw material, much of which, such as silk and rubber, must be imported. From 1923 to 1927, the rapid economic return of the United States to normality gave it an advantage in the export field, thus promoting

export growth. The shift of the United States from a debtor to a creditor nation rendered a large favorable balance in merchandise trade less necessary, as well as less desirable, in some respects, but a large yearly export balance was nevertheless achieved.

9.4 per cent, respectively, in 1928. In the same year, Oceania received 3.5 per cent and Africa, 2.3 per cent, while Europe took only 46.3 per cent. This was the lowest proportion of our exports ever sent to Europe in any year for which records are available.

TABLE XIX—FOREIGN TRADE OF THE UNITED STATES BY GRAND DIVISIONS

(Values in Millions of Dollars)

Total	2,166	100.0	3,832	100.0	5,129	100.0

The increase in the exports of manufactured products is evidenced in the data in Table XVIII. Before the War, crude materials formed approximately one-third of both exports and imports, while manufactured goods ready for consumption formed 31 per cent of exports and 23 per cent of imports.

In 1928 manufactures that were ready for consumption formed over 44 per cent of the total exports and crude materials only 25 per cent. In imports, the opposite tendency was found,

In the case of United States import trade, some 50 per cent was received from Europe before the War. In 1918 the proportion coming from that grand division fell as low as 14 per cent, but later it increased, amounting to 31.8 per cent in 1922 and 30.5 per cent in 1928. The proportion of imports from North American countries increased from an average of 20.6 per cent for the five pre-war years to 23.5 per cent in 1928, while those from Asia amounted to 15.3 and 28.6 per cent for the same periods. Small increases oc-

with crude materials becoming more important than formerly, although showing a gradual decline after 1925.

Before 1914 only two of the six grand divisions were important purchasers of products from the United States. These were Europe and North America, which together in the five pre-war years, 1910-14, took an average of 85.5 per cent of all exported goods. Europe alone took 62.3 per cent; North America, 23.2 per cent, while 5.6 per cent each went to South America and to Asia, 2.2 per cent to Oceania, and 1.1 per cent to Africa. The significant change after the War was the increased proportion going to Asia, which in 1928 took 12.7 per cent of all exports. The proportions going to North America and to South America also increased, amounting to 25.7 and

curred in the proportion of imports from the other three grand divisions.

The individual countries of most importance in the foreign trade of the United States are shown in Table XX. The five countries which have been the most important purchasers of goods from this country are the United Kingdom, Canada, Germany, France, and Japan. The United Kingdom took an average of 26.2 per cent of our total exports before the War and 16.5 per cent in 1928. Canada took 14.5 and 17.9 per cent in the same two periods, while the trade with Germany declined from 14 per cent pre-war to 9.1 per cent in 1928. Japanese trade increased from 2.1 per cent before the War to 5.6 per cent in 1928, while France took 6.5 per cent of the total in pre-war years and 4.7 per cent in 1928.

In the case of imports, Canada, the United Kingdom, Japan, Cuba, and the British East Indies were of most importance. The proportion from the United Kingdom declined compared with the pre-war period, while that from each of the other countries mentioned increased. Germany, which before the War furnished 10.4 per cent of the total imports, sent only 5.4 per cent in 1928.

As shown in Table XXI, unmanufactured cotton is by far the most important single commodity exported from the United States. Even in recent years, when quantity export was smaller than

before the War, the rise in price was sufficient to make the total value much greater than before the War. Petroleum and its products ranked second, while automobiles and parts ranked third as early as 1923, although before the War they were of very much smaller relative importance. Coal, tobacco, pork products, wheat and flour, copper, and lumber were among the other important exports.

Table XXII shows a few of the most important

TABLE XXII—IMPORTS OF LEADING COMMODITIES

[In millions and tenths of millions of dollars. Figures represent General Imports]

Commodity	Value			
	1910- 1914	1921- 1925	1927	1928
Silk, raw	77.1	348.1	390.4	368.0

Tin	41.5	56.5	100.9	87.0

commodities imported into the United States. Of these, silk and coffee are in the first rank, with rubber, sugar, paper, and hides and skins followed in their order. Each of these commodities shows a large increase both in volume and value in the post-war, compared with pre-war years. The largest increases in the actual quantity imported occurred in the case of paper, rubber, and silk. The decrease of \$135,000,000 in

imports of crude materials, which was the most noteworthy development in the import trade of the United States during 1928, was very largely the result of lower average prices of rubber and silk, but it was accentuated by decreases in the quantity of leaf tobacco, cotton, wool, and furs imported. See also the articles: SHIPPING; SHIPBUILDING; PANAMA CANAL.

RAILWAYS

The total railway mileage operated in the United States on Dec. 31, 1927, according to the Interstate Commerce Commission, was 262,091, including 1753 miles of American-owned road in Canada, but excluding 782 miles in Alaska, and 289 miles in Hawaii. In 1912 the mileage in operation was 249,852; in 1916 (the peak year) it was 266,381, and in 1922, 261,984. After the

beginning of the World War in 1914, railroad building declined, consisting mainly of the completion of unfinished projects. There was considerable abandonment after 1920.

Railroad Traffic. Railroad development of late years has reached a culmination of the

growth in mileage, but there has been further increase in traffic. Between 1890 and 1920, the operated mileage increased 57 per cent, while the number of passengers carried rose from 492,000,000 to 1,235,000,000, an increase of over 150 per cent. The number of passenger miles increased

Equipment. In the matter of equipment, the railroads showed comparatively small increases after 1910. In that year, the total number of locomotives in service on the steam roads was 60,019, while at the end of 1920, the number was 68,942, and on Dec. 31, 1926, only 66,816.

nearly 300 per cent. The tons of freight carried rose from 632,000,000 in 1890 to 2,260,000,000 in 1920, or more than 250 per cent, while the freight ton-miles increased 432 per cent. The passenger traffic total declined after 1920 to 874,589,000 for 1926. The freight traffic total for 1926 was 2,627,492,000 tons, not greatly ahead of the 1920 figure. Motor-vehicle competition apparently reduced passenger traffic and captured part of the freight traffic in certain remunerative classes. The Panama Canal route competed for coast-to-coast freight

In tractive power, the average steam locomotive had increased from 27,282 pounds in 1910 to 41,886 pounds in 1926. In total tractive power, therefore, the locomotive equipment in 1926 showed a gain of over 50 per cent, compared with 1910.

The number of passenger cars increased from 47,179 in 1910 to 56,855 in 1926; freight cars increased from 2,148,478 in 1910 to 2,403,967 in 1926.

Finances. As a result of the demand made upon the roads during the War, including opera-

tion under government management and the difficulties experienced in the reconstruction period, the railroads of the United States suffered financially. The total railroad capital, outstanding, including stocks and bonds, amounted to \$18,417,000,000 in 1910. By 1915 this had

TABLE XXVII—RAILROAD EMPLOYEES AVERAGE NUMBER AND COMPENSATION

Year	Average number of employees	Total annual compensation	Average compensation per employee
1900	1,017,658	\$ 577,264,841	\$ 567
1910	1,699,420	1,143,725,306	673
1915	1,491,849	1,236,305,445	829
1918	1,841,575	2,613,813,851	1,419
1919	1,913,422	2,843,128,432	1,486
1920	2,022,832	3,681,801,193	1,820
1921	1,680,617	2,765,236,353	1,665
1922	1,645,244	2,669,180,772	1,622
1927*	1,735,105	2,910,182,848	1,677

* Figures for 1927 are for Class I steam railways, which employ 95 per cent of all railway workers.

increased to \$21,128,000,000, a gain of \$2,711,000,000. During the next five years, the gain was only \$663,000,000. The total in 1926 was \$23,877,000,000. In 1910, the total dividend and interest payments amounted to \$805,000,000, but in 1920 to less than \$759,000,000, and in 1926 to \$1,055,000,000.

The largest single item of expense in the railroad budget was that for wages. In 1910 the average number of employees on the railroads was 1,699,000, the payroll, \$1,144,000,000, which was an average of \$673 per employee. In 1920 the number of employees was 2,022,832, while the payroll had increased more than 200 per cent, or to \$3,681,801,000, and average annual compensation was \$1820. After that, with the railroads under private management, there was some decrease, but in 1926 employees numbered 1,821,804 and compensation was \$2,946,114,000 (total), and \$1656 (average).

HISTORY

Wilson Administrations. President Wilson was inaugurated on Mar. 4, 1913, the first Democratic President since Cleveland. He was re-elected in 1916. During his two terms in office, he selected for his official family the following men: Secretary of State W. J. Bryan (to 1915), Robert Lansing (to 1920), B. Colby; Secretary of the Treasury: W. G. McAdoo, C. Glass, D. F. Houston, Secretary of War: L. M. Garrison, N. D. Baker, Attorney General J. C. McReynolds, T. W. Gregory, A. M. Palmer; Postmaster General, A. S. Burleson; Secretary of the Navy, J. Daniels; Secretary of the Interior, F. K. Lane, J. B. Payne; Secretary of Agriculture D. F. Houston, E. T. Meredith, Secretary of Commerce W. C. Redfield, J. W. Alexander, Secretary of Labor, W. B. Wilson.

Domestic Legislation.—A Democratic Congress under the leadership of Wilson accomplished much of importance in the country's domestic affairs.

Tariff Revision.—Shortly after his election, President Wilson called the Sixty-third Congress into session (Apr. 7, 1913) to revise the tariff downward. Wilson, believing in a closer relationship between the executive and legislative branches of government, delivered his message to Congress personally, thereby breaking a precedent which had existed from the time of the elder Adams. The leadership in the tariff revision was taken by Oscar Underwood, of Alabama, the chairman of the ways and means committee.

The Tariff bill was passed in the House without any special difficulty, but the Democratic majority of six in the Senate was scarcely large enough to pass it in toto. The usual bargaining and compromises followed. The Underwood Act as finally passed made an average reduction of 26 per cent on the figures of 1907. The protective system was maintained although an attempt was made to allow a moderate amount of foreign competition. The duty on 958 articles was reduced, on 307 it remained unchanged, and on 86 (mainly in the chemical schedule) it was raised. There was to be no duty on wool after Dec. 1, 1913; the duty on sugar was to be gradually reduced and taken off completely on May 1, 1916; duties on woolsens and cottons were heavily reduced. The sugar provisions were never completely carried out owing to the international situation. An important feature of the tariff bill was the income-tax provision which was made

possible by the Sixteenth Amendment, which was proclaimed in effect Feb. 25, 1913. The law provided a tax of 1 per cent on incomes over \$3000 (\$4000 in the case of married persons), with an additional 1 per cent on incomes of \$20,000 to \$50,000; an additional 2 per cent between \$50,000 and \$75,000; 3 per cent between \$75,000 and \$100,000; 4 per cent between \$100,000 and \$250,000; 5 per cent between \$250,000 and \$500,000; and 6 per cent above \$500,000. The tariff board which had been created by the Republicans was allowed to lapse by the Democrats, but was revived in 1916 by the appointment of a bipartisan commission of six members for 12-year terms. See **TARIFF IN THE UNITED STATES AND TAXATION IN THE UNITED STATES.**

Federal Reserve System.—As soon as the question of the tariff was out of the way, Congress and the President turned their attention to banking and currency. The result was the passage in December, 1913, of the Federal Reserve Act. This act continued the prohibition of the issuance of State bank notes; it put the control of the system in the hands of a group of Federal officials known as the Federal Reserve Board; it created 12 Federal banks; to one or another of these institutions, every National bank had to become affiliated; other banks were allowed to become members; to provide for elasticity of currency, the act permitted the issuance of paper money backed up largely by sound commercial paper. (See **FINANCE AND BANKING.**) In order to relieve the situation of the farmers, the Federal Reserve Act was supplemented by the Federal Farm Loan Act of 1916. Under this law, farm-loan associations were formed in designated areas under conditions prescribed in the law, their members being borrowers only. The borrowers might obtain loans under specified conditions and restrictions as to size, security, and valuation of the land. See **AGRICULTURAL CREDIT.**

Anti-trust Legislation.—President Wilson appeared before Congress on Jan. 14, 1914, and in introducing the question of trust regulation, he urged that the problem be approached in a friendly way "in a common effort to square business methods with both public opinion and the law." Despite this statement, Wilson said that it was the purpose of the Democrats "to destroy monopoly and maintain competition as the only effective instrument of business liberty." Two important acts were passed in connection with trust regulation, the Federal Trade Commission Act of Sept. 14, 1914, and the Clayton Anti-trust Act of October 15. The first law created a commission of five persons to carry out the anti-trust laws and to prevent unfair methods of competition. The Clayton Act prevented price discrimination, acquisition of stock in competing companies, interlocking directorates, and the so-called "government by injunction." In 1918 a further trust act provided that the anti-trust acts should not apply to companies engaged in export trade. See **TRUSTS.**

Labor Legislation.—The Clayton Act contained very important provisions concerning labor. Human labor was declared not to be a commodity, and therefore labor and agricultural organizations could not be considered combinations in restraint of trade. Injunctions in labor disputes were forbidden unless necessary to prevent irreparable injury to property rights for which there was no remedy at law. Strikes, picketing, and boycotting were declared not to contravene any Federal law. Finally, cases of contempt of

court were to be tried by jury, except when the offense was committed in the presence of the court.

In 1915 the *La Follette Seamen's Act* was passed. This required a language test, namely, that 75 per cent of the crew on American-owned or operated vessels should "understand any orders given by the officers of such vessel"; that 65 per cent of the deck crews employed on American vessels should ultimately be able seamen, having passed physical and professional examinations by government officers; made less serious the offense of desertion by members of the ship's crew under special conditions, required half payment of wages to the crew in every port; and required refusal of clearance to a vessel on information of noncompliance in certain particulars. This law lost a good deal of its force through its loose phraseology and diverse constructions put on it by the Department of Commerce. American shipowners claimed that they would be unable to meet foreign competition under the provisions of this act and would be compelled to go out of business.

In 1916 the *Adamson Eight-hour Law* was passed, affecting railway labor. This act was virtually forced on Congress by the threat of a great strike by the four railway brotherhoods. The chief provision of this act was that from Jan. 1, 1917, employees engaged in train operation on inter-State steam railroads exceeding 100 miles in length should be paid their present daily wage for the first eight hours and should be paid pro rata for overtime rather than on the basis of time and a half, which was demanded by the brotherhoods. A commission was to be appointed by the President to report back to Congress on the wage increase by Nov. 1, 1917. See **RAILROADS**.

Further labor measures of importance provided for compensation for Federal employees injured in the performance of their duty, the prohibition of child labor under certain conditions, and an eight-hour day for Alaskan coal miners. For the vicissitudes of the attempt on the part of President Wilson and Congress to regulate child labor through the Federal control over interstate commerce and taxation, see **CHILD LABOR**. In 1917 Congress passed an act appropriating millions of dollars to the various States in aid of vocational education. See **EDUCATION IN THE UNITED STATES**.

Prohibition Amendment—For a complete account of this amendment, including its introduction and passage in Congress, its ratification by the several States, and the passage of the Volstead Enforcement Act, see **PROHIBITION**.

Woman Suffrage Amendment.—See **WOMAN SUFFRAGE**.

Colonial and Foreign Policies. Philippines. As the question of the independence of the Philippine Islands had figured very importantly in Democratic platforms since 1900, President Wilson continually urged on Congress the advisability of giving the islands greater self-government and of definitely promising them their independence. The result was the Jones Organic Act, passed in 1916, which declared in its preamble that it was the purpose of the United States to recognize the independence of the islands as soon as a stable government should have been established. The Jones measure abolished the old commission and provided for an Upper House elective for all but two members. The suffrage was extended to all males who spoke and wrote a native dialect. Formerly, the

vote was limited to some 225,000 inhabitants. Under the Jones Bill, 800,000 could vote. See **PHILIPPINE ISLANDS**.

Porto Rico.—In 1914 President Wilson, by executive order, directed that the Porto Rican Council be changed, so that natives should have a majority. The question of citizenship was settled on Mar. 2, 1917, when President Wilson signed a Porto Rican civil-government bill that extended the suffrage, granted an elective Upper House, and conferred full American citizenship on all inhabitants. See **PORTO RICO**.

Alaska.—On Mar. 2, 1914, an act authorizing the President to construct, maintain, and operate railroads in Alaska not exceeding 1000 miles in length, at an expense not exceeding \$35,000,000, was approved. The line was built during the years 1915-23. See **ALASKA**.

The Caribbean.—Although the Democrats followed the policy of granting a greater degree of freedom to the American colonies, they nevertheless greatly expanded the doctrine of Roosevelt in the Caribbean and Latin America by knitting more closely the financial and economic ties which bound the United States to these Spanish republics, and virtually established protectorates over several of them. This policy was contrary to that which many believed the Democrats would follow. (See **CUBA** and **PANAMA**.) Roosevelt's financial supervision in Santo Domingo was superseded by a virtual protectorate during Wilson's administration. American Marines were landed in 1914 to "oversee" the elections. In 1916 the entire country was occupied by American military forces. The government and laws of the country were suspended, and the American Marines maintained a military administration until the establishment of a provisional civil government in 1922. See **SANTO DOMINGO**.

Haiti fell under American domination as a result of revolution in 1915. American marines were landed to restore order. By terms of a treaty virtually forced on the Republic, the control of the finances and the constabulary was taken over by American officers, with the announcement that "the United States government has no purpose of aggression and is entirely disinterested in promoting this protectorate." The occupation was continued until 1924. See **HAITI**, under *History*.

Nicaragua.—For the terms of the establishment of the protectorate in 1916 and later intervention, see **NICARAGUA**, under *History*.

Undoubtedly, one of the prime reasons for this extended American influence in the Caribbean was the protection of the Panama Canal. In consonance with this policy, the American government purchased the Danish West Indies in 1917. See **VIRGIN ISLANDS**, see also **CENTRAL AMERICAN UNION**. See **NICARAGUA** for a discussion of the acquisition of a naval base in Fonseca Bay and a 99-year lease on the Corn Islands.

Panama Canal Tolls Act.—President Wilson by exercising his power as leader of the Democratic Party, secured the repeal of the Canal Tolls Act which had been passed in the latter part of Taft's administration. The issue had arisen because of the protest of Great Britain that the Hay-Pauncefote Treaty had been violated by the exemption of American coastwise vessels from paying tolls. For the treaty with Colombia, see **COLOMBIA**, under *History*.

Mexico.—President Wilson inherited a jumbled Mexican situation from his Republican pre-

decessor. After the murder of Madero in 1913, the country was torn into factions, and civil strife was prevalent under the leadership of Huerta, Zapata, Villa, and Carranza. The last was succeeded by Obregon. Although President Wilson shortly after his inauguration announced a policy of "watchful waiting," he was embroiled in two serious conflicts with Mexico, the Tampico and Columbus affairs. The tendering of their good offices by Argentina, Brazil, and Chile averted a serious conflict in the former instance. See MEXICO, under *History*.

The Far East.—Relations with Japan were strained by the passage of laws by the State of California prohibiting the ownership of lands by aliens who could not be naturalized. Japan protested against the discrimination and the violation of treaty rights, and the President sent Secretary of State Bryan to California in an effort to secure a change in the State legislation, without success. The countries exchanged notes and a *modus vivendi* was finally arranged whereby the United States agreed to test the laws in the courts, and Japan made promises as to future immigration. In 1917 Secretary of State Lansing and Viscount Ishii, special Ambassador from Japan, concluded an important agreement concerning American relations in the Orient. The United States admitted the interest of Japan in China, but both countries agreed to oppose the acquisition by any country of special rights in China which would tend to impair her integrity and sovereignty. (See JAPAN, under *History*; IMMIGRATION.) On May 2, 1914, President Wilson recognized the Republic of China. See CHINA.

Dependencies. For the outlying possessions of the United States, see the articles: ALASKA, GUAM, HAWAII, PHILIPPINES; PORTO RICO, SAMOA, AMERICAN; VIRGIN ISLANDS.

Matters pertaining to American activities are also discussed in the following articles: FISHERIES, FINANCE AND BANKING; TELEPHONY; TELEGRAPHY, ELECTRIC MOTORS IN INDUSTRY; ELECTRIC POWER TRANSMISSION; AERONAUTICS; ARMIES AND ARMY ORGANIZATION; NAVIES OF THE WORLD, EDUCATION, UNIVERSITIES AND COLLEGES, LAW, PROGRESS OF THE. See also the separate articles of the American religious denominations, universities and colleges, and the important cities.

World War. The World War, at the beginning of which the United States promptly declared its neutrality, had immediate important economic and legislative effects on the country. In August, 1914, a bill was passed admitting foreign-built ships to the American registry with certain restrictions as to coastwise trade. A War Risk Insurance Act was adopted, providing for emergency insurance for ships. It was promptly seen that the stopping of a large part of the imports would curtail the revenues and produce a deficit. To prevent this development, an emergency revenue bill was passed, providing for an increased internal-revenue taxation system. The election of 1914 had for its issues the new tariff law and the record of the President. The Democrats were successful in retaining their majorities in Congress, but they were reduced in the House, alignment being 232 Democrats, 194 Republicans, and 7 Progressives. In the Senate, the number of Democrats was increased to 53. The War greatly increased the export trade, especially in foodstuffs and munitions. Nearly all of this went to the Allies, since German ship-

ping had been practically driven from the sea. To meet the demand for more shipping, the President introduced in December, 1914, the request for a ship-purchase bill. The proposition evoked such opposition that the Republicans, in February, 1915, in a prolonged filibuster in which they were aided by seven Democrats, defeated it. As the United States was the leading neutral, the exigencies of war were bound to affect her rights on the high seas. Before the War had lasted very long, intricate complications developed with both Germany and Great Britain. (For details, see WAR, DIPLOMACY OF THE.) To Germany, Secretary Bryan sent a note declaring that the United States would hold her to "strict accountability," and to Great Britain a firm protest against the prevention of legitimate American trade by means of illegal blockade, interference with mail, and vexatious delays in prize proceedings. Deep irritation had been caused by the destruction of the steamer *Gulflight* by a German submarine and by the seizure of the *Wilhelmina* and *Dacia* by Great Britain and France. The United States, however, was horrified when, on May 7, 1915, the *Lusitania* was torpedoed without warning and more than 1000 persons, including 114 Americans, lost their lives. On May 13, Wilson sent to Germany a strong note demanding a disavowal of the act and indemnity for the violation of American rights. A strong party demanded war, and there developed an agitation for military preparation. A large number of Americans of German birth and descent, on the other hand, thought that the United States should preserve neutrality by prohibiting the export of munitions, which because of the control of the sea went to the Allies exclusively. Notes were interchanged, and the tone of the American notes became more insistent, until on September 1, Germany declared that liners were not to be sunk without warning. Despite the fact that the cases of the *Nebraskan* and the *Arabic*, disavowed on October 5, had arisen and depended on separate negotiations, this announcement was hailed as a Wilson victory. There remained the necessity for Germany to disavow the sinking of the *Lusitania* and to indemnify American citizens. Wilson's position in the correspondence had caused the resignation of Secretary Bryan (June), who urged that Americans should be warned to remain off passenger ships of the warring nations. In the meanwhile, among German sympathizers many plans were made for interfering with the supplies to the Allies by fomenting labor disturbances; plots were formed and executed, involving the explosion of bombs in factories and on steamships. The Austrian Ambassador, Dumba, was implicated, and his recall was demanded on Sept. 9, 1915. Attachés Boy-Ed and von Papen, of the German Embassy, had a similar fate on December 3.

In December, 1915, the President's message was almost wholly devoted to the championship of military preparedness, although the year before he had opposed those who would turn America into an armed camp. In February, 1916, Secretary of War Garrison resigned, alleging that President Wilson had not supported his plan of national defense. He was succeeded by Newton D. Baker (q v.), of Cleveland, Ohio. In December, 1915, the sinking of the *Persia* in the Mediterranean Sea again brought the controversy over submarine warfare to the fore. While negotiations were pending over this incident, the

channel boat *Sussex* was torpedoed with a loss of more than 100 lives; the *Sussex* was strictly a passenger vessel and unarmed. The question of arming merchantmen for defense presented a serious problem. A resolution warning Americans not to sail on armed merchantmen, presented in Congress, failed to pass. On Apr. 14, 1916, the United States government demanded that submarine warfare, as it affected neutrals, be abandoned under a penalty of a break in diplomatic relations. For the German reply, see **WORLD WAR, DIPLOMACY OF THE.**

Election of 1916. In 1916 Charles E. Hughes and Woodrow Wilson were the candidates nominated for the Presidency by the Republican and Democratic conventions, respectively. Charles W. Fairbanks and Thomas R. Marshall were the vice-presidential nominees. An element of the Progressive Party nominated Theodore Roosevelt for President, but he declined, and supported Hughes. Wilson was reelected by an extremely small margin, and the issue was in doubt for several days. It was decided only by his success in winning the electoral vote in California. The electoral vote stood 277 for Wilson, 254 for Hughes. The popular vote was 9,128,837 for Wilson, 8,536,380 for Hughes. The surprising thing about this election was the fact that Wilson was able to be elected without carrying New York, or any other of the large Eastern States. In the House, 217 Republicans were elected, 212 Democrats, and 6 from other parties. In the Senate, the Democrats retained their majority, which was cut from 14 to 12.

The War Again. Throughout 1916 the United States was brought nearer to war with Germany. The German submarine, *U-53*, entered Newport Harbor on Oct. 7, 1916, and after departing sunk one Dutch, one Norwegian, and three British ships within sight of the American coast. The submarine escaped unharmed. The President during December, 1916, and January, 1917, endeavored to secure from both sides a statement of terms on which the War could be honorably concluded. (See **WAR, DIPLOMACY OF THE.**) Following closely on these efforts, Germany, intensifying submarine warfare, declared that all merchant ships found in a forbidden zone would be sunk after Feb. 1, 1917, without warning. (See **WAR, DIPLOMACY OF THE.**) President Wilson addressed both Houses of Congress on February 3 and declared that he had directed the Secretary of State to announce to the German Ambassador that all diplomatic relations were severed. The President further declared that he hoped that Germany would not actually embark on the ruthless submarine warfare and that only overt acts on her part would convince him that she would do so. There followed a period during which the President waited for such overt acts. German submarine warfare was carried on with great ferocity and Allied and American vessels were sunk. Congress was called in special session on Apr. 2, 1917, and the President made an address in which he summarized the offenses of Germany against the United States government and recommended that Congress declare that the course of the German government was nothing less than war against the Government and people of the United States. A resolution declaring the existence of a state of war was passed by both Houses and signed by the President on April 6.

The Mexican Note.—Fuel was added to the rising anti-German feeling in the country by the

publication, on March 1, on the authority of Secretary of State Lansing, of a note from Germany to Mexico inviting Mexico to attack the United States and hinting at aid from Japan. Japan hastened to affirm that she had absolutely nothing to do with the affair.

Participation by the United States in the War. Prompt action followed President Wilson's signature to the war resolution. Orders were issued by the Navy Department for the mobilization of the fleet, and the Naval Reserve was called to the colors. The Navy at once proceeded to seize all radio stations. All German and Austrian vessels in the harbors of the country and its possessions were seized. There were 91 vessels, aggregating a gross tonnage of 630,000. On April 15, the President issued "a call to service" in which he appealed especially to the agricultural and industrial workers of the country to devote their utmost efforts to providing and equipping the armies in Europe.

War Preparations by the Army and Navy.—On March 25, an executive order was issued, increasing the enlisted personnel of the Navy to 87,000 men; on March 26, another order was issued, to increase the Marine Corps to 17,400 men. Immediately after the declaration of war, the Naval Militia, Naval Reserve, and the Coast Guard passed under the control of the Navy Department. The War Department prepared to establish training camps, with a capacity of 25,000 men each, throughout the country.

Council of National Defense.—The economic direction of the war was put in the hands of the Council for National Defense, which consisted of the members of the President's cabinet and a civilian advisory committee made up of business men and leaders of industry. Numerous boards were appointed, consisting of groups of experts. The Food Board was placed in the charge of Herbert C. Hoover (q.v.), executive head of the Belgian Relief Commission. This board was to take such measures as would conserve the food supplies of the United States, and at the same time, as far as possible, it was to supply the needs of the Allies. In November, 1917, it held a "conservation" week, and thousands of families received conservation display cards showing that they would observe "wheatless and meatless" days to aid the Government. A committee of five was appointed to direct the operations of American railways, which were taken over by the Government on Dec. 28, 1917 (see **RAILROADS**). A General Munitions Board had charge of supplying munitions and equipment to the Army. This board was later superseded by the War Industries Board. The Economy Board was organized to take care of the commercial interests of the country and to purchase raw materials for the Government. The Medical Board was formed by many prominent physicians to mobilize and organize the medical men and resources of the country. The Federal Shipping Board was designed to defeat the submarine by building a vast fleet to transport the American Army and great quantities of supplies to Europe. It was organized as a \$50,000,000 corporation, with Colonel Goethals as general manager. The efficiency of this board was marred by continual wranglings over the nature of the vessels to be built. Another important board was the Aircraft Board. Congress appropriated \$640,000,000 for the aerial service and everyone confidently expected that America would take the lead in supplying machines of all types. In September,

1917, a glowing account of the new Liberty motor was given to the public. It was a false hope, however, and it was many months before the engine was perfect; as a matter of fact, virtually all the machines used at the front were of foreign make. See **AERONAUTICS**. Congress made strenuous efforts to prosecute the War effectively. Sums of money undreamed of before were appropriated and many all-embracing war measures, such as the Daylight Saving Law, Espionage Act, Food Act, Fuel Act, Selective Draft Act, etc., were enacted.

Enemy Aliens.—At the outbreak of the War, there were approximately 5,000,000 enemy aliens in the United States. Owing to the activities of many German sympathizers, President Wilson in November, 1917, ordered all enemy aliens to register and gave the Attorney General power to establish forbidden zones. An enemy-property custodian was appointed by President Wilson, with the purpose of seizing all property held by enemy aliens in the United States and of holding it in trust until the close of the War. As each enemy-owned enterprise was seized, an effort was made to convert its products to the use of the Government in the War. More than \$700,000,000 of enemy property was taken over by the custodian.

The Draft Act.—In the President's message to Congress on Apr. 2, 1917, he submitted the project of raising a national Army by conscription. There was tremendous opposition to this, but after a month's debate, the President's idea prevailed, and on May 18, 1917, the Selective Conscription Act was passed. June 5 was set aside as the day on which all males who had reached their twenty-first but not their thirty-first birthdays were to register for military service, 9,659,382 men registered, aliens included. The law authorized the President to appoint a local exemption board for each county and one for each 30,000 population in cities of 30,000 or more. The exemption boards were to be made up of civilians only. Those specifically exempted by the law were Federal and State officials and members of religious sects who had conscientious scruples against the War. The President was authorized to exempt "persons engaged in industries, including agriculture, found to be necessary to the maintenance of the military establishments or the effective operation of military forces or . . . the national interest during the emergency." The cards of registrants were numbered in a red-ink serial up to the total number in the district. Alphabetical arrangements were forbidden. Then the numbers were drawn at Washington and the men were called according to the drawing, which took place on July 20. The men were medically examined and those who were physically fit and not exempted were sent to some one of the 16 military cantonments constructed for the training of new recruits; 687,000 were called in this first draft. After this draft was completed, the system of selection was changed (November, 1917). All the remaining registrants were divided into five classes, according to liability for military service. Those in the first class were to be called first, those in the second next, and so on. During 1918, three registration days were set aside on which the various classes of men were to register. What virtually amounted to a second selective draft act was approved by President Wilson on Aug. 31, 1918. It provided for the registration of all males between the ages of 18 and 45, with

the exception of those who had already registered or who were in the military or naval service of the United States. Approximately 13,000,000 registered on Sept. 12, 1918. See **ARMIES**; **MENTAL MEASUREMENT**.

Financing the War.—Five loans were floated during the course of the War. The first four were called Liberty Loans and the fifth the Victory Loan. The First Liberty Loan books were opened May 14, 1917, and closed June 15. Two billion dollars' worth of 3½ per cent convertible gold bonds were offered. More than 4,000,000 people bought bonds and the offer was oversubscribed by more than 50 per cent, necessitating a pro-rata arrangement for all those who had purchased more than \$10,000. A second loan of \$3,000,000,000 was offered Oct. 1, 1917, bearing 4 per cent interest. Ten million persons offered \$4,617,532,300. The Treasury accepted half of the excess. The Third Liberty Loan was offered on Apr. 6, 1918. It called for \$3,000,000,000 at 4½ per cent. More than 18,000,000 persons offered \$4,176,516,850. The Fourth Liberty Loan called for \$6,000,000,000 at 4¼ per cent. More than 21,000,000 subscribers offered \$6,989,047,000. The fifth, or Victory, Loan called for \$4,500,000,000, and the rate of interest was fixed at 4¼ per cent. More than 12,000,000 people subscribed \$5,249,908,300. For the tax measures passed to help finance the War, see **TAXATION IN THE UNITED STATES AND FINANCE AND BANKING**.

Relations with Austria-Hungary.—Although Austria-Hungary severed diplomatic relations after the break with Germany, the United States did not immediately declare war. Partly as an aid to Italian morale, war was declared on Dec. 7, 1917. Among the reasons given by President Wilson were the sinking of American vessels by Austrian submarines and the unneutral actions of Dumba, the Austrian Ambassador. See **AUSTRIA-HUNGARY**, under *History*.

Peace and After. On Nov 18, 1918, President Wilson announced that he would attend the Paris Peace Conference in person. He named as peace delegates Robert Lansing, Secretary of State, Henry White, a Republican, formerly Ambassador to France, Edward M. House, and Gen. Tasker H. Bliss (q.v.). The President was received in Paris with great enthusiasm and prior to the meeting of the Peace Conference he made visits to Great Britain and Italy, where he was hailed as the savior of the world. President Wilson and his party had received a considerable political setback in the elections held in the United States just six days prior to the signing of the Armistice. Despite a personal appeal by the President to return a Democratic majority, the Republicans carried both Houses of Congress and were successful in a majority of the State elections. The President's chief concern at the Peace Conference was the preparation of the Covenant of the League of Nations and he gave his utmost efforts to this object. After the first draft of the Covenant had been prepared, he returned to the United States on Feb. 24, 1919, for a brief visit. There had already developed in Congress, especially in the Senate, a pronounced opposition to the terms of the Covenant. This opposition was chiefly centred on Article X, which pledged the signatory powers "to preserve as against external aggression the territory of all the States in the League." President Wilson, during his stay in the United States, made several addresses in which he defended the

Covenant. He then returned to Paris. When the Treaty of Versailles was signed on June 28, 1919, the President at once returned to the United States. For a complete discussion of the Peace Conference and the various treaties which followed the War, see **PEACE CONFERENCE AND TREATIES**. See also **LEAGUE OF NATIONS**. For the controversy over what Germany should pay, see **REPARATIONS**.

Political interest in the United States centred in the deliberations on the peace treaty in the Senate. The only effective interruption in the controversy was the passage of the Esch-Cummins Bill providing for the return of the railroads to private operation and management (see **RAILROADS**). The Senate Committee on Foreign Relations having considered the treaty, it was introduced in the Senate on Sept. 28, 1918. There had been added 38 amendments and 4 reservations. The first of these gave the United States the right to withdraw from the League of Nations after due notice had been given. The second freed the United States from any obligations to carry out Article X, noted above. The third reservation provided that the United States should have the power to decide what questions came within domestic jurisdiction. In the fourth reservation, the United States declined to submit for arbitration and inquiry any questions dependent on or relating to the Monroe Doctrine. The President had previously, on the advice of ex-President Taft and others, inserted in the League Covenant a declaration that the Monroe Doctrine continued to be in force. In the face of the outspoken hostility of the Senate, President Wilson determined to appeal directly to the people in behalf of the League. Consequently, he started on a nation-wide speaking tour on September 3. On September 26, he was laid low by an apoplectic stroke which terminated his activity, outside of a few official acts.

After a long debate in the Senate in which much bitterness developed and 14 revised amendments were introduced, the treaty with the Lodge reservations was defeated by a vote of 55 to 39 on November 19. The treaty was reintroduced in the next session of Congress and was again decisively defeated by a vote of 49 to 35. On Apr. 30, 1920, Senator Knox introduced in the Senate a resolution providing for a declaration of peace with Germany. This resolution was adopted by both Houses but was vetoed by the President. In the debate in the Senate, the leaders of the fight for ratification were Senators Swanson of Virginia and Hitchcock of Nebraska. The chief opponents of the ratification were Lodge of Massachusetts, Borah of Idaho, and Johnson of California. Robert Lansing (q.v.), Secretary of State, resigned on Feb. 13, 1920, as a result of severe criticism by the President of his action in summoning the cabinet in session during the illness of the President. He was succeeded by Bainbridge Colby (q.v.).

Election of 1920. The Republican candidates for the nomination prior to the convention were Gen. Leonard Wood, Governor Lowden of Illinois, Senator Hiram Johnson of California, and Herbert Hoover. The leading Democratic candidates were William G. McAdoo and Gov. James M. Cox of Ohio. The Republican National Convention met in Chicago on June 8. The forces of General Wood and Governor Lowden were evenly matched, but both were made unavailable by the disclosures of huge campaign funds which were injudiciously spent in some

cases. On June 12, Senator Warren G. Harding (q.v.) was nominated for the Presidency, and Calvin C. Coolidge (q.v.) was selected as vice-presidential candidate. At the Democratic convention which met at San Francisco on June 28, Governor Cox (q.v.) was nominated for President and Franklin D. Roosevelt (q.v.), as his running-mate. The campaign which followed was exceedingly aggressive, especially on the side of Cox, who, touring the country, made speeches in defense of the League of Nations in practically every State. Senator Harding remained at home, where from day to day he addressed delegations. The Republicans for the most part ignored the League of Nations and directed their attacks against the administration of the President. In the election in November, Harding and Coolidge received 16,181,289 popular votes, against 9,141,753 for Cox and Roosevelt. The electoral vote was 404 to 127. The Nineteenth Amendment, providing for woman suffrage (q.v.), had been adopted prior to the election and the women for the first time participated in the election of a president. This caused an increased popular vote to be cast.

Administration of Harding and Coolidge. President Harding was inaugurated on Mar. 4, 1921. He at once announced the members of his cabinet as follows. Secretary of State, Charles E. Hughes, of New York; Secretary of the Treasury, Andrew W. Mellon, of Pennsylvania; Secretary of War, John W. Weeks, of Massachusetts; Secretary of the Navy, Edwin C. Denby, of Michigan; Secretary of the Interior, Albert B. Fall, of New Mexico; Postmaster General, Will H. Hays, of Indiana; Attorney General, Harry M. Daugherty, of Ohio; Secretary of Agriculture, Henry C. Wallace, of Iowa; Secretary of Commerce, Herbert Hoover, of California; and Secretary of Labor, James J. Davis, of Pennsylvania. On March 23, the President issued a call for a special session of the new Sixty-seventh Congress, for May 11, 1921. Congress at once took up the consideration of measures looking toward economic and financial reconstruction. The Immigration Bill, which limited the immigrants of any nationality during the fiscal year to 3 per cent of the number of that nationality in the United States at the Census of 1910, was passed. For further details and later changes in the immigration law, see **IMMIGRATION**. The Emergency Tariff Bill was passed and approved by the President on May 27. For the provisions of this measure and the subsequent Fordney-McCumber Act, see **TARIFF IN THE UNITED STATES**. A budget law also was enacted. (See **FINANCE AND BANKING**.) The appropriations for the Army and Navy were radically cut down, and by the terms of the Army Bill, the Army was limited to 150,000. See **ARMIES**. For changes in the tax laws, see **TAXATION IN THE UNITED STATES**.

Washington Conference.—The details of the disarmament agreement and the settlement of the problems of the Pacific will be found under the title, **WASHINGTON CONFERENCE**.

Industrial Unrest.—The latter half of 1922 and part of 1923 formed a period of industrial unrest. A general strike of the coal miners, threatening for months in both the anthracite and bituminous fields, was declared in the bituminous fields on Apr. 1, 1922, at the expiration of the two-year contracts between the miners and the operators. Work ceased in the anthracite mines a few months later. Serious disorders

were prevalent. The situation was the subject of remedial legislation in Congress. (See COAL; STRIKES AND LOCKOUTS.) No less serious than the coal strike was a general strike of the shopmen in all the railroads of the country which was declared on July 1, 1923. See RAILROADS; STRIKES AND LOCKOUTS.

Peace with Germany.—On Apr. 30, 1921, the Senate passed a measure which, previously offered by Senator Knox, declared the War between the United States and the Central Powers at an end, and repealed the declaration of war. This was followed by the preparation and ratification of a peace treaty with Germany. By the terms of this treaty, the United States is not bound by any of the provisions of the Versailles Treaty which relate to the League of Nations. It reserves to the United States whatever favorable concessions are made by Germany to the Allied Powers. The treaty was signed by Germany and the United States on July 2, 1921, and ratifications were exchanged in November of the same year.

Foreign Relations.—During the period, affairs in Europe seemed to go from bad to worse. The foreign policy of the Harding administration was to keep aloof. The American troops were gradually withdrawn from Europe and when France and Belgium, in January, 1923, seized the Ruhr (q.v.), the remaining American troops were withdrawn from the occupied zone. The question of the debt owed by foreign countries to the United States was vexatious. There was much propaganda for the canceling of these debts, but the majority opinion seemed to favor their collection. Early in 1923, a British financial mission, headed by Stanley Baldwin, came to the United States and successfully negotiated for the payment of the British debt. (See FINANCE AND BANKING.) On Feb. 24, 1923, President Harding sent the Senate a message asking for participation by the United States in the Permanent Court of International Justice erected at The Hague by the League of Nations. President Harding emphatically stated, however, that he intended no obligations under the League of Nations Covenant.

Coolidge in Office.—In June, 1923, President Harding (q.v.) started on a trip through the West and Alaska. At Seattle, he became very ill and died at San Francisco on August 2. Calvin Coolidge (q.v.) was sworn into office early in the morning of the next day and immediately assumed the presidential duties. In his first message to Congress, Coolidge favored the World Court but opposed the League of Nations; he favored reduction of taxation and opposed the bonus. The League of Nations issue was raised again in November, 1923, when Woodrow Wilson (q.v.) in a radio message deplored the "shameful fact" of the United States' withdrawal from all "responsible part in the administration of peace." This was Wilson's last public address. In January, 1924, he became critically ill and died on February 3.

Scandals and Investigations.—Unfortunately for him, President Coolidge inherited a series of scandals which involved men holding prominent positions. The resignation of Albert B. Fall (q.v.) as Secretary of the Interior was followed by an investigation of the leasing of the oil fields by the Navy and Interior departments. President Coolidge was advised by Attorney General Daugherty to appoint counsel from both parties to investigate and to prose-

cute anyone guilty of irregularities or criminal action in connection with the leases. Consequently, President Coolidge, in a statement made on Jan. 27, 1924, said: "Counsel will be instructed to prosecute these cases in the court so that, if there is any guilt, the guilty persons will be punished; if there is any civil liability, it will be enforced; if there is any fraud, it will be revealed; and if there are any contracts which are illegal, they will be canceled." The oil scandal arose from the turning over of public oil reserves in California and Wyoming to the E. L. Doheny (q.v.) and H. F. Sinclair (q.v.) interests by Secretary Fall. This had been preceded by a transfer of the control of the oil fields from the Navy Department to the Interior Department. On investigation, it was discovered that Fall had been the recipient of a \$100,000 "loan" from Doheny. His testimony relative to this "loan" was conflicting and unsatisfactory. He and Sinclair were subsequently indicted by a Federal grand jury. Both were convicted in 1929, the former for bribery and the latter for contempt of court. The name of William G. McAdoo was drawn into the controversy when it was shown that his law firm received a large retaining-fee from the oil interests shortly after he resigned from the office of Secretary of the Treasury. This played a prominent part in his failure to receive the Democratic nomination in 1924. Franklin K. Lane was another former cabinet official employed by the oil interests. Senator Pomerene and Mr. Roberts were appointed by President Coolidge as special counsel to investigate and prosecute the oil frauds. Secretaries Denby and Daugherty were compelled to resign. They were succeeded by Curtis D. Wilbur (q.v.) and Harlan Stone (q.v.).

Another amazing and serious scandal arose in connection with the administration of the United States War Veterans' Bureau. A senatorial investigation committee reported that the bureau should be completely reorganized. It had failed miserably to provide for disabled veterans and the efficiency of the bureau had been impaired by corruption, inefficiency, extravagance, political pressure, etc. The former director, Col. Charles R. Forbes, and James Thompson, a contractor, were indicted by a Federal grand jury on charges of bribery and corruption in connection with the award of contracts for building veteran hospitals.

Elections of 1924. The Republican convention met on June 10, 1924, at Cleveland, Ohio. The platform continued the policy of aloofness in foreign affairs, although it approved the World Court idea. It also provided for the collection of foreign debts and continuance of the high protective tariff. The question of the Ku Klux Klan (q.v.) was completely ignored. Calvin Coolidge was nominated on the first ballot for the presidency and Gen. Charles G. Dawes (q.v.) was nominated for the vice presidency. Governor Lowden (q.v.) of Illinois was previously nominated, but refused to run.

The national campaign of 1924 was marked by serious dissension in both the leading parties. Among the Republicans existed a faction disposed to the view that the party had failed to give the farming element fair treatment and that capitalism was reaping undue advantage. Among the Democratic group, the cleavage was between the faction predominant in the large cities of the North and the East, which opposed the prohibition system and the anti-foreign at-

titude of the Ku Klux Klan, and the Southern Democratic faction, which was essentially in favor of the prohibition system and antagonistic to the non-native and non-Protestant element. The rift in the Republican Party was outwardly the more serious, for it led to the withdrawal of Senator Robert M. La Follette, of Wisconsin, a popular leader in the Middle West, endowed with great political acumen and committed to views tending toward radicalism. La Follette declared against the Republican Party and created a third party, bearing the name of Progressive and threatening to renew the Progressive secession that had cost the Republicans the Presidency in 1912. For a time, it seemed likely that La Follette might obtain from the dissatisfied agricultural vote enough electoral support to keep either of the major parties from obtaining a clear electoral majority, and thus might throw the election into the hands of Congress. This failed to occur for two principal reasons—one was the turn for the better in the crop situation of the Northwest during the summer of 1924, which greatly allayed the farm discontent; the other was the dissension among the Democrats. At the Democratic convention, held in New York in June and July, 1924, William G. McAdoo, son-in-law of President Wilson, had the support of the greater part of the Prohibitionist and nativist Democrats, while Governor Alfred E. Smith, of New York, had strong backing from New York and other States with large urban populations. The two elements clashed over a proposal to censure the activities of the Ku Klux Klan. In the nomination balloting, a deadlock was reached, no candidate having anything like the two-thirds majority needed for nomination under the Democratic-convention system. After 103 ballots, the convention finally nominated for President John W. Davis, New York lawyer, who though acceptable as a compromise candidate, had but slight national influence as a political leader. Davis made an active campaign and attacked corruption under the Republican régime; he likewise taxed the Ku Klux Klan with endeavoring to make racial origin or religious belief a test of fitness for public life. He failed, however, to carry his home State of New York, almost essential to a Democratic victory, and gained but 136 electoral votes in 12 States. The La Follette vote, while numerically considerable, was insufficient to carry any State save Wisconsin, so that 382 electoral votes went to Coolidge. The popular vote was: Coolidge, 15,725,016; Davis, 8,386,503; La Follette, 4,822,856.

Second Coolidge Administration. The chief features of the second Coolidge administration (1925-29) were those having to do with, first, the reorganization of international relations on a stable peace basis; second, the liquidation of incumbrances left by the War in the domestic field; third, an economic policy leading to a renewal of prosperity; fourth, the discipline of those who had been concerned in official scandals of the Harding administration; and fifth, the enforcement of prohibition.

Foreign and International Policy. The administration continued to regard the election of 1920 as having settled in the negative the question whether the United States should enter the League of Nations. There remained the question whether the United States should join the group of governments submitting to the jurisdiction of the Permanent Court of International Justice, a body owing its existence to League

action, but having separate existence and authority. President Coolidge recommended adherence to this court in 1925 in his inaugural address and in his message of December 8. On Jan. 27, 1926, the Senate finally adopted a resolution by which it made five reservations as the conditions of adherence. These stipulated non-connection with the League of Nations, a voice for the United States in the election of judges, the right of Congress to determine the United States' contribution to the court's upkeep, liberty of withdrawal from the court's jurisdiction, and the right for the United States to refuse consent to the court's rendering any advisory opinion "touching any dispute or question in which the United States has or claims an interest." This last stipulation proved unacceptable to certain of the governments subscribing to the court. On November 22, President Coolidge apprised the Senate that he did not intend to ask it to modify its position. The matter remained at this impasse until within a few weeks of the end of the Coolidge administration, when in February, 1929, Secretary of State Kellogg issued a note to the court powers, offering to consider a new formula for the American stipulations.

While the United States abstained from direct relations with the League of Nations itself, it participated in certain of the activities with which the League was connected. Among these was a series of meetings of the Preparatory Conference on Disarmament and the conference on the restriction of the opium traffic.

The policy of funding the debts of foreign governments to the United States Treasury into obligations of definite maturity to be repaid in specified installments had been initiated by an agreement with Great Britain in the matter of its debt as early as 1923. A Foreign Debt Funding Commission had been created to negotiate subsequent agreements of this type with the rest of the 14 governments indebted to the United States government, chiefly on account of advances made during and immediately after the War. This commission carried out its work in 1925 and 1926, so that at the end of its existence, in 1927, funding agreements had been negotiated with all debtor governments save one, that of Greece, with which was concluded an agreement in like form somewhat later. The agreement with France was not ratified by that country's Parliament until 1929, but the French government provisionally met the payments as they came due. The administration was criticized at home in some quarters as having exacted terms that, while defensible with regard to the abstract rights of the creditor, nevertheless demanded more than the debtors could find means to pay and, particularly, means to transmit to the United States without upsetting the balance of American trade.

The matter of limitation of naval armament by the chief maritime powers had been settled, as to capital ships, by the Washington Conference of 1922. There remained, however, liberty to the powers to increase as they would their armaments in submarines and in cruisers of not over 10,000 tons. In order to extend the armament limitation, the United States Government invited the other naval powers to a conference in 1927 held at Geneva and attended by representatives of Great Britain and Japan. This conference ended without reaching an agreement, as the American representatives stood against the British demand of a considerable allowance of small cruisers of 7000 tons and under. There followed

in 1928 an effort in the United States to bring about the enactment of a measure for the construction of fifteen 10,000-ton cruisers in 5 years, and this measure was finally passed early in 1929, with the proviso that, in case of the attainment of an international cruiser agreement, the construction work might be halted.

The most noteworthy proceeding of the second Coolidge administration with regard to the firmer establishment of peace was the negotiation in 1928 of the Paris Treaty against war. In its inception, this treaty was in part the idea of the French statesman, Aristide Briand, who in 1927 proposed to the United States a treaty by which the French and United States governments should pledge themselves mutually not to resort to war in the future. Secretary of State Kellogg, after the lapse of some time, took up the idea and expanded it to include all governments. A treaty was accordingly executed at Paris, Aug. 27, 1928, by plenipotentiaries of Germany, Belgium, the United States, France, Great Britain and the British Dominions, Italy, Japan, Poland, and Czechoslovakia, by which the signatories condemned "war as an instrument of national policy" and pledged themselves to seek resolutions of disputes only by pacific means. The treaty contained no sanctions. It was subsequently subscribed by 48 other governments, including Russia.

Domestic Sequels of the War. The matter of disposal of alien-property claims arising from seizure of enemy aliens' property during the period of the War remained unsettled until the enactment of the War Claims Act of Mar 10, 1928. By this act, the United States undertook to meet claims, within certain limits, of former enemy aliens for property seized by the United States during the War. Up to the end of October, 1928, the Mixed Claims Commission administering judgment of claims had passed 4403 awards carrying \$167,019,069. The administration of the Soldiers' Bonus, or Adjusted Service Compensation Act was placed in the hands of the Veterans' Bureau, which reported that up to June 30, 1928, 3,508,549 veterans of the World War had obtained adjudication of claims to the total of \$3,408,643,666. As the adjusted-service certificates for these claims were good for payment only after 20 years or at death and not negotiable, many of the holders sought to borrow on their present worth, and the Veterans' Bureau organized the means of making loans in such cases.

With regard to the merchant fleet left on the hands of the Government at the close of the War, a difficult problem had to be met. It was found impossible to make satisfactory arrangements either to operate the vessels as a government-run industry or to let or sell them at suitable prices to private operators. Operating deficits occurred yearly. Eventually, in 1928, the policy of selling the chief vessels and lines to the best bidders was definitely adopted and early in 1929 the sale of two of the chief government-owned lines was affected. A measure was enacted in 1928 to encourage American privately owned shipping by the offer of increased facilities of credit from a government fund, to help meet shipbuilding costs.

The most conspicuously successful dealing of the Coolidge administration with incumbrances left by the War was in the reduction of the national debt. This was effected largely by Secretary of the Treasury Mellon, who by advanta-

geous refunding operations and purchases of government securities out of yearly Treasury surplus reduced the debt principal at more than the projected rate. Debt retirement averaged about \$500,000,000 a year from ordinary receipts for the fiscal years 1925-28 and about \$230,000,000 yearly in addition from the general fund balance. The outstanding debt at the end of the fiscal year 1928 stood at \$17,604,293,201, as against almost \$25,500,000,000 at the end of the fiscal year 1919.

Economic Policy. Closely related to the liquidation of the encumbrances left by the War was the matter of the administration's general economic policy. In the economic field, it was necessary to face problems of taxation, difficulties occasioned by widespread agricultural depression, troubles in the coal industry incidental to overproduction and an excess of labor, tariff problems, and the widely asserted need to restrict the incoming of immigrants. Revenue acts were passed by Congress in 1926 and in 1928. That of 1926 considerably lightened the burden of the income tax at either end of the range of incomes. It was the contention of the administration that the reduction of an excessive burden placed on very high incomes must have the effect of bringing great private aggregations of capital out from the refuge that they had found in tax-exempt securities. The merit of this contention was borne out by the results both of the Revenue Act of 1924 and of that of 1926. The Treasury met, however, with a serious problem in the matter of demands for the return of income and other taxes that had been illegally collected under the intricate and frequently changing revenue law. The amount of such refunds became so great that in 1928 there arose in Congress a serious demand for an investigation of the subject.

The depression in the farming industry, although less pronounced after 1924, gave rise to repeated political agitations. These had for their chief aim the enactment of a measure to enable the growers of certain staple crops to form an organization that, with the financial aid of the Government, might purchase the surplus supply of such crops, sell it abroad at a possibly considerable loss, and assess the loss eventually on the growers, who would recoup by receiving a higher price for the portion of their crops consumed within the country. This general plan was embodied, with variations of detail, in a series of measures generally known alike as the McNary-Haugen Bill. A bill of this name was passed by Congress in 1927 and vetoed by President Coolidge with strong expressions of disapproval. An altered measure, still carrying, however, the features chiefly objectionable to the President was passed in 1928, and he vetoed this measure also, causing widespread discontent among the farming population of Republican sections of the Middle West.

The Fordney-McCumber Tariff Act of 1922 remained in force throughout the second Coolidge administration; but the feature of this act which placed it in the power of the President to alter tariff rates within limits by executive action, in such a way as to meet disparities in foreign production costs, gave rise to considerable criticism based on the idea that the function was properly a legislative one and that continued uncertainty as to the immediate future of tariff rates tended to depress business. The policy of President Coolidge was to alter rates sparingly and seldom to reduce them in commodities of importance.

There arose difficulties with certain foreign countries by reason of the provision made in the act for inquisitions into the business of producers abroad, designed to elicit information as to their production costs. In 1927 the French government put into force a tariff unfavorable to certain importations from the United States and, upon protest from the United States, offered a counter-demand for more favorable tariff treatment to be accorded to importations from France. The disposition of this dispute was put off throughout 1928, France having provisionally suspended its tariff increase in the expectation of reciprocal concessions.

With regard to the difficulties in the coal industry, which led to a series of labor troubles, 1927-28, the administration held firmly to a policy of hands off. As an outcome of the coal strike, temporarily composed in 1927 but resumed in 1928, bituminous-coal labor unions had to give up the hope of maintaining a solid front in their wage disputes and to resign themselves to making the best terms they could by districts. There resulted in western Pennsylvania and eastern Ohio a return to the open shop, with considerable unemployment. Congress took some steps in the direction of investigating conditions in some of the strike areas, but attempted no major action.

The immigration policy of the second Coolidge administration was largely formed upon the Immigration Act of May 26, 1924, an act having for its effect the reduction of the influx of immigrants from the Eastern Hemisphere, and particularly from those sources which had contributed but slightly to the American stock before 1890. The number of immigrants from Europe declined sharply under the application of this law, thus alleviating the apprehension, particularly strong in labor circles, that a wave of impoverished foreigners would arrive and would depress wage levels. The law, however, proved unenforceable in certain of its provisions, onerous in others, and in some directions inadequate. Congress was forced to take action to extend the date for the application of the provision known as the "national origins" clause, a feature providing that after a certain date, originally July 1, 1927, quotas of immigrants admissible to the country year by year should bear fixed proportion to the number of persons of each "national origin" residing in the Continental United States in 1920. Those having to do with the preparation of quotas on this basis revealed doubt as to whether it could be made to operate. The onerous features of the law were chiefly those operating in such a manner as to separate families some of whose members were in the United States and others of whose members sought unavailingly to come in. Hardships at the points of admittance were reduced by examining intending immigrants in their home countries. Great numbers of immigrants continued to arrive from Canada and Mexico, as the quota law did not apply to New World countries. Through Canada entered an undetermined number, supposedly large, of English-speaking people who had become naturalized Canadians or who had merely made a sojourn in Canada as a halfway point to the United States. A border patrol, started in 1924 and later steadily increased, was maintained against illicit immigration from Canada. An effort was made to stop the daily crossing without restriction of persons from residence in Canada to employ-

ment in the United States, but this was declared by the Supreme Court in 1928 to be in contravention of a treaty with Canada.

Political Corruption and Campaign Squandering. The second Coolidge administration on entering office had on its hands the matter of the allegedly corrupt leases of naval oil-reserve lands made by Secretary of the Interior Fall under the Harding administration, the frauds of Charles R. Forbes, former head of the Veterans' Bureau, and the alleged corrupt dealings of former Attorney General Harry M. Daugherty, of Harding's cabinet, and former Alien Property Custodian, Thomas W. Miller, in the disposal of alien property. The party in power took the part of facing these scandals and subjecting the accused men to investigation and trial. Forbes was convicted of corrupt acts in office and condemned to prison in 1926. Miller was likewise convicted and sent to prison. Daugherty, who was tried with him in the same matter, escaped conviction through a disagreement of the jury. Efforts made at various times to convict Fall and the oil operators, Harry F. Sinclair and Edward L. Doheny, on the charge of conspiring to defraud the United States through corrupt bargaining for the leasing of the Elk Hills and Teapot Dome oil reserves were unsuccessful at first. A jury finally acquitted Sinclair in 1928 in spite of testimony indicating that he had paid Fall several hundred thousand dollars. Later, he was convicted as already stated. Civil suits for the breaking of the Fall leases were more successful. These were carried up to the Supreme Court, which in both cases declared the leases corrupt and canceled them. In accordance with the principle of eliminating any possible suspicion of partisan favor, the President appointed two special counselors to prosecute the oil-lease cases, one of the appointees being Owen J. Roberts, a prominent attorney, and the other, ex-Senator Atlee F. Pomerene, of Ohio, a Democrat of distinction. The investigation of divers features of the activities of the men concerned in the oil leases was carried on by the Senate Lands Committee and continued into 1928. Revelations as to the transactions of the Continental Trading Company, a petroleum resale company in which Sinclair had a hand, brought to view persons not originally implicated in the scandals. Among these was another former member of the Harding cabinet, Will H. Hays, ex-Postmaster General, who had served as chairman of the Republican National Committee. Hays testified that he had received from Sinclair some \$260,000 in Liberty bonds, traced as coming to Sinclair from the Continental Company, and had sought to present some of these to prominent Republicans, in return for their checks, which were to appear as contributions to meet the Republican presidential campaign deficit of 1920. The effect of such an operation was apparently to disguise the source of a contribution actually emanating from Sinclair. Fall was convicted of bribery in October, 1929.

The Senate campaign of 1926 gave rise to expenditure on a gigantic scale by candidates in Pennsylvania and Illinois. There followed an extended investigation by a special Senate committee headed by the Democratic Senator James A. Reed, of Missouri. As a result of this investigation, the Senate in December, 1927, refused to seat Senators-elect Frank L. Smith, Republican, of Illinois, and William S. Vare, Republican, of Pennsylvania.

Latin-American Relations. The administration found itself after 1925, as before, with the problem on its hands of obtaining from the Government of Mexico a satisfactory recognition of the property rights of American petroleum and mine operators in that country. President Calles, after his election in 1924 and the subsequent suppression of a rebellion, stood on the basis of the Carranza constitution, which provided for the virtual expropriation of foreign holders of mineral exploitation rights. There followed a long diplomatic dispute, aggravated by the unofficial publication of falsified documents purporting to show on the one side that American officials had taken an underhand course, and on the other, that the Mexican authorities had corrupted three prominent members of the United States Senate. It was further aggravated by Secretary of State Kellogg's declaration that Mexicans were under Bolshevistic influences and were secretly supporting a rebellion in Nicaragua. Eventually, however, at the end of 1927, a conciliatory spirit prevailed and United States Ambassador Dwight W. Morrow reached an understanding with the Mexican government, by which the operation of Mexican laws was made more favorable to foreign mineral interests.

The situation in Nicaragua in 1926 compelled the renewal of American armed intervention in Nicaragua. The last detail of Marine troops, a legion guard, had retired from Managua in 1925, terminating a stay of 13 years. Two months later, in October, 1925, Chamorro, the defeated Conservative candidate for President, drove out President Solorzano and seized the Government. His act provoked an uprising of the Liberals and there followed a period of civil war. Marines were landed in 1926 to protect American and foreign interests in Nicaragua. There occurred serious encounters between the American forces and insurgent bands. In April, 1927, President Coolidge sent to Nicaragua as his personal representative, Col. Henry L. Stimson. Colonel Stimson arranged an armistice under which both parties were to lay down their arms and abide by the result of an election to be held under United States supervision in November, 1928. Although one of the Liberal leaders, Sandino, refused submission and continued to operate against the Marines, order was generally reestablished in the country and the proposed election was held without disturbance.

Prohibition. There were many public expressions of dissatisfaction, in certain of the States, with the workings of the Federal prohibition system in the second Coolidge administration. In 1926 New York State and likewise Illinois voted by a heavy majority a popular referendum in favor of amending the Volstead Law; and in 1928 Massachusetts and at various times Wisconsin and some other States took analogous action. No attempt occurred, however, on the part either of the administration or of any strong group in Congress, to curtail any feature of the system of Federal enforcement. Conventions were negotiated with Canada, Mexico, and Cuba in 1925 and 1926, by which these countries undertook to cooperate to some extent in restricting shipments from their territories to the United States. Partly by means of this aid and partly by the activity of the Coast Guard service, the ingress of liquor into the United States by sea was greatly diminished. In March, 1927, Congress passed an act separating the prohibition unit from the Bureau of Internal Revenue and

erecting it into an independent bureau of the Treasury Department. This act brought the enforcement agents within the Civil Service system. There followed civil-service examinations, which were too much for the majority of the employees, these failing to pass and being disqualified for their employment. The prohibition question played an important part in the National campaign of 1928.

Elections of 1928. President Coolidge rejected the solicitations of strong elements in the Republican Party in 1927, by issuing the brief and downright announcement: "I do not choose to run for President in 1928." This withdrawal left the field open to Republican aspirants, among whom the chief were Herbert Hoover, Secretary of Commerce; ex-Gov. Frank O. Lowden, of Illinois; Senator Frank B. Willis, of Ohio; and Senator Charles Curtis, of Kansas. Secretary Hoover gained a lead in the State presidential primaries early in 1928. Senator Willis died shortly before the primary in Ohio. The Lowden supporters numbered many followers in some of the agricultural Western States, but the influence of this element was insufficient to prevent the nomination of Hoover. The Republican National Convention, held at Kansas City, Mo., nominated Hoover June 14, on the first ballot, giving him 837 votes, Lowden 74, Curtis 64, and lesser totals for several other nominees. Senator Charles Curtis was nominated for Vice President.

Governor Alfred E. Smith, of New York, gained a predominant position in the Democratic pre-convention proceedings, largely by reason of his favorable record in the course of four terms as Governor of the Empire State. The Democratic National Convention met at Houston, Tex., and on June 28 nominated him on the first ballot. This result, remarkable in the face of the Democratic two-thirds rule, was effected by the action of the Ohio delegation, which first voted for Pomerene but shifted to Smith before the ballot was declared closed. Smith's vote before this shift was 724½ votes. Joseph T. Robinson, Senator from Arkansas, was nominated for Vice President.

The party platforms were not strikingly opposed. The Republican platform endorsed the Coolidge administration, pledged a continuation of its policies of economy and tax reduction, and promised enforcement of prohibition. The Democratic platform promised "an honest effort to enforce" the Prohibition Amendment, attacked corruption in Republican officialdom under the Harding administration, and proposed further reduction in expenditures and taxation.

The attitude of Mr. Hoover during the campaign was restrained, he expressed himself as in favor of a considerable programme of Federal public works, and promised the dissatisfied farming element that he would call a special session of Congress if elected. He endorsed prohibition as a "noble experiment," which he undertook to support. Governor Smith, on the other hand, conducted a campaign in which his personal views played a dominant part. While undertaking faithfully to enforce prohibition so long as it remained in force, he condemned the existing prohibition system, and proposed a change to allow latitude to such States as might wish it. He strongly controverted a numerous element that attacked him as a member of the Roman Catholic faith, and asserted the right of every citizen to seek office upon his merits, irrespective of religion. He attacked the figures of Secretary

of the Treasury Mellon with regard to reduction in government expenditure under Republican rule. With regard to the agricultural element, he promised to consider all proposals for relief with an open mind and expressed himself as confident that a sound method of relieving the farmers' need could be found; he promised to summon an advisory conference on the subject, immediately after his election, should he win. It was this proposal that drew from Mr. Hoover the counter-proposal to summon a special session of Congress.

The popular vote was extremely large, far exceeding in its total any previously cast. For Hoover, 21,429,109 votes were cast; for Smith, 15,005,497. In spite of the higher totals, the Republican plurality was less than in 1924 or in 1920. The vote was anomalous in that several of the formerly solid Democratic Southern States gave majorities for Hoover, or more properly speaking, against Smith. As a consequence of this secession, Smith carried but four Southern States and but eight States in all—Alabama, Arkansas, Georgia, Louisiana, Massachusetts, Mississippi, Rhode Island, and South Carolina. He lost New York by a narrow margin. The Republicans gained a majority of 17 in the Senate of the Seventy-first Congress and of 87 in the House of Representatives.

Congressional Legislation in 1929. Congress was three times in session in 1929. The final session of the Seventieth Congress was resumed at the opening of the year and continued until March 4, when President Hoover was inaugurated. The Seventy-first Congress, summoned by the incoming President in special session, sat from April 15, except for a Summer recess, until November 22nd. Convening again in December in its first regular session, Congress continued its work to the end of the year.

The closing period of the last session of the old Congress was devoted largely to legislation on matters previously considered but not concluded. There was passed a measure requiring that 15 naval cruisers of 10,000 tons each and one airplane carrier be constructed at an authorized cost of \$274,000,000; the cruisers were to be laid down at the rate of five in each of the three succeeding fiscal years. An effort made by President Coolidge to have it left to the President's discretion to suspend this building programme in case that the interest of an international understanding on naval restriction should demand it was defeated. The apparent intent of Congress in this enactment was that the construction of cruisers should be assigned to navy yards and to private shipyards alternately. But the wording of the bill specified only that the first and every succeeding odd-numbered ship should be constructed in a government navy yard, thus leaving open the possibility that the Administration might at its discretion place the orders for the intervening cruisers in the navy yards as well—a proposal that was agitated later on as a means of reprisal against shipbuilders for alleged lobbying activities.

The Senate ratified on January 15 the Treaty of Paris for the renunciation of war, commonly known as the Kellogg-Briand Peace Pact. The ratifying vote was 85 to 1. There had been previously an effort among a group of the Senators to attach to the ratification some reservatory clause by which the United States might specifically retain its right to use armed force

in support of the Monroe Doctrine and might divest itself of implied obligation to punish a treaty violator. Instead of a reservation on the part of the Senate, there was incorporated in the report of the Committee on Foreign Relations an understanding of its view on the matter. Senator Capper of Kansas, however, introduced on February 10 a Senate resolution providing that the President could by proclamation forbid the commerce in articles of use in war with any nation violating the treaty. This resolution was left for consideration by the succeeding Congress.

A step for the more effectual enforcement of the prohibition laws was taken by the enactment of the Jones Law, a measure raising the maximum penalties for offenders to a fine of \$10,000 and five years of imprisonment. Likewise intended to promote the better enforcement of Prohibition was a measure sponsored by Senator Glass of Virginia, which appropriated \$250,000 for the purpose of an investigation, under the President, of the entire problem of law enforcement, including Federal Prohibition. This measure as enacted left it to the President to create a commission for the purpose of the intended investigation. Cognate legislation was that in the form of measures creating additional Federal judges in certain of the judicial districts, these having been in some cases overwhelmed with cases by reason of the influx of Prohibition prosecutions.

An effort was made in Congress to effect a change in the method that was followed by the Treasury Department in granting refunds of income tax payments where the Treasury took the view that the payment had not been legally due. Senator McKellar of Tennessee offered a bill to require that all claims for refund, credit or abatement on an internal revenue tax, in excess of \$10,000, must go to the Board of Tax Appeals for determination. Secretary Mellon opposed this bill on the ground that the Board of Tax Appeals was already overburdened and more especially on the ground that a tax that could be administered only by resort to litigation would be collected with difficulty. Owing largely to his stand the proposal made no progress. An effort, unsuccessful likewise, was made to postpone the operation of the system of restriction of immigration based on national origins of the existing inhabitants of the country. The Administration view that this system of restriction was not workable inspired the proposal to postpone it, and the House voted for postponement, but the failure of the Senate to act left the national origins clause to go into effect.

Among other measures enacted by the session was a resolution providing for a survey of the route of the projected ship canal through Nicaragua, at the judgment of the President. The shipment of convict-made goods in interstate commerce was restricted by the Hawes-Cooper Bill, which was enacted. The Norbeck-Andresen Bill, likewise enacted, made provision for the conservation of migratory birds by the establishment of bird sanctuaries in all States of the Union, subject to enabling acts on the part of the State legislatures.

One of the most important administrative acts of the last days of the Coolidge administration was the sale by the Shipping Board to a private bidder, P. W. Chapman & Co., of two leading Government-owned steamship lines, the

United States Line and the American Merchant Line. The total price was \$16,300,000. The Senate Commerce Committee gave its assent to the sale.

President Coolidge signed the instrument ratifying the Kellogg-Briand Treaty on January 17. The construction of works in the Niagara River, to improve the scenic effect of Niagara Falls and at the same time to permit the diversion of more water to power purposes, for some time a subject of negotiation with Canada, was provided by an accord signed at Ottawa January 2, by the Prime Minister of Canada and the American Minister.

President Hoover Inaugurated. Herbert Hoover was inaugurated President of the United States on Mar. 4, 1929. His official views as outlined in his inaugural address were in one respect conspicuous, in that they dwelt with chief emphasis on the need of correcting the "disregard and disobedience of law" which was characterized "the most malign of all the dangers" besetting the nation at the moment. The reform and reorganization of the whole system of justice and enforcement was set forth as a requirement not to be delayed. With particular reference to the enforcement of the prohibition laws, the President declared the duty of the citizens to support the laws of the land to be coequal with that of the Government to enforce them. The policy of governmental regulation of private enterprise as the alternative of governmental ownership or operation was affirmed. The belief was expressed that the United States would enter the jurisdiction of the Permanent Court of International Justice by a way that would be found, and the peace of the world was characterized as "interlocked with our own progress and prosperity." It was declared, however, to be the Nation's will that it should not commit itself to engagements such as membership in the League of Nations. The cabinet drafted by the President was as follows: Secretary of State, Henry L. Stimson; Secretary of War, James W. Good (died Nov. 18, 1929); Attorney General, William D. Mitchell; Postmaster General, Walter F. Brown; Secretary of the Navy, Charles Francis Adams; Secretary of the Interior, Ray Lyman Wilbur; Secretary of Agriculture, Arthur M. Hyde; Secretary of Commerce, Robert P. Lamont. Omitting two members retained from the Coolidge cabinet, this list was sent on March 5 to the Senate, convened in a separate short session for the purpose of considering nominations, and was confirmed. The omitted members were Andrew W. Mellon, Secretary of the Treasury, and James J. Davis, Secretary of Labor. Taking an unc customary course, the Administration held that these two, being already incumbents, did not require renomination. In the case of Secretary Mellon, who had bitter opponents in the Senate, the move was later met by an endeavor to investigate the Secretary on the Senate's own initiative, but eventually his retention as Secretary of the Treasury was allowed to stand.

The first major act of President Hoover was to summon Congress to a special session convening on April 15. The proclamation of March 7, calling this session, stated the need of "legislation to effect further agricultural relief and legislation for limited changes in the tariff." Congress convened approximately as made up by virtue of the elections of the previous autumn. A vacancy was left in the Senate by the withdrawal of Curtis of Kansas to assume the office

of Vice President. The place was filled by the nomination of Henry J. Allen, former Governor of Kansas, at the end of April. President Hoover presented to Congress on April 16 a message in which he detailed handicaps of the farming industry and recommended for its relief "an effective tariff upon agricultural products," the further development of waterways and the creation of a Federal Farm Board as an agency for the reorganization of the agricultural marketing system. With regard to tariff matters outside the agricultural schedule the message alluded to "necessity for some limited changes in the schedules and in the administrative clauses of the laws as written in 1922." The President stated his adherence to the principle of the flexible tariff, recommended strengthening the Tariff Commission and mentioned weaknesses in the system of valuation of imported goods. He approved limiting the session to farm and tariff legislation and to a few emergency matters, among which he included the census and reapportionment measure.

Congress did in fact so limit its activities in the special session, but its work was greatly delayed by the inability of the members of the majority party to unite in sufficient numbers on the President's policy. In the case of the Senate, a strong Republican group from the agricultural States created trouble by its stubborn efforts to insert into the farm relief bill and later into the tariff bill a provision for a system of rebates to farm exports, known as the farm export debenture plan. The principle of this plan was that those exporting certain agricultural products should receive, in proportion to the amount of such exports, debentures or evidences of indebtedness of the Government, which the possessors might employ for certain limited purposes, as for tender in payment of tariff dues. The apparent tendency of the plan was to extend to the exporters of these farm products an inducement of value, or, as some called it, a subsidy, without, however, defraying the resulting cost to the Government by appropriation, and without placing any definite limit on its total in any given period. The debenture plan received the support not only of many Republican but of a large number of Democratic senators.

Farm relief by consent of leaders in both houses obtained the right of way over the tariff. The committees on agriculture of the two Houses prepared measures, both of which provided a Federal Farm Board with the financing of crop-stabilizing corporations by means of loans from a revolving fund of several hundred millions of dollars as one of its chief functions. Both committees did away with the scheme of the equalization fee, upon which the McNary-Haugen bills of previous sessions had come to grief. The House committee made no provision for the automatic reimbursement of agriculture for losses on farm exports sold at less than the domestic price; but the Senate committee after some delay declared in favor of the farm debenture as the means for this purpose. The Senate bill as drafted by Senator McNary of Oregon and his associates provided that the Government issue a debenture on each export shipment of specified agricultural products, to the amount of one-half of the tariff on imports of the product in question, and that all such debentures might be redeemed by presentation in payment of import duties. In advance of the introduction of the bill, President Hoover on April 20 wrote Sen-

ator McNary an open letter setting forth ten reasons for which the President regarded the debenture plan as unwise. He characterized it as a direct subsidy from the Treasury, which so far as it brought advantage to the farmer would stimulate overproduction and would upset the basis of farm diversification and that of import tariff rates.

Nevertheless, the bill, with the debenture plan attached, was introduced in the Senate. In the course of a protracted debate on the subject, Senator Norris of Nebraska proposed an amendment designed to check agricultural overproduction, such as debentures might occasion, by providing a sliding scale under which the debentures would become less in value as the quantity of farm exports rose. This amendment the Senate accepted on April 30. Finally, it passed the Senate bill on May 14, by a vote of 54 to 33, all but two of the nays being Administration Republicans and 33 of the ayes being Democrats.

In the meanwhile, the House, on April 25, had passed its own bill, which provided no debentures and which in general followed the ideas of the President. The House vote was 367 to 34, and the ayes included the majority of the Democratic members. By a special rule, the House sent the bills to joint conference committee without direct vote on the Senate measure. A protracted conference ended in the elimination of the debenture clause on June 5. The Senate on June 11 rejected the conference report. This action drew from the President a somewhat sharp published statement that the whole measure was being jeopardized. The Senate then gave in, passing the conference measure three days later. The act was signed April 15; in its final form, it provided a Farm Board of ten members and created for their employment a revolving fund of \$500,000,000, of which the initial \$151,500,000 was shortly afterward appropriated by separate act.

The Census of 1930. Provision for the taking of a census in 1930 and, in the same measure, for the automatic reapportionment of the representation of the States in the House of Representatives, by administrative procedure, was made in an act signed by President Hoover on June 18. The census features of the measure differed from its predecessors in authorizing a census of unemployment, as well as one of agriculture and of irrigation, a proposal to put virtually all of some 100,000 census workers under the Civil Service rules was defeated, but 500 special agents were rendered subject to Civil Service certification. With regard to reapportionment, there took place in the House a struggle over the proposal to amend the method of counting so as to exclude alien inhabitants and disfranchised Negroes as a component of the population totals on which representation was to be based. This proposal found favor with some sections who apprehended otherwise losing representatives to the more rapidly growing States where aliens were present in higher number. The House defeated this proposal by a vote of 271 to 104. The act in its final form required the President to submit to Congress in December computations of apportionment both according to the system of major fractions and to that of equal proportions, and thus made it possible for Congress still to pass an apportionment act later on. In its failure to do so, the membership of the House was to remain at 435.

Tariff Discussions. The enactment of a tariff measure was the feature of the special session of

Congress in which progress was the least rapid. The House Committee on Ways and Means, which had been busy on a tariff measure during the Congress interim, presented its bill on May 7. This bill, instead of meeting the expectation of those who had founded on the President's message an expectation of very limited tariff increase, raised the duties on hundreds of articles. Such commodities as some of the building materials, clothing, certain chemicals, and many metal products were made subject to higher duty. At the same time, the expected increases in agricultural tariffs were made, but agricultural sentiment was largely adverse none the less, holding that the farmers would lose more by the higher duties on goods they must buy than they would gain by higher duties on imports of commodities they themselves produced. The rate on Cuban raw sugar was sharply raised from 1.76 cents a pound to 2.4 cents, in the interest of domestic growers of cane and the sugar beet. Chairman Hawley of the Ways and Means Committee frankly represented the bill, in evident contrast to that sought by the President, as having the greater protection of American labor for one of its major aims. In its administrative features, the bill provided for the transfer of disputes over the basis of valuation of imports from the Customs Court to the Treasury, and for altering the status of the Customs Court to that of a board. The measure was passed by the House with relatively few amendments on May 28.

In the Senate, the tariff progressed less smoothly. At the outset, on the receipt of the bill by the Senate, an effort was made to commit the Upper House to a measure of revision applying to farm products and related schedules alone. A resolution to this purpose, offered by Senator Borah of Idaho, was narrowly defeated on June 17, by 39 against to 38 in favor. Thereupon, facing the prospect of a slow task of tariff framing in Senate committee, the two Houses, by concurrent resolution took recess, the Senate until August 19 and the House of Representatives until September 3. The committee work of revising the House tariff bill was carried on not by the Senate Finance Committee as a whole but by a subcommittee of the majority members. The resulting bill differed widely from the House measure in detail, but as it in many cases raised the proposed duties on non-agricultural products, it also failed to conform with the President's recommendations. The fact that Senator Bingham of Connecticut had employed as an aid in tariff revision one C. L. Eyanson, an employee of the Connecticut Manufacturers' Association, led to a vote of censure of his course being passed by the Senate and to a Senate investigation of lobbyists' activities.

Premier MacDonald's Visit. The most conspicuous occurrence bearing on the foreign relations of the United States in 1929 was the visit of Prime Minister Ramsay MacDonald of Great Britain at Washington, in connection with plans of the United States and Great Britain for a conference on naval restriction. While Prime Minister MacDonald was at Washington, the invitation of the British government, in which it was stated that the Government of the United States concurred, was issued to France, Italy and Japan to attend the proposed conference. In the financial field, the occurrence in October and November, 1929, of a violent collapse in the stock market, led President Hoover in mid-November to undertake emergency measures for the prevention

of the spread of depression to the field of general business.

UNITED STATES MILITARY ACADEMY. A government institution at West Point, N. Y., for the practical and theoretical training of cadets for the military service of the United States, opened in 1802. By act of Congress in May, 1916, the maximum number of cadets permitted to be enrolled in the academy was raised to 1334 by the appointment of one additional cadet from each congressional district, additional cadets from the United States at large, and from the ranks of the enlisted men in the Regular Army and the National Guard who are between the ages of 19 and 22, and have served not less than one year. Under this act, the enrollment reached its highest mark, 1272, in 1928, as compared with 661 in 1914. In the latter year, there were 215 members of the faculty and 108,000 volumes in the library. The academy is a component part of the Regular Army of the United States and is maintained solely by appropriation from the War Department, which in 1928 amounted to \$2,246,587 for salaries and maintenance of public works, and \$861,000 for continuing construction. A plan was adopted in 1916 admitting applicants on certificates from accredited schools and colleges, as well as by examination. This applied to mental qualifications only. The maximum age for admission to the academy was extended in 1920 from 22 to 24 years for men who served in the armed forces of the United States during the World War. A cadet hospital was completed in 1923 and a new schedule of studies went into effect on Jan. 1, 1924, in which year an athletic stadium was dedicated. A combination mess hall, drawing academy, and cadet store were under construction in 1928. The superintendents and commandants since 1914 have been as follows: Col. Clarence P. Townsley, 1914-16; Col. John Biddle, 1916-17; Col. Samuel E. Tillman, 1917-18; Brig. Gen. Douglas MacArthur, 1919-22; Maj. Gen. Fred W. Sladen, 1922-26; Brig. Gen. Merch B. Stewart, 1926-27; Maj. Gen. Edwin B. Winans, 1927-28; Maj. Gen. William R. Smith, since 1928.

UNITED STATES NAVAL ACADEMY. A school for the education and training of naval cadets at Annapolis, Md., founded in 1845. By Act of Congress of Feb. 15, 1916, the number of midshipmen appointed from each congressional district was increased from two to three, an act of Mar. 4, 1917, permitted the Secretary of the Navy to appoint 100 midshipmen from the enlisted force of the Navy; an act of Apr. 25, 1917, increased the number of appointments to four, which was still further increased to five by act of July 11, 1919. On graduation, midshipmen are commissioned as ensigns in the United States Navy, and occasionally to fill vacancies in the Marine Corps and in certain staff corps of the Navy. Forty appointments may be made by the President from among the sons of officers, soldiers, sailors, and marines of the Army, Navy, and Marine Corps who were killed in action or died prior to July 2, 1921, of wounds or injuries received or disease contracted in line of duty during the World War. The regiment of midshipmen in the fall of 1928 numbered 1790; there were 245 members of the faculty of the academy and the library contained 70,000 volumes. Superintendent, Rear Admiral S. S. Robinson, U. S. N.

UNITED STATES OF EUROPE. European federation as a political concept was discussed at intervals during the nineteenth century. In

1898-99 it was revived by William T. Stead, of London, in connection with the Peace Congress at The Hague. The idea had a place in the international peace propaganda of that period, but nowhere won official recognition. Long before the outbreak of the World War, in 1914 it had ceased to have importance even as a Utopian dream.

The rearrangement of boundaries following the Treaty of Versailles tended to intensify nationalistic feeling in the smaller states and to make more remote any attempt at political federation, but at the same time certain economic evils inherent in the European system were more fully exposed to the light and in every country there were those who thought they saw advantages in union. In 1923 Count Richard Coudenhove-Kalergi, a citizen of Czechoslovakia, issued his appeal for a "Pan-Europa." He promised that a federation of the 27 states on the Continent of Europe, excluding Russia, would give its members security from inter-European war, would neutralize the Continent as a whole in the event of any outside conflict, would offer protection against Russian invasion, would hold out a prospect of disarmament, and would insure the ability of the member states to compete industrially in the world's markets.

Like Stead and other earlier writers on the subject of European federation, Count Coudenhove-Kalergi had been impressed by the success of the United States of America in maintaining a union of 48 states, each sovereign in its own sphere, with a powerful centralized government of proscribed sovereignty. Those writers saw that without tariff barriers the 48 states were free to develop their resources as they could not possibly have been if they had grown up into separate nations, like those of Europe. They saw that to the rest of the world the American commonwealth presented an unbroken front, but that from Delaware to Texas each controlled its own affairs and retained its own individuality. American prosperity with such a system was an object lesson that Europeans could not overlook. Obstacles of language, custom, and national and racial prejudice in Europe seemed to dwindle as America's economic triumph grew more distinct.

The new school of Pan-Europa propaganda, which had its seat at Vienna, conceived of the nations as divided into five general groups. The British Empire, Pan-America, Mongolia (China and Japan), the Russian states, and Pan-Europa. Russia was regarded as an Asiatic, rather than a European, power. Furthermore, the fact that Soviet rule is inconsistent with European democracy was thought a disqualification for membership in the federation.

Britain's exclusion seemed to be regretted by some of the advocates of Pan-Europa, but was based on the extension of British interests in other continents. However, much thought was given to an outline of a prospective British-European Entente, embracing the following principles. Compulsory arbitration of disputes, the disarming of European submarine fleets, the most-favored-nation system and a possible customs union, including British Africa, the exchange of British West Africa for Europe's East African colonies, Britain to assume the protection of Europe's Asiatic colonies (the French and Dutch Indies) against attack, Europe to bind herself to ward off outside attack on England and the British Dominions to accord the same rights to European as to English immigrants.

Instances could be cited from Europe's economic experience to show that international trade combines might be made effective. There was the Zollverein, and in post-war years the steel, potash, and wire cartels, involving France, Germany, and other countries, and the enamel-ware combine affecting Germany, Austria, Czechoslovakia, and Poland. These had been highly successful. Whether because of such practical examples, or for less obvious reasons, the Pan-Europa propaganda made headway among statesmen.

One of the first Europeans in office to indorse the movement was President Herriot of France, in October, 1924, and in a notable address on Jan. 29, 1925. In the following year, sufficient interest had been aroused to warrant the assembling of a Congress at Vienna in October. Chancellor Seipel of Austria presided over the gathering, in which 24 European nationalities were represented. Former Chancellor Wirth of Germany, M. Delbos, former French Minister of Education, M. Politis of Greece, and other well-known public men were among the delegates. With the exception of Lithuania, all the continental nations had some part in the proceedings. The German, French, and Polish youth movements were enlisted in the cause; the Austrian Socialists held aloof. In France, besides M. Herriot, the friends of the Pan-Europa project included Briand, Poincaré, Loucheur, and Caillaux; the two great leaders of Czechoslovakia—Masaryk and Benes—were both said to favor it.

In the summer of 1929, the agitation for a federated Europe went into a second phase when Premier Briand of France announced his intention to work, through the League of Nations, for the founding of a "United States of Europe"—an economic federation at first, to be developed politically later. In conversations with the French journalist, Jules Sauerwein, M. Briand spoke of existing conditions in Europe which he thought might be changed for the better by a form of federation such as he advocated. As reported in the *New York Times*, he said:

"Europe is not organized at all. It is in a chaotic state which, when we examine it attentively, is at once shocking and disquieting. In one country, there are 1,200,000 unemployed who live upon the charity of the State. In another, the farmers, who get scarcely 6 or 7 per cent return for their labor, must pay 12 to 15 per cent for loans when they need them. You see small countries which could sell their agricultural produce at a good profit straining themselves to create national industries, while almost impassable tariff barriers rise between them and their neighbors.

"You see regions, such as Austria, which ought to be prosperous, but are living in misery, which is absolutely paradoxical. Austria is admirably situated for serving as a point of transit for merchandise crossing Europe from north to south, and from east to west, which passes normally through Vienna. Moreover, it possesses a banking and commercial machinery that is first-class, and reliable and experienced specialists in commerce.

"If Europe were not cut up into a series of separate compartments, if the goods which are exported and imported were not heavily taxed, if there were a European treasury to supervise money and keep it at a judicious and reasonable rate, do you think the city of Vienna and its 2,000,000 inhabitants would not be able to prosper?

"On the other hand, consider a country such as Italy, which lacks raw materials. In a Europe federated and organized on reasonable principles, Italy would be assured of getting the raw materials she needs without difficulty."

Exponents of Pan-Europa had stressed the idea that political alliances are out of date, that economic solidarity alone can bring about stability. M. Briand, experienced in statecraft, let it appear that he was hopeful of improving existing political machinery, that he did not find it necessary to discard it altogether. He believed that states closely united by common economic interests would find it easy to come to an agreement for creating a police force to serve the group as a whole, thus making separate armament needless.

At Geneva on Sept. 9, 1929, while the Assembly of the League of Nations was in session, M. Briand explained his ideas to the delegates of European nations there present. He was seconded by Dr. Gustav Stresemann of Germany, whose death occurred a few weeks later. Dr. Hjalmar Schacht, president of the Reichsbank, had already pronounced the project economically sound. M. Briand promised to give more definition to his plans and to prepare questionnaires to be submitted to the several governments. The United States of Europe, as envisioned at Geneva, would occupy an area of 1,932,000 square miles with a total population of about 250,000,000.

While M. Briand's conception of a United States of Europe proved alluring to many minds, serious objections to it were soon disclosed. Thus, Salvador de Madariaga of Spain, as a supporter of the League of Nations, was evidently fearful lest the idea of regionalization would be applied to the Council itself, impairing the League's universality; but Senor Madariaga was unwilling to take even the Continent of Europe as the regional basis of union. He believed that "the Atlantic nations, in whichever continent placed, are in closer solidarity than the European nations as such." Moreover, he questioned the logic of attempting to find an economic basis of union while the countries concerned are still without a common political consciousness. "A zollverein will not be the preface, but the epilogue, of union." Besides, a zollverein will give rise to complex problems that can only be adjusted by governmental agencies. He further insists that non-European nations "intimately connected with the European economy" (e.g., the United States of America and Argentina) should be included.

Protests had already been made against the exclusion of Great Britain from the Pan-Europa scheme (notably by the *Journal de Genève*) and in 1926 the English economist, J. A. Hobson, showed that the expected economy of European cartels in various manufactured articles would be greatly restricted if Britain did not come in. Assuming that a continental tariff barrier would be raised to keep British goods out of Europe, British exporters would use pressure to hold their non-European markets against the cartels, and it might drive Britain into a closer relation with the United States of America.

In November, 1929, Dr. Hobson elaborated his views on M. Briand's United States of Europe in the *Contemporary Review*. As a project for a Europe built on the lines of the United States of America, he regards it as chimerical. If, however, it should take shape as an organization for European coöperation in commerce and industry, Dr. Hobson visualizes it as "a stumbling-block

to the genuine progress of free trade and coöperation in the entire world." He thinks that reprisals might be provoked in other countries excluded from their former European markets and he concludes that "a union in which two great European countries, Russia and Britain, were not participants, while another country in intimate cultural, economic, and political relations with the Western European nations, the United States of America, was excluded, cannot be deemed to have a footing in the world of political realities."

Nevertheless, it was everywhere admitted that the services of transportation and communication in Europe depended for efficiency on international coöperation. Since the World War, through-train service in Europe has been improved. Air transport, Señor Madariaga conceded, is international in its nature and calls for coöperative control. Some observers who have not yet been convinced that such a structure as the United States of Europe can be erected with any promise of permanency, were still questioning whether coöperation in a few definite activities of international scope and character may not be immediately practical. By making such an attempt, it might soon be determined how far the lack of "a common political consciousness" among the European nations militates against common social and economic enterprise. Federal control of money, the post, and other functions of national sovereignty, presents additional problems, which are assuredly not to be solved by a superficial analogy with American conditions.

Assuming that a United States of Europe in operation would adopt the bicameral legislative system, following the example set by the United States of America, Prof. Albert Bushnell Hart, of Harvard University, pointed out (in *Current History* for November, 1929) that the number of European states with very small populations would make the problem of representation more difficult than in America. Taking a strict population basis and allowing one representative for every million inhabitants, France would have 41 and Albania 1. If in the upper house of the legislature each state should have one vote, Germany, France, Italy, Poland, and Spain together could be outvoted by a combination of states having a total population of less than 2,000,000 out of Europe's 250,000,000.

Pan-Europa, an interesting discussion by Count R. Coudenhove-Kalergi (in English translation, with an introduction by Nicholas Murray Butler) was published in 1928. Other discussions of this topic are to be found principally in reviews and other publications of current politics and history.

UNITED STATES STEEL CORPORATION.

One of the world's greatest steel manufacturing organizations, incorporated in New Jersey in 1901. It absorbed the Federal Steel, National Tube, American Steel & Wire, National Steel, Lake Superior Consolidated Iron Mines, Union Steel, the Carnegie Company, and other corporations. It owns and operates 3796 miles of railroad. The capital stock outstanding in February, 1929, consisted of \$711,623,500 of common, and, \$360,281,100 of preferred, out of an authorized total of \$753,321,000 and \$400,000,000, respectively. On Apr. 15, 1929, the common stock was increased to \$1,250,000,000. In the same year important infringement suits were settled. General offices, Hoboken, N. J., and 71 Broadway, New York. See TRUSTS.

UNIVERSALISTS. A denomination founded on Universalism, the doctrine or belief that it is

the purpose of God to save every member of the human race from sin through the grace revealed in Jesus Christ. Thus, it is claimed that Universalism is as old as Christianity, while the Universalist denomination is of modern origin and is confined mostly to North America. The denomination dates from the arrival of the Rev. John Murray of London, in Good Luck, N. J., in 1770, and under his ministry spread throughout New York, Pennsylvania, and Massachusetts, and later into the Middle West and South. The ecclesiastical organization of the church is under the jurisdiction of the General Convention, which meets biennially. In polity, the parish or society is independent in the management of its temporal affairs and worship. The different parishes within a State are organized into the State Convention, which meets annually, and these in turn constitute the General Convention. In 1929 the churches were grouped in 28 State conventions and two State conferences. The membership of the denomination decreased from 51,716 (estimated) in 1913 to 50,078 in 1929; the number of churches decreased from 709 to 609; and the number of ministers, including lay licensees, decreased from 702 to 546.

Home missionary work was sponsored by the State Conventions; the Women's National Missionary Association, which confined its efforts largely to North Carolina and Tennessee, the Young People's Christian Union, which supported missionaries in Texas, and the General Sunday School Association, which supported a school for colored children in Suffolk, Va. The total amount expended for home missions in 1926 was \$87,160. In 1919 a drive was launched to re-establish the church more firmly and raise \$1,000,000 to carry on its work. With the receipts from this drive, new mission churches were established in the South and West, new buildings were erected in Japan for church, school, and residence purposes, and a better organization and more perfect supervision of mission work were made possible. By 1926 the Japanese mission, established in 1890, consisted of 8 centres of work and employed 7 American and 5 native missionaries, and a number of teachers and helpers. The educational activities of the denomination included 3 colleges, among them Tufts College at Medford, Mass., 3 academies, and 3 theological schools, with a total registration of 6166, and property valued at \$12,892,008. Between Oct. 1, 1925, and Oct. 1, 1926, scholarships amounting to \$3775 were distributed to students in the theological schools. The Women's National Missionary Association has increased its home and foreign missionary work, and purchased the birthplace of Clara Barton, a loyal Universalist, for use as a shrine and for some form of social-service work.

The General Convention established the department of social welfare on a permanent basis with a full-time director who aided the churches in making the most of their opportunities in this line of work. The Murray Anniversary Crusade was carried on in 1920 in celebration of the one hundred and fifteenth anniversary of the foundation of the denomination, and was continued thereafter under the name of the Christ Crusade. The Universalist Comrades, an organization for men, was established in 1919 to aid the larger projects of the denomination. The 1927 Convention, which was held at Hartford, Conn., went on record as favoring the abolition of capital punishment, and also as favoring the outlawry and

abolition of war, both offensive and defensive. During 1927 the convention commenced the construction of a Universalist National Memorial Church in Washington, D. C., and put in operation a ministers' pension plan.

At the biennial General Convention, held in Washington from Oct. 23 to 27, 1929, the tower of the National Memorial Church was dedicated to the ideal of international justice and world peace and as a grateful tribute to Owen D. Young, a Universalist layman. This convention created a department of religious education and favored conducting a school for religious leadership for ministers and encouraging local churches to conduct discussion classes dealing with the implications and applications of Universalism. Resolutions were adopted indorsing President Hoover's request for stricter law observance and pledging him support in his efforts toward the lessening of the burden and danger of armaments; urging the Senate to adopt the Root formula and to approve the Pan-American Arbitration Treaty; favoring the abolition of capital punishment, and authorizing the appointment of a commission on world-wide free religious fellowship to survey the possibilities of religious fellowship and co-operation between Universalists and liberals in non-Christian fields. The president of the 1929 General Convention was the Rev. Frank D. Adams, D.D., of Detroit, Mich. The headquarters are at 176 Newbury Street, Boston, Mass.

UNIVERSAL LANGUAGE. See INTERNATIONAL LANGUAGE

UNIVERSITIES AND COLLEGES. STATISTICS. The U. S. Bureau of Education in 1929 published the statistics of universities, colleges, and professional schools for the college year 1925-26. The report deals with 975 institutions, of which 154 were under public, and 821 under private, control, with a total of 156 independent professional schools. Including these independent institutions with departments of universities, there were the following schools: theology, 180; law, 136, medicine, 77; dentistry, 43; pharmacy, 67, osteopathy, 5; and veterinary medicine, 12.

Enrollment. The total number of students enrolled in the 975 institutions reporting to the Bureau of Education was 822,895, of which 509,732 were men and 313,163 were women. These totals included 33,185 men and 22,447 women in preparatory departments; 20,159 men and 12,341 women in graduate departments; 92,591 men and 5822 women in professional departments; and 23,211 men and 30,355 women registered as unclassified and special students.

Schools of engineering enrolled 59,314 students; of law, 40,359; medicine, 19,682; theology, 13,655; dentistry, 11,777; pharmacy, 10,815; osteopathy, 1588; and veterinary medicine, 537.

The enrollment in summer schools was 209,454; in winter short courses, 3772; and in extension and correspondence courses, 268,481.

The institutions under public control had 290,893 students, while those under private control had 532,002 students.

Excluding those enrolled in summer schools, short, extension, and correspondence courses, the largest four institutions under public control were: University of California, 18,969 students; University of Minnesota, 13,225; University of Michigan, 10,134; and University of Illinois, 10,073. The largest four institutions under private control were: New York University, 20,383 students; University of Chicago, 14,472; Columbia, 12,527; and University of Pittsburgh, 12,052.

The largest four women's colleges are Hunter, 4401 students; Smith College, 2158; Wellesley College, 1599; and Simmons College, 1531 students. The Carnegie Institute of Technology had an enrollment of 2899; the Massachusetts Institute of Technology, 2813; and the Rensselaer Polytechnic Institute, 1251.

The average annual increase in the number of strictly college students for the six years ending in 1926 was 50,786. Between 1910 and 1920, the average annual increase was 19,600 students; from 1900 to 1910, it was 9900; while from 1890 to 1900, it was approximately 4600. Enrollments in the graduate departments increased 47 per cent from 1920 to 1922; 25 per cent from 1922 to 1924, and 13 per cent from 1924 to 1926.

Professors and Instructors. The total number of professors and instructors in the 975 institutions reporting was 62,224, of which 48,649 were men and 13,575 were women. The 154 institutions under public control employed 20,890 professors and instructors, of whom 16,815 were men and 4075 were women. The institutions under private control employed 41,334, of whom 31,834 were men and 9500 were women. The percentage of increase in faculty members was not so large as that of students. In 1926 the ratio of students to professors was 13.2; in 1924, 12.9; in 1922, 12.4; and in 1920, 12.2.

Income. The total income reported by the 975 institutions was \$479,774,664; this included \$72,374,608 received for endowment. The sources of income was as follows. Student fees, \$101,499,120; room rent and board, \$42,346,924, productive funds, \$49,748,999, appropriations from city or State for increase of plant, \$18,355,836; appropriations by State or city for current expenses, \$81,522,432; from the United States government, \$16,144,147; from private benefactions for current expenses, \$16,396,853; from all other sources, \$51,912,421. Excluding additions to endowments, student fees were 24.9 per cent of all college and university receipts for the year.

Property. In 1926 the total property belonging to these 975 institutions was valued at \$2,334,307,221. The value of grounds was \$225,721,958; buildings, \$911,498,850; libraries, apparatus, furniture, and other equipment, \$219,073,684; productive funds, \$978,012,929.

Degrees. During the college year 1925-26, the universities and colleges conferred a total of 71,529 baccalaureate degrees, of these, 41,106 were earned by men and 30,423, by women. A total of 11,451 graduate degrees were conferred; of these, 1302 were Ph.D. degrees, conferred upon 1115 men and 187 women. A total of 1214 honorary degrees were conferred; of these, 397 were the degree of D.D.; 374, LL.D.; 74, Litt.D.; and 3, Ph.D. Schools of law conferred 7938 first professional degrees; medicine, 4122; pharmacy, 3492; dentistry, 2666; theology, 1357; osteopathy, 393; and veterinary medicine, 123.

Accredited Higher Institutions. In the United States, there is no central agency with authority to accredit or classify institutions of higher learning. There are, however, various bodies which establish standards for the accrediting of institutions and, in certain cases, publish lists of institutions that meet their requirements. The most prominent of these are the following:

American Council on Education.—Committees from this organization have formulated certain standards for colleges, junior colleges, normal schools, and teachers' colleges. These have been accepted by most other organizations.

The Association of American Universities publishes a list of approved colleges and universities. This association accepts in a general way the statement of principles and standards for accrediting colleges developed by the American Council of Education.

The Association of Colleges and Secondary Schools of the Middle States and Maryland makes use of the principles and standards recommended by the Council of Education. It publishes a list of accredited institutions located in its own territory.

The Association of Colleges and Secondary Schools of the Southern States accepts, in general, the recommendations of the American Council on Education and publishes lists of colleges, junior colleges, and teacher-training colleges that meet its requirements. In addition, this association has published a list of colleges whose graduates may be employed as teachers by the accredited secondary schools in the association.

The North Central Association of Colleges and Secondary Schools accepts the recommendation of the American Council on Education and publishes a list of accredited colleges and universities, junior high schools, and teacher-training institutions.

The Northwest Association of Secondary and High Schools accepts the recommendations of the American Council on Education and publishes a list of accredited colleges, junior colleges, and teacher-training institutions located in its territory.

The New England Association of Colleges and Secondary Schools has adopted the minimum requirements for an accepted college of liberal arts. It has no published list of accredited institutions.

The American Association of Junior Colleges has set up no formal requirements for accrediting junior colleges, but it has defined a junior college and has suggested a set of standards which it hopes may serve as a guide to individual institutions and perhaps to accrediting agencies.

The American Association of Teachers' Colleges has adopted standards for accrediting teacher-training institutions. The association made provision for the inspection of teacher-training institutions in the country and proposed to prepare a classification of them based upon the standards adopted.

The Council of Medical Education and Hospitals of the *American Medical Association* has a schedule for grading medical schools. After careful inspection, medical schools are rated on a civil-service basis on a scale of one hundred points. Data relating to each school are grouped under the four general heads: faculty, product, administration and supervision, and buildings and equipment. Each of these groups is allowed a possible 25 points. Medical schools obtaining 70 or above are rated in class A; those obtaining from 50 to 70, in class B; and those obtaining 50 or less, in class C. The association publishes accredited lists.

The Dental Educational Council of America has developed standards for dental schools and publishes a list of class A and class B schools.

The American Association of Colleges of Pharmacy employs its requirements for membership in the association and has in effect a set of standards. It publishes a list of members and associate members.

The American Bar Association has approved a set of resolutions presented to it by its council

on legal education and admission to the bar. It publishes a list of law schools meeting the association standards. The standards adopted by the association are practically the same as those set up for membership by the *Association of the American Law Schools*.

The Council of the American Library Association has adopted minimum standards for junior undergraduate, senior undergraduate, graduate, and advanced graduate, library schools. On the basis of these standards, it publishes a list of accepted institutions.

Educational Boards and Foundations. *American Council on Education.* This organization is the central one in which the great national educational associations and societies are represented. Its general object is to promote and carry out cooperative action in matters of common interest to the association and the institutions composing it. There are three classes of members—constituent, associate, and institutional. The constituent members include 16 national educational associations. Each is represented by three delegates who vote as a unit at meetings of the council. Associate members are educational or scientific organizations having interests related to the work of the council. Each associate member may send one representative to the meetings of the council without the right to vote. There are about the same number of associate as constituent members. Institutional members are colleges, universities, and professional and technical schools contributing not less than \$100 a year to the council. Each may be represented at meetings of the council by two delegates without the right to vote. There are more than two hundred institutional members. The directors' budget for 1926-27 estimated resources of \$105,740.45. Among the projects receiving attention of the various committees of the council are Federal legislation, international educational relations, education for citizenship, and educational standards. Headquarters are in Washington, D. C.

The Carnegie Corporation. The report for the year ending Sept. 30, 1928, showed that the corporation had total funds amounting to \$128,691,443.59; total income for the year, \$7,103,279.58; donations paid during the year, \$5,923,689.25, which included \$50,000 for buildings, \$270,734.67 for library and other buildings for institutions, and \$3,346,666.68 for endowments. The total charges against future income were \$20,418,581.84. The corporation also had a special fund, the income of which is to be used in Canada and the British Colonies. The total amount of this fund was \$13,862,088.90. The income for the year ending Sept. 30, 1928, was \$679,873.16; donations by the corporation, \$209,528.15, of which \$25,000 was given to the Royal Society of Canada. Of the remainder, a considerable portion was given to the furtherance of an African programme. See **CARNEGIE CORPORATION**.

Carnegie Foundation for the Advancement of Teaching. The total resources of this Foundation are \$30,857,000, of which \$15,647,000 was held as permanent general endowment; \$1,351,000, as endowment of the Division of Educational Enquiry; \$12,428,000, as a reserve for liquidating pension liabilities accruing after 1928; \$830,000 to assist colleges and universities to adopt the contributory plan of annuities; and \$601,000, as an emergency reserve. During the year ending June 30, 1927, the total expenditure

from general funds was \$1,403,188.42. Of this sum, \$1,314,419.92 was for retiring allowances. The expenditure for the Division of Educational Enquiry was \$73,394.96. Of this sum, \$22,806.77 was used for a study of college athletics. See CARNEGIE FOUNDATION.

The Teachers Insurance and Annuity Association of America, which was organized in 1918 by the Carnegie Foundation and financed by the Carnegie Corporation, reported that deferred annuity contracts provided by the association had been adopted by 176 institutions. Teachers in 400 other institutions had taken contracts in the association. The number of annuity contracts in force at the end of 1926 was reported as 4542, representing a total annual annuity of \$7,151,070. There were 3715 insurance policies amounting to \$20,448,651. The premium income for 1926 was \$1,982,547. The association had resources of \$9,092,558. See CARNEGIE CORPORATION; CARNEGIE FOUNDATION.

The Commonwealth Fund. For the year closing Sept 30, 1928, the Commonwealth Fund reported assets amounting to \$39,650,994 70; its receipts for the year were \$2,581,066.69 and expenses, \$2,387,449. This organization was chiefly concerned with the following eight programmes: child-health demonstrations, Commonwealth Fund fellowships (by means of which 51 British graduate fellows were supported in American institutions), Austrian health programme, division of publications, division of rural hospitals, legal research, and two for mental hygiene and school guidance (United States and England). For these purposes, the Commonwealth Fund spent a total of \$1,675,191.45.

General Education Board. The General Education Board was founded in 1902. Its assets June 30, 1927, were \$98,353,706 23. The receipts during that year were \$19,664,854 24, which included a balance on June 30, 1926, of \$13,336,767.61. The disbursement for 1927 from income was \$5,460,271 60, leaving a balance on June 30, 1927, of \$14,204,582 64. From the date of the board's foundation in 1902 to June 30, 1927, there had been appropriated from principal funds a total of \$159,965,821.97. Of the amounts appropriated, \$111,549,540 39 had been paid, leaving unpaid a total of \$48,416,281 58. In addition to the above payments, \$195,691 81 had been appropriated and paid, from the income of the Anna T. Jeanes Fund, to rural schools for Negroes.

John Simon Guggenheim Memorial Fellowships. This foundation was established in 1925, with a capital fund of \$3,500,000. It grants fellowships which are "awarded only to young scholars and artists who have given unequivocal evidence of marked gift for research or for creative work, and who are engaged in constructive projects requiring special facilities available abroad." Both men and women are eligible. The stipend is usually \$2500, and is awarded for one year. For the year 1928-29, the awards totaled \$173,000 and were given to 75 candidates, 16 of whom were reappointed in order to enable them to complete studies or projects begun during the previous year.

Institute of International Education. This institute was established in February, 1919, by the Carnegie Endowment for International Peace. The general aim is to develop international good will by means of educational agencies and to act as a clearing house for information and advice for Americans concerning things educational in

foreign countries and for foreigners concerning things educational in the United States. The institute has paid the salary of professors on sabbatical leave who were willing to lecture in foreign universities and have been invited to do so. It also entertains distinguished visitors and educational commissions upon their arrival in the United States. The institute administers exchange fellowships and other foreign-study opportunities. Exchange relations are now maintained with Austria, Czechoslovakia, France, Germany, Hungary, and Switzerland.

Applicants for foreign-study fellowships in these countries must (1) be citizens of the United States or one of its possessions; (2) be graduates of colleges, universities, or professional schools of recognized standing; (3) be of good moral character and intellectual ability and of suitable personal qualifications; (4) present evidence of good health, (5) possess ability to do independent study and research; and (6) have a practical reading, writing, and speaking knowledge of the language of instruction in the particular country.

Opportunities are open to both men and women. Preference in selection is given to candidates under 30 years of age. Scholarship and fellowship holders must have sufficient means of their own to cover travel, vacation, and incidental expenses.

In addition to the opportunities for study in the countries named, the institute administers the American Field Service Fellowships for advanced study in French universities, the Germanistic Society Fellowship for study of German culture, and the scholarship for the Junior Year Abroad. It also arranges for the placement of a number of American men in *postes d'assistant d'Anglais* in French lycées and écoles normales, and cares for the activities of the American University Union.

Rhodes Scholarships. The system of Rhodes Scholarships was created by the will of Cecil Rhodes, who died in 1902. He states their purpose in his will as follows: "I also desire to encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking peoples throughout the world, and to encourage in the students from the United States . . . an attachment to the country from which they have sprung, without, I hope, withdrawing them or their sympathies from the land of their adoption or birth."

Provision is made for supporting at Oxford University, for a period of two years each, about 176 selected scholars. The period may be extended to three years. There is an annual stipend of about \$2000. Rhodes scholars are selected without examination on the basis of their school and college records. The will outlines the basis of selection as scholarship, character, interest in out-of-door sports, interest in one's fellows, and capacity for leadership.

Candidates must be unmarried male citizens of the United States, between the ages of 19 and 25, and must have completed at least two years of college work in that country.

In 1929 each State is entitled to two scholars. The trustees of the Rhodes Trust have prepared a bill to introduce into Parliament to alter the method of selection so as to enable the trustees to end selection by States. This measure does not contemplate changing the number of Rhodes scholarships.

Junior Colleges. Since 1917, 15 different States have passed laws dealing with junior colleges. The report of the U. S. Bureau of Education shows that the number of junior colleges in 1926 was 153, located in 31 States. Of these, 47, enrolling 13,850 students, were under public control and 106, enrolling 22,660 students, were in private institutions. In general, junior colleges had not been prominent in Eastern States. In the statistics for 1925-26, the only New England State that reported was Massachusetts, with 375 students. That same year, New York reported only 127 students. There was none in Pennsylvania, Delaware, or New Jersey.

During 1928, however, two noteworthy institutions were opened in New York State. Columbia University organized the Seth Low Junior College, as a Brooklyn part of the university. The college was designed to care for the first two years of college work, after which the students might enter Columbia College or some of the professional schools.

The Sarah Lawrence College, a new junior college for girls, opened in October, 1928, in Bronxville, New York. The aims of the college have been described as follows: "To graduate women in whom interests have been so stimulated that they will continue as an animating principle throughout life. To graduate women whose experience in group activities has shown them the value of cooperative effort, so that they become either fruitful as leaders or skilled in rendering service under the effective leadership of others. To graduate women who have experienced the value of leisure and whose varied interests insure the profitable use of whatever leisure time shall be theirs." The college was founded by the late William Van Deuser Lawrence in memory of his wife. It opened with 150 students. It is expected that this number will be increased to 250 as soon as dormitory accommodations can be provided.

Limiting College Attendance. The remarkable increase in the number of students enrolled in colleges and universities has led to the consideration of methods for controlling enrollment. Some of the institutions have set arbitrary limits on the number of students they will receive. Naturally, such institutions endeavor to select those who are best qualified to profit by higher education.

Other institutions have relied upon the raising of their entrance requirements to bring about a lessening of students. There has been no attempt to require more college admission units, but rather to seek a higher standard among those who are accepted. In the case of applicants who come from schools having certification privileges, it has been possible to fix requirements so that only the upper 25 per cent will be certified by the school for admission. The difficulty has been that there exists such a wide range of standards among secondary schools that the highest 25 per cent in one school may not be so well qualified for college admission as a much lower 25 per cent would be from some other secondary school having a higher standard.

Another condition that has had the effect of decreasing enrollment has been increased tuition charges. A large number of institutions now have a tuition charge of \$300 a year and there are a few that place it at \$400. The fear has often been expressed that these high tuition charges will prevent the attendance of thoroughly worthy students. To offset this possibil-

ity, many of the institutions provide a generous number of scholarships or student-loan funds.

Most institutions now submit their candidates to a general intelligence test. The results of these tests are not often used in making the selection of students who will be admitted, but they are used to help place the student in such work as will be most profitable to him. There is still a large amount of discussion as to whether such tests are effective. Many institutions are conducting extensive researches in order to determine their validity.

See also EDUCATION IN THE UNITED STATES and articles on the different universities and colleges under their respective heads.

UNRUH, FRITZ VON (1885-). A German dramatist, born at Oramien. His early plays, reflecting the attitude of an ardent pacifist toward militarism, aroused much comment. They included *Offiziere* (1910); *Sturme* (1914), and *Prinz Louis Ferdinand von Preussen* (1914). He also wrote a volume of verse, *Vor der Entscheidung* (1915), a story founded on his experiences at the front, *Opfergang* (1915), translated into French as *L'ardun*; and the plays, *Ein Geschlecht* (1916), *Platz* (1920); and *Rosengarten* (1923), which continue his independent line of thought. His later works are *Buch einer Reise* (1924), *Flügel der Nike* (1925), the plays *Heinrich von Arnim* (1925) and *Bonaparte* (1926). The latter was translated into English in 1928.

UTERMEYER, LOUIS (1885-). An American poet and journalist (see Vol. XXII). The fifth edition of his *Challenge*, which was first published in 1914, appeared in 1920. Among his other productions since 1914 were:—*And Other Poets*, parodies (1916); *These Times* (1916), *Translations from the Poems of Heinrich Heine* (1917); *Including Horace*, translations and parodies (1919); *The New Adam* (1920), *Heavens, a Book of Burlesques* (1922); *Burning Bush* (1928); *Moses*, a novel (1928). He edited *Modern British Poetry* (1920); *Modern American Poetry* (1921); *Poems of Anna Wickham* (1921); *New Songs for New Voices* (1928).

UTERMYER, SAMUEL (1858-). An American lawyer (see Vol. XXII). In 1916 and for several years following, he was a member of the United States section of the International High Commission. He was special adviser to the Government on the interpretation of income tax and war-emergency-tax laws and in 1922 was counsel for a legislative committee investigating the building situation in New York City. He acted as special counsel for the New York Transit Commission in its investigation of the New York City traction lines and in arguing the seven-cent fare case before the United States Supreme Court on appeals.

UPSON, RALPH HAZLETT (1888-). An aeronautical engineer, born in New York City, who started lighter-than-air-machine training for the United States Navy in 1914. He designed the first improved kite balloon in 1915 and developed lighter-than-air construction at Goodyear, principally kite balloons and navy airships (1917). He started the Wingfoot Lake Flying School in 1917 and flew the first navy coast-patrol ship from Chicago to Akron in demonstration flight (1917). He won the National Balloon Race in 1913, 1919, and 1921. During 1918-19 he was a member of the Navy Design Mission in Europe. He wrote many articles on aeronautical subjects. Since 1922 he has been chief engineer

of the Aircraft Development Corporation, and has been a leader in the development of all-metal construction for airships.

URAL AREA. See **SIBERIA**.

URANIUM. See **RADIUM**.

URBAN, JOSEPH (1872-). An Austrian architect and designer of stage settings (see Vol. XXII). He was primarily responsible for the establishment of a new standard of beauty in stage settings in America during and after the World War. A modernist who stopped short of impressionism, he substituted imagination and simplicity in his settings for the prevailing mode of realism in scenic design. Urban was naturalized as an American citizen in 1917. For a time, he was general production manager of the International Film Studio, New York, and created settings for the Metropolitan Opera Company. Later, he added to his interior and stage art work the practice of architecture in New York City and Palm Beach, Fla.

URBAN GOVERNMENT AND POPULATION. See **MUNICIPAL GOVERNMENT**.

URUGUAY, u'rōō-gwā. The smallest of the South American republics, with an area of 72,153 square miles and an estimated population (Dec. 31, 1928,) of 1,807,538. In 1908 the population was 1,042,686. The density increased from 12.9 per square mile in 1908 to 20.4 in 1928. Montevideo, the capital, had 458,633 inhabitants in 1928, as against 291,465 in 1908. Other large cities were Paysandu, 26,000; Salto, 30,000; Mercedes, 23,000. Immigrants, chiefly seasonal agricultural laborers, came from Spain, Italy, Brazil, England, France, and Germany. In 1927 immigrants numbered 202,468 and emigrants, 183,386. The registration during the school year 1927 was 160,169 in the 1464 primary schools, as compared with 91,746 in the 976 schools of 1913. State expenditures on education amounted to 4,981,783 pesos in 1927 (par value of the peso is \$1.034). Vocational training, in particular, is much more general. The University of Montevideo in 1927 had 2230 students.

Industry and Trade. Under the spur of an enlightened government policy, economic activity has shown great advances. A national agricultural college was formed, immigration was officially encouraged, and money was set aside annually, beginning with 1913, to furnish free seed to farmers. The area devoted to agriculture increased from 1,961,515 acres in 1908 to 2,681,613 in 1927. Production of wheat, corn, oats, and linseed, in particular, have shown an increase. Still, 20 per cent of the total imports continue to be food products, and cattle raising remained the leading pursuit, animals and animal products making up 95 per cent of the country's exports. About 60 per cent of the country is devoted to stock raising. In 1925 there were 8,431,613 head of cattle, 597,176 horses, 14,443,000 sheep, 17,500 mules, 18,800 goats, and 251,000 swine. The packing industry was rapidly being developed, and by 1927 upward of 31 plants were devoting themselves to chilling, salting, and canning meats. In 1921 there were altogether 3704 industrial establishments with 36,872 workmen. The state's interest in industrial affairs is evidenced by the passage of a child-labor law, the regulation of hours in industry, the creation of a national insurance bank (1912), an old-age-pension law (1919), etc. The Uruguayan quarries are becoming important, and granite, marble, and agate are being produced and ex-

ported. The foreign trade for the period 1912-29 showed a consistent advance, with a temporary set back in 1920-22, when the world-wide depression affected Uruguay too. Principal imports in 1927, in order of value, were foodstuffs, fuel, hardware, and textiles; principal exports, meat and extracts, wool, hides, agricultural produce, and live animals. Exports and imports in 1918 were valued at \$139,481,000 and \$121,161,000; in 1928, \$104,138,036 and \$96,447,638, respectively. The United States supplied 30.0 per cent of the imports in 1928 and purchased 10.2 per cent of the exports; the United Kingdom, 15.3 and 22.8; Germany, 11.5 and 14.7.

Finance. The estimated receipts and expenditures for the fiscal year 1928-29 totaled 55,066,351 and 57,986,674 pesos, respectively. In 1927-28 actual receipts totaled 59,986,427 pesos and expenditures 55,946,242 pesos. The 1914 receipts were 36,597,360 pesos; expenditures, 36,516,877. Deficits were frequent in recent years, that of 1921-22 being 7,000,000 pesos, and as much in 1922-23. On Dec. 31, 1922, the internal debt was 47,509,387 pesos (15,620,423 in 1913); foreign debt, 128,851,536 (118,487,935 in 1913); total, 178,603,923 pesos. On Dec. 31, 1928, the public debt stood at 213,999,318 pesos, representing a reduction of 5,431,600 pesos during the year. Payments on foreign debts, suspended during the War, were resumed in 1923. Notes in circulation on Oct. 31, 1928, totaled 63,403,766 pesos with a gold reserve of 53,510,020 pesos in all banks.

Communications. In 1928 there were 1757 miles of railway, of which 205 miles were state owned, the remainder was financed by British capital. There were some 700 miles of navigable waterways, largely on the Uruguay and Plate rivers. In 1927, 7684 steamers of 13,525,071 tons entered the ports of Uruguay.

History. The country's prosperity continued unhampered by internal dissension under the administrations of Feliciano Vieira (1915-19) and Baltasar Brum (1919-23). The sympathies of the people were with the Allies in the World War, and on Oct. 6, 1917, following the lead of the United States and Argentina, Uruguay broke relations with Germany. On Mar. 1, 1919, the new federal constitution was put into effect. By the new instrument, the executive power was divided between the President, popularly chosen for four years, who controlled the departments of the Interior, Foreign Affairs, Army and Navy, and a National Administrative Commission of nine popularly elected for six years, which controlled the departments of finance, education and industry, and public works. Minority representation was assured, based on plural voting. Congress retained the legislative power, elected the Supreme Court, passed on treaties, and was vested with the right of interpreting the constitution. Cabinet members might present bills as in England. Church and State were separated, and woman suffrage was provided for, subject to acceptance by a two-thirds majority of each House. Local autonomy was granted the 19 departments, each of which had its local government board and representative assembly. Under Presidents Brum and José Serrato, elected in 1923, progress was made in education and public works, and friendship with the United States was cemented by an increasing number of advanced students sent to American colleges. In December, 1920, United States Secretary of State Bainbridge Colby visited Uruguay.

As a representative of the American Continents, Uruguay was several times elected to a nonpermanent seat on the Council of the League of Nations. Treaties of obligatory arbitration were concluded with Venezuela and Spain. On Mar. 30, 1925, Uruguay signed a treaty with Brazil providing that neither country should permit its inhabitants to take part in internal disorders within the boundaries of the other. On Aug. 25, 1925, the centenary of the founding of the Republic was celebrated with much ceremony.

In 1926 Dr. Juan Campistegui, quite a prominent journalist belonging to the "Colorado" Party, was elected President. He began a four-year term on Mar. 1, 1927. He was the founder of the influential newspaper, *El Día*, and had seen much service with the Government. In November, 1926, diplomatic relations with Cuba were broken off for a short time because of a statement purporting to come from the Uruguayan delegate to the League of Nations to the effect that Cuba's sovereignty was infringed by her relations with the United States. The difficulty, however, was soon satisfactorily adjusted.

UTAH. The tenth State in size (84,990 square miles) and the fortieth in population, capital, Salt Lake City. The population increased from 373,351 in 1910 to 449,396 in 1920, or by 20.4 per cent; estimated population, 1928, 331,000. The white population increased from 366,583 (1910) to 441,901 (1920). The Indians decreased in number from 3123 to 2711. Chinese, from 1305 to 1137, the number of Japanese increased from 2110 to 2956; of Negroes, from 1144 to 1446. The native white population showed an increase from 303,190 to 385,446, while the foreign-born white decreased from 63,393 to 56,455. Both urban and rural populations mounted, the former from 172,934 to 215,584, the latter from 200,417 to 233,812. The growth of the principal cities was as follows: Salt Lake City (q.v.), 92,777 in 1910 to 118,110 in 1920; Ogden, 25,580 to 32,804. Provo, 8925 to 10,303.

Agriculture. Farming made substantial progress in the decade 1910-20 and maintained it thereafter. The number of farms in Utah increased 18.4 per cent, or from 21,676 in 1910 to 25,662 in 1920 and made a farther slight increase to 25,992 in 1925, the total acreage in farms increased from 3,397,699 in 1910, to 5,050,410 in 1920, or by 48.6 per cent, it was 5,000,724 in 1925. The improved land in farms totaled 1,715,380 in 1925. The percentage of the total area used for agricultural purposes was 6.5 in 1910; 9.6 in 1920, 9.5 in 1925. The total value of farm property more than doubled, from \$150,795,201 in 1910 to \$311,274,728, but receded to \$250,317,531 in 1925, the average value per farm was \$69.57 in 1910, \$12.130 in 1920, and \$96.31 in 1925. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 23,013 were operated by owners, 90, by managers; and 2889, by tenants. The comparative figures for 1910 were 19,762; 194, and 1720. White farmers in 1920 numbered 25,248, of whom 21,276 were native, 3972 were foreign born. There were 414 colored farmers, of whom 209 were Indians. In 1910 there were 21,400 white farmers; 15,948 were native, 5452 were foreign born. Farms reported as under mortgage were 9916 in 1920; 10,190 in 1925. The number of dairy cows in 1920 was 80,801; 71,330 in 1925; "beef" cows, 228,953 in 1920;

180,240 in 1925; sheep, 1,691,795 in 1920; 2,355,038 in 1925. The area under irrigation was 999,410 acres in 1909; the irrigated acreage was 1,371,651 in 1919. The estimated production of the principal farm crops in 1928 was as follows: Corn, 522,000 bushels; wheat, 6,861,000; oats, 2,475,000; barley, 1,666,000; potatoes, 3,312,000; hay, 1,500,000 tons; sugar beets, 623,000 short tons. Comparative figures for 1913 are corn, 340,000 bushels; wheat, 6,420,000; oats, 4,140,000; barley, 1,155,000; potatoes, 3,600,000; and hay, 909,000 tons. The apple crop amounted to 350,023 bushels in 1909; to 880,000 in 1928. The production of peaches increased from 143,237 bushels in 1909 to 612,000 in 1928.

Mining. Utah produces large amounts of minerals, among which the chief are coal, silver, lead, and copper, the last named being the most important. The progress of the mining industry is indicated by the table. In the total production of copper, Utah ranks second, being surpassed only by Arizona. In the production of silver, Utah is first among the States. (By the terms

PRODUCTION OF COAL, COPPER, LEAD, AND SILVER IN UTAH

Year	Coal Net tons	Copper Pounds	Lead Pounds	Silver Fine ounces
1914	3,103,036	152,034,002	171,323,137	11,154,916
1915	3,108,715	187,671,188		
1916	3,567,428	240,275,222	201,490,075	13,253,037
1917	4,125,230	246,674,153		
1918	5,136,825	227,169,630	167,008,224	13,455,597
1920	6,005,199	116,931,238	140,838,113	13,106,976
1921	4,078,784	30,891,403	89,187,269	
1926	4,373,793	257,164,182	295,270,000	12,079,755

* Decreased production due chiefly to business depression

of the Pittman Act in 1918, silver was valued at \$1 an ounce.) The State also produces gold to the value of nearly \$4,000,000 a year, as well as zinc, clay, iron ore, and uranium and vanadium ores. In 1928, 38 mines produced 4,842,544 tons of coal, valued at \$12,253,000. The total value of the mineral products in 1926 was \$98,985,218, compared with \$76,536,657 in 1920; \$84,165,525 in 1919, \$105,785,474 in 1918; and \$45,636,198 in 1914.

Manufactures. Although not one of the chief manufacturing States, Utah has industries of great importance, chiefly related to the smelting and refining of metals. There were three cities in the State with more than 10,000 inhabitants in 1920. These contained 35.9 per cent of the total population, and reported 33.8 per cent of the value of Utah's manufactured products in 1919. There were 749 manufacturing establishments in the State in 1909; 1160 in 1919; 517 in 1925; and 556 in 1927. Wage earners in manufacturing numbered 18,868 in 1919; 15,077 in 1925, and 13,585 in 1927. Capital invested amounted to \$52,626,640 in 1909 and \$140,785,034 in 1919. The value of manufactured products amounted to \$61,989,277 in 1909, \$156,933,071 in 1919; \$177,224,538 in 1925; and \$163,118,376 in 1927. The increase in the value of products evidenced in 1919 was due in great measure to altered values incident to the War, and cannot be taken as an index of the increase of manufactures between the years 1914 and 1919. Lead smelting is decidedly the most important industry in point of value, with a production valued at \$13,170,000 in 1909; \$27,518,000 in 1919; \$45,482,711 in 1925, and \$34,513,685 in 1927. The manufacture of beet sugar in 1919 furnished products totaling \$518,000. The canning and preserving industry produced \$10,127,554 in 1925, and \$6,349,806 in 1927. The prin-

cial manufacturing cities are Salt Lake City and Ogden. There were 245 manufacturing establishments in Salt Lake City in 1909, with products valued at \$13,351,000; 415 in 1919, with \$33,357,000; the 1925 products totaled \$32,589,000. There were 68 establishments in Ogden in 1909, with a product valued at \$3713; 110 in 1914, with \$6,014,000; and 128 in 1919, with \$18,150,000.

Education. The educational system of Utah has always been among the best and most efficiently administered State systems. The Legislature has been diligent in passing necessary legislation; in successive legislative sessions, steps were taken toward further improvement. Among the measures affecting recent development is one providing for the appointment of a person to act as State high-school supervisor and also as supervisor of vocational education. While in other States it is common for the director of vocational education to be quite independent of the direction of the high-school supervisor, it is believed in Utah that the single appointment would have a tendency to coordinate the vocational with the regular work of the high school, making all phases of high-school education fit as perfectly as possible into a unified whole.

The Utah Legislature of 1921 made it possible for the State Board of Education to appoint a State primary supervisor, which greatly improved the work of the teachers and the schools. The Legislature of 1917 accepted the provisions of the Federal Smith-Hughes Law, designating the State Board of Education as the State board for vocational education; and, under this law, agricultural, trade, and industrial education, home economics, and teacher training were being carried on with excellent results. The compulsory-education law of the State requires attendance in school until the age of 18, unless the high-school course has been completed. The total enrollment in the public schools of the State in the academic year 1925-26 was 141,788; of this number, 110,695 represented enrollment in the kindergarten and elementary grades and 31,093, the high-school enrollment. Expenditure on the public day schools, 1925-26, was, current, \$8,470,359; outlays, \$1,542,535. The percentage of illiteracy in Utah decreased from 31 in 1910 to 25 in 1920 among the native white population, from 0.7 to 0.5 per cent; among the Negro, it decreased from 5.3 to 5; among the foreign-born, it increased from 59 to 65.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$8,003,287 (of which \$3,712,725 was aid to local education), for interest on debt, \$457,633; for permanent improvements, \$1,974,947; total, \$10,435,867 (of which \$2,645,779 was for highways, \$860,832 being for maintenance and \$1,784,947 for construction). Revenue was \$11,062,291. Of this, property and special taxes formed 51.0 per cent; departmental earnings and charges for officers' services, 7.5 per cent; sales of licenses and taxation of cigarettes and gasoline, 22.1 per cent. Property valuation was \$696,061,566; State taxation thereon, \$5,244,841. Net funded State debt on June 30, 1927, was \$6,594,750.

Political and Other Events. In the elections of 1914, Senator Smoot was a successful candidate for reelection on the Republican ticket. In 1915 the Federal government sent Gen. Hugh

L. Scott to Utah to adjust a situation which threatened to start an uprising of the Piute Indians. Conditions peculiar to an "open range" country were brought to a head by the alleged murder of a Mexican by an Indian and an attempt to arrest the Indian. In 1916 the Democrats elected practically all county officers, the entire State ticket, headed by Simon Bamberger for governor, the two Representatives in Congress, and William H. King as United States Senator. For President, Wilson received 84,025 votes; Hughes, 54,136. In 1920 the Republicans elected Charles R. Mabey governor. Senator Smoot was reelected. In the presidential election, Harding received 81,555 votes; Cox, 56,639. In 1922 Senator King, Democrat, was reelected, although the State generally went Republican and both Republican Congressmen were reelected. George H. Dern, Democrat, was elected governor in 1924 and was reelected in 1928. In 1924 the vote for President was: Coolidge, 77,327; Davis, 47,001; LaFollette, 32,662. In 1928 it was: Hoover, 94,618; Smith, 80,985. The State continued to have one Senator of each party, Smoot, Republican, being reelected in 1926 and King, Democratic, also reelected in 1928.

Legislation. The Legislature of 1915 enacted a State-wide prohibition law; this, however, was vetoed by the governor. A second law was enacted, modeled after the Webb-Kenyon Law and enforcing heavy penalties for its infraction. In 1917 the Legislature created a State budget system and a public-utilities commission, and passed workmen's-compensation, cold-storage, corrupt-practices, and the initiative-and-referendum acts, and it passed also a most stringent State-wide prohibition law, which went into effect in August, 1917.

An amendment providing for constitutional prohibition was proposed by the Legislature and was voted into the constitution in 1919. The Legislature of 1919 passed statutes defining and punishing criminal syndicalism and sabotage and created the State Securities Commission. In 1921 the Legislature passed bills remodeling the State government. In 1923 laws were passed allowing suspension of sentence on the conviction of any crime or offense in which suspension appeared to the court compatible with the public interest, the defendant in such a case to be put on probation. Provisions for city and county budget systems were enacted in 1925. Utah had entered into the seven-State Colorado River compact, and an effort to withdraw her assent to this document failed of achievement in the legislative session of 1927.

UTAH, UNIVERSITY OF. A coeducational State institution of higher education at Salt Lake City, Utah, founded in 1850. The student enrollment increased from 944 in 1914 to 2701 in 1928, the faculty from 80 to 184 members, and the library from 38,757 to 95,319 volumes. The income of the university during the same period was increased from \$250,000 to \$895,489. James McGregor of Terre Haute, Ind., gave \$50,000 in 1918 to endow the School of Mines and Engineering, and in the following year a building for the medical school, a dining hall, Stewart Hall, and an observatory were built. President, George Thomas, Ph.D.

UTICA. A city of New York State. The population increased from 74,419 in 1910 to 94,156 in 1920, to 101,604 in 1925 (State Census), and to 104,200 in 1928 by estimate of the U. S. Bureau of the Census. In 1921 the city built a

conduit for water and a roadway over the abandoned Erie Canal at a cost of approximately \$150,000. The park system of the city also was expanded until in 1928 it embraced more than 600 acres. In 1924 construction of the Marcy division of the Utica State Hospital for the Insane was begun at a cost to the State of more than \$10,000,000. In 1928 a new \$275,000 municipal court and police building was erected. Utica manufactures a third of all the knitted underwear made in the United States, ranks first in New York in the production of cotton cloth,

and is also an important centre for the manufacture of ventilating and heating apparatus, cotton yarn, sheets and pillow cases, and men's clothing. In 1927, 14,175 persons were employed in 191 industrial establishments and received \$16,221,363 in wages, the value of products manufactured was \$70,240,110. Hydroelectric power, which is developed at Trenton Falls, 15 miles north of the city, is distributed to points throughout the Eastern States. The assessed valuation of property in 1927 was \$131,483,000; the net debt was \$8,276,000.

V

VACUUM TUBES. See RADIO TELEGRAPHY

VAIHINGER, vi'hîng-ër, HANS (1852-). A German philosophical critic (see VOL. XXII). He continued his professorship of philosophy and pedagogy at the University of Halle. His later works include *Nietzsche als Philosoph* (1916); *The Philosophy of "As if"* (Eng trans, 1924), *Der Mythos und das Als Ob* (1927).

VAIL, THEODORE NEWTON (1845-1920). An American capitalist (see VOL. XXII). When the telegraph and telephone systems were taken over by the Government in 1918, the Postmaster General appointed him as adviser, and when private operation was resumed in 1919, he was made chairman of the board of directors of the American Telephone and Telegraph Company. He died in Baltimore in 1920, leaving an estate of about \$2,000,000.

VALDEMARAS, AUGUSTINAS (1883-) A Prime Minister of Lithuania. A prominent member of the Nationalist Party and known as a scholar and writer, he was virtual dictator of Lithuania from November, 1926, when he ascended to power through a military *coup d'état*, until September, 1929. During this period, he held both the Premiership and the portfolio for Foreign Affairs. He dealt severely with the Communists, executing a number, and quickly suppressed a popular rising at Tauraggen in September, 1927. His conciliatory attitude toward Poland alienated a section of the army and in October, 1927, he with difficulty survived a cabinet crisis. The ensuing month, following representations from the League of nations, he met Marshal Pilsudski and Foreign Minister Zaleski of Poland at Geneva and ended the technical state of war which had existed between the two countries since 1920. See POLAND and LITHUANIA, under *History*. An attempt was made to assassinate him in the spring of 1929 and further repressive measures were taken against the opposition elements. Notwithstanding these, he was forced to resign the following September.

VALENTINER, va'len-tén'ër, WILHELM REINHOLD (1880-) A German art historian (see VOL. XLII). In Germany at the outbreak of the World War, he enlisted in the army and took part in the entire struggle. On the entry of the United States into the War, he resigned his position as curator of decorative art in the Metropolitan Museum of New York City. Following the War, he frequently visited the United States and became European adviser to the Detroit Museum. He wrote catalogues of important American collections, such as the Johnson and Widener in Philadelphia and that of Henry Goldman in New York (1922). His later works included *Rembrandt van Rijn: Wiederaufgedeckte Gemälde* (Stuttgart, 1921).

VALÉRY, PAUL (AMBROISE) (1871-). A French poet and philosopher who was elected to the French Academy to succeed Anatole France in 1925. A disciple of Mallarmé, laying stress

on the form, sounds, and music of his poems and prose, who was called the poet of the intellectuals. He wrote *Introduction à la méthode de Léonard de Vinci*, whom he admired greatly (1894), and after 23 years of inaction, *La jeune parque*, poems which he called exercises (1917), *La soirée avec M. Teste*, prose (1919); *Album de vers anciens* (1920); *Le Cimetière marin* (1920), *Le Serpent* (1922, tr. 1924), *Charmes* (1922), *Eupalimos; ou, L'architecte*, preceded by *L'âme et la danse*, plays (1923); *Variété*, essays (1924, tr. 1927), *Une conquête méthodique* (1924), and *Poésie*, a discussion of poetics (1928). Consult *Paul Valéry*, by Alfred Thibaudet (1923); *M. Paul Valéry et la tradition poétique française*, by Alfred Druon (1924), and *Paul Valéry, philosophe de la danse*, by André Levinson (1927).

VALETTE, MME ALFRED. See RACHILDE

VALLÉE POUSSIN, CHARLES DE LA (1866-) A Belgian professor of analytical mechanics on the faculty of the University of Louvain. He was a member of the executive committee of the International Research Council and in 1929 was elected a foreign associate of the National Academy of Sciences (American). His works include *Cours d'analyse infinitésimale* (1903-06), and *Leçons sur l'approximation des fonctions d'une variable réelle professées à la Sorbonne* (1919).

VALLE-INCLÁN, RAMÓN DEL (1870-). A Spanish poet and novelist. He is acclaimed by some critics as Spain's most skillful lyricist. In prose, he is an exquisite stylist. Among his most important works are *Las mieles del rosal* (1910), *La media noche: Visión estelar de un momento de guerra* (1917), the novels *Flor de santidad, historia milenaria* (1913); *Sonata de estío: memorias del marqués de Bradomín* (1913); and *Sonata de invierno: memorias del marqués de Bradomín* (1913); and the plays *El embrujado, tragedia de tierra de salnes* (1913); *La marquesa Rosalinda, farsa sentimental y grotesca* (1913), and *Romance de lobos: o, Comedia bárbara* (1915).

VANCOUVER. The metropolis of western Canada and the third city in size in the Dominion. The population in 1928 was estimated to be 250,000. The population of the metropolitan area, including Vancouver, Point Grey, and South Vancouver (which became one civic unit Jan. 1, 1929), North Vancouver, West Vancouver, Burnaby, and New Westminster, was 344,160. Of the estimated 600,000 population for the Province of British Columbia, more than half resided in Greater Vancouver. The city is the most important Canadian port in shipping tonnage. The total foreign trade, including lumber, handled through this port in 1928 amounted to 5,602,000 tons; the trade outward was 4,302,000 tons, the trade inward, 1,300,000 tons. During 1928, 21,806 vessels of 11,644,000 net tons entered the port and 1337 vessels of 4,695,000 net tons were cleared. The port of Vancouver owes its development largely to the growth in grain shipments. A trial shipment of 100,000 bushels in 1917 through the Panama Canal showed that grain

could be shipped through the tropics without deterioration. The commerce in grain grew from practically nil in 1917 to 97,394,934 bushels in 1928. The capacity of the grain elevators in 1928 was 10,400,000 bushels with 13 loading berths. The water frontage of the harbor was 98 miles.

Between 1923 and 1925, a second Narrows Bridge over Burrard Inlet, connecting Vancouver and North Vancouver and carrying both railway and highway traffic, was constructed at a cost of \$1,800,000. In 1928 the City Council of Vancouver approved plans for the construction of a combined vehicle and railroad bridge within the business district to cost approximately \$3,180,000. The plans called for a double-track structure, the upper deck to be used for pedestrian and vehicular traffic and the lower one for a four-track railroad. In 1929 the Canadian Pacific Railway began the elimination of seven grade crossings in the city and rerouted its English Bay branch by constructing a tunnel beneath the downtown streets of Vancouver at a cost of \$1,720,000. The same year, the taxpayers of Vancouver approved a \$5,500,000 municipal-improvement programme which provided for the extension of sewers and water mains, construction of schools and buildings, and improvement of streets. Industrial undertakings included the construction of extensions to power plants, gas plants, lighting systems, and street-car tracks at a total cost of \$5,100,000. In 1928, 15,000 persons were employed in 1500 industrial establishments whose capital investment was \$85,000,000. Bank clearings amounted to \$1,110,000,000, and building permits to \$20,000,000. The assessed valuation of property in 1928 was \$232,335,046.

VANDERBILT, CORNELIUS, III (1873-

) An American capitalist, born in New York City, and educated at Yale University. He was a director in many important financial institutions in New York and elsewhere. He was for many years connected with the State Militia of New York and in 1917 was commissioned colonel in command of the 102d United States Engineers, with which regiment he served in France. In 1918 he was commissioned brigadier general in the National Army and later brigadier general in the Officers' Reserve Corps.

VANDERBILT UNIVERSITY. A nonsectarian coeducational institution at Nashville, Tenn., founded in 1873. The student enrollment increased from 1112 in 1914 to 1404 in 1928. The number of members in the faculty likewise increased during the same period from 125 to 180, and the library from 53,000 to 144,000 volumes. Productive funds in 1928 amounted to \$9,000,000, the annual income to approximately \$800,000, and the value of university property to \$5,650,000. In 1918, \$1,000,000 was added to endowment, of which \$725,000 came from the Vanderbilt family and the General Education Board. In 1919 the General Education Board gave \$4,000,000 for the school of medicine, to be followed in 1921 by an additional appropriation of \$1,500,000 from the same source, and a like amount from the Carnegie Corporation. These gifts were for the purpose of building a new medical plant on the main campus of the university and for reorganizing the school of medicine. These buildings were opened in 1925, as were Alumni Memorial Hall and the G. N. Neely Memorial Chapel. Chancellor, James H. Kirkland, Ph.D., D.C.L., LL.D.

VANDERLIP, FRANK ARTHUR (1864-). An American financier and writer (see Vol.

XXIII). During the World War, he was chairman of the War Savings Committee. In 1920 he visited Japan and on his return wrote many articles in regard to Japanese-American relations. Also in 1920, his book, *What Happened to Europe*, appeared. This was followed by *What Next in Europe* (1922). In 1924 he organized the Citizens' Federal Research Bureau to investigate graft in government circles and took out a \$1,000,000 insurance policy on his life in its favor. He received the honorary degree of LL.D. from Princeton in 1919 and was decorated by several European governments.

VAN DOREN, CARL (1885-). An American editor and author, born at Hope, Ill., and educated at the University of Illinois and Columbia University. After several years on the faculty of the University of Illinois, he was appointed instructor in English at Columbia in 1911 and became assistant professor in 1914 and associate in English in 1916. From that year to 1919, he was headmaster of the Brearley School and, from 1919 to 1922, was literary editor of the *Nation*. He was on the staff of the *Century Magazine*, 1922-25. Since 1926 he has been an editor of the Literary Guild of America. Besides editing selections from the works of American writers, he wrote *The Life of Thomas Love Peacock* (1911), *The American Novel* (1921); *Contemporary American Novelists* (1922), *The Rising Critic* (1923), *Many Minds* (1924), *James Branch Cabell* (1925), *Other Provinces* (1925), *American and British Literature Since 1890*, with Mark Van Doren (1925); *The Ninth Wave* (1926).

VAN DOREN, MARK (1891-). An American literary critic. He was born at Hope, Ill. (a younger brother of Carl Van Doren), was graduated at the University of Illinois, and received the Ph.D. degree from Columbia in 1920. He has been assistant professor of English at Columbia and literary editor of the *Nation*. His writings include *Henry David Thoreau—a Critical Study* (1916), *Poetry of John Dryden* (1920); *Spring Thunder and Other Poems* (1924), *American and British Literature since 1890* (with Carl Van Doren, 1925), *Seven P. M. and Other Poems* (1926); *Edwin Arlington Robinson* (1927), and *Now the Sky* (1928).

VAN DYKE, HENRY (1852-). An American author and diplomat (see Vol. XXIII). He resigned his post as United States Minister to the Netherlands and Luxembourg in 1917, and when America entered the World War he served as a chaplain in the Navy. His later books include *Fighting for Peace* (1917), *The Red Flower* (1917), *The Valley of Vision* (1919), *Golden Stars* (1919), *Camp Fires and Guide Posts* (1921), *Companionable Books* (1922), *Six Days of the Week* (1924), *Half-Told Tales* (1925); *The Golden Key* (1926); *Chosen Poems* (1927), *Even Unto Bethlehem* (1928), *The Man Behind the Book* (1929).

VAN DYKE, JOHN CHARLES (1856-). An American art historian (see Vol. XXIII). After 1914 he published a large number of critical handbooks of the great European galleries, with original and stimulating comments on the paintings. His publications include also *American Painting and Its Tradition* (1919); *Grand Canyon of the Colorado* (1920), *The Open Spaces* (1922); and *Rembrandt and His School* (1923). In the last, he endeavors to prove that only about 50 of the thousand pictures which he claims are ascribed to Rembrandt are genuine, the re-

mainder, according to his theory, are by pupils of Rembrandt. For example, of the many Rembrandts in the Metropolitan Museum, New York City, not one is genuine, Van Dyke believes. This book made a great sensation, but its conclusions were not generally accepted. He also wrote *The Meadows* (1926) and *The Rembrandt Drawings and Etchings* (1927).

VAN DYKE, PAUL (1859-). An American historian and university professor (see Vol. XXIII). While continuing in his Princeton professorship of modern European history, Dr. Van Dyke served as secretary of the American University Union at Paris and as lecturer for the Y. M. C. A. during the World War. In 1921-23 he was director of the American University Union in Paris. He has written biographies of *Catherine de Medicis* (1923), *Ignatius Loyola* (1926); and *The Story of France* (1928).

VANE, SUTTON (1888-). An English dramatist. During the World War, he served in Egypt, was shell-shocked, and was invalided home in 1917. After producing several unsuccessful plays, he wrote *Outward Bound* (1923). Its success was instant. The play was produced in London and New York during 1924. His other plays include *Falling Leaves* (1924) and *Overture* (1925).

VANGEON, HENRI-LÉON. See GHÉON, HENRI.

VAN GORDON, CYRENA (1893-). An American dramatic mezzo-soprano, born at Camden, Ohio. After completing her studies under Louise Dotti at the Cincinnati College of Music, she made her début with the Chicago Opera Association as Amneris in *Aida* (Nov. 23, 1913) with such success that she was engaged as a regular member. She then became one of the principal stars of the company. A splendid singer and superb actress, she is equally convincing in German, French, and Italian rôles. Her Wagnerian repertoire is especially varied, including Venus, Ortrud, Brangäne, Erda, Flosshilde, Fricka, and Brunnhilde (*Walküre*). In 1912 she married Dr. Shirley B. Munns.

VAN HOOGSTRAËN, WILLEM (1884-). A Dutch conductor, born at Utrecht. For six years, he studied the violin under Eldering at the Cologne Conservatory, at the same time playing in the Gürzenich Orchestra under such conductors as Steinbach, Nikisch, and Mahler. After further study under O. Sevcik at Prague, he began his career as a virtuoso, making tours of Germany. A most successful début as conductor, in Hamburg, was followed by appearances as guest-conductor in other German cities, in Sweden, and in Holland. From 1914 to 1917, he was conductor of the Städtisches Orchester in Crefeld, where he also formed a trio with his wife, Elly Ney, whom he had married in 1911, and Fritz Reiss (cello). At his American début with the Philharmonic Society (New York, Jan. 2, 1922), in an all-Brahms programme, he made a deep impression, which was even heightened at his second concert two weeks later. As a result, he was engaged to conduct the second half of the society's summer concerts at the Stadium of the College of the City of New York in 1922, when his brilliant performances attracted record audiences. The following summer, as sole conductor of the series, he repeated his triumphs. In the fall of 1923, he appeared as regular conductor of the winter series, succeeding Stransky, and alternating with Meingelberg. In 1925 he became conductor of the Portland (Oreg.) Symphony Orchestra, at the same time retaining his posi-

tion as principal conductor of the summer concerts of the New York Philharmonic Society.

VAN LOON, HENDRIK WILLEM (1882-). An American author and lecturer, born at Rotterdam, Holland, and educated at Cornell, Harvard, and Munich universities. During the revolution in Russia, in 1906, he went to Moscow, St. Petersburg, and Warsaw as war correspondent. He lectured on history at several universities in the United States from 1911 to 1914. When the World War broke out, he went to Belgium and reported the siege of Antwerp for the Associated Press. The Germans expelled him from Belgium in December, 1914. He lectured on modern European history at Cornell during 1915 and 1916 and later held the chair of history at Antioch College (1922-23). He wrote *The Fall of the Dutch Republic* (1913); *The Rise of the Dutch Kingdom* (1915); *The Golden Book of the Dutch Navigators* (1916); *A Short History of Discovery* (1918); *Ancient Man* (1920); *The Story of Mankind* (1921); *The Story of the Bible* (1923); *Tolerance* (1925); *America* (1927); *Peter Stuyvesant and His Times* (1928); *Man, the Miracle Maker* (1928).

VAN PELT, JOHN VREDENBURG (1874-). An American architect, born in New Orleans. He studied art and technical education in Paris and, from 1897 to 1900, was assistant professor of architecture at Cornell University. After several years spent in travel abroad, he was professor of design and dean of the College of Architecture at Cornell (1902-04). After 1904 he practiced in New York. From 1904 to 1913, he was associate director of the Atelier of Columbia University, and from 1914 to 1917, professor of architecture at the University of Pennsylvania. From 1923 to 1927, he was in charge of the Columbia University extension studios in architecture. He received many medals for the excellence of his designs and plans and was the author of *Essentials of Composition as Applied to Art* (1902).

VAN VECHTEN, CARL (1880-). An American author, born at Cedar Rapids, Iowa, and educated at the University of Chicago. He became assistant musical critic of the *New York Times* in 1906 and that newspaper's Paris correspondent in 1908. He edited the programme notes of the Symphony Society of New York (1910-11) and was dramatic critic for the *New York Press* (1913-14). He wrote *Music After the Great War* (1915), *Music and Bad Manners* (1916), *Interpreters and Interpretations* (1917); *The Merry-Go-Round* (1918); *The Music of Spain* (1918); *In the Garret* (1920); *The Tiger in the House* (1920); *Lord of the Housetops* (1921); *Peter Whistle, His Life and Works* (1922); *The Blind Bow-Boy* (1923); *The Tattooed Countess* (1924); *Red* (1925); *Firecrackers* (1925); *Excavations* (1926); *Nigger Heaven* (1926); *Spider Boy* (1928).

VAN VLIET, CORNELIUS (1886-). An American cellist, born at Rotterdam, Holland. At the age of six, he received his first instruction on the piano and the violin from his father. In 1895 he began to study the cello with O. Eberle in Rotterdam and later continued with J. Mossel in Amsterdam. In 1901 he joined the Concertgebouw Orchestra in Amsterdam. In 1903 he was solo cellist of the Leipzig Philharmonic Orchestra; in 1904, of the Prague Philharmonic Orchestra; and in 1905, of the Helsingfors Symphony Orchestra. He also taught in Helsingfors, at the conservatory. From 1905

to 1908, he was solo 'cellist of the Kaim Orchestra in Munich and in 1908-11, of the Royal Opera in Vienna. In 1911 he came to America on a concert tour. From 1912 to 1919, he was solo 'cellist of the Minneapolis Symphony Orchestra and a member of the Minneapolis Trio. He then moved to New York, where from 1921 to 1929, he was solo 'cellist of the Philharmonic Society, jointly with Leo Schulz. In 1919 he formed, with Scipione Guidi (violin) and Clarence Adler (piano), and New York Trio.

VAQUEZ, LOUIS HENRI (1860-). A French physician, known especially in connection with diseases of the heart, circulation, and blood. Several years after his graduation from the University of Paris, he described a new disease of the blood, polycythemia, known also as Vaquez's disease. He became professor of clinical therapeutics, Paris Faculty of Medicine. One of his earliest publications was *Hygiène des Maladies du Cœur*. With the exception of his *Précis de Thérapeutique* (1907), all his major works have been concerned with heart disease. *Les Arythmies* (1911), *Le Cœur et l'Aorte*, on radiology of the heart, in collaboration with Bordet (1913), *Radiologie des Vaisseaux de la Base du Cœur*, also with Bordet (1920), *Maladies du Cœur* (1921), *Appareil Circulatoire*, in collaboration (1922); *Médicaments et médications cardiaques* (1925), and *Les troubles du rythme cardiaque* (with Donzelot, 1926). His work on radiology of the heart also appeared in English translation. Vaquez is editor of the periodical, *Archives des Maladies du Cœur*.

VARIATION. See HEREDITY

VASSAR COLLEGE. A nonsectarian institution for the higher education of women at Poughkeepsie, N. Y., founded in 1861. The student enrollment in 1914 was 1120, as compared with 1155 in 1928, the faculty numbered 121 at the beginning of this period and 152 at the close; the library was increased from 86,000 to 156,000 volumes, and the productive funds of the college reached \$6,884,056 from \$1,655,257. New admission requirements were adopted in 1919 to replace the old method of admission by certificate from approved schools and colleges. The new requirements took the form of comprehensive examinations in four general subjects, as well as a satisfactory school record of the candidate, and could be replaced at will by the old examinations in individual subjects. Alumnae House, a club and meeting place for both educational and social purposes, was opened in 1923. Cushing Hall, a dormitory named in honor of Florence M. Cushing of Boston, Kendrick House, for women members of the Faculty, a nursery school, and the Minnie Cummoek Blodgett Hall of Euthenics, were opened in 1927 and 1928. In the latter year, a new curriculum was adopted which (1) diminishes and limits, ordinarily to the first year, the fixed requirements; (2) helps the student in her first years to find a purpose; (3) helps her to develop her field of major interest. President, Henry Noble McCracken, Ph.D., L.H.D., LL.D.

VATICAN. See ROMAN CATHOLIC CHURCH.

VATICAN CITY. A sovereign state, officially known as the State of Vatican City, established within the city of Rome as the seat of the Papacy under the terms of the political treaty signed between the Italian Government and the Vatican on Feb. 11, 1929, and ratified by the Italian Parliament in May. Vatican City came into existence June 10 with the exchange of rati-

fications. Ruler, Pope Pius XI (Achilles Ratti).

Vatican City has an area of 108.7 acres. It embraces St. Peter's Church and Piazza, the Vatican with its administrative buildings, gardens, and observatory, and adjoining territory mostly in the rear of these establishments. A census in 1929 showed 518 legal subjects, including 389 Italians, 118 Swiss (100 of whom were members of the Swiss Guard), 11 Frenchmen, five Germans, two Spaniards, a Norwegian, an American, an Austrian, a Netherlander, and an Ethiopian. Citizens include all those having permanent residence there and the cardinals residing in Rome.

The State of Vatican City exercises all the prerogatives of a sovereign state, having separate coinage and postal systems and direct telegraphic, telephonic, and wireless communication with other foreign states (see under LATERAN TREATY). Flying machines of Italy and other states are prohibited from passing over the Vatican territory. Vatican City high officials and cardinals are granted diplomatic immunity and the inviolability of the Pope is enforced by the Italian Government. The territory contains a railway station and a track 600 meters long connecting with the Italian State Railways.

Government. Under the fundamental law, which became effective June 10, 1929, all executive, legislative, and judicial powers are vested in "the Supreme Pontiff as sovereign of the State of Vatican City." Some of his powers are delegated to the Governor of Vatican City, the Papal Secretary of State, and others. The Sacred College of Cardinals exercises virtually no authority except in the period between the death of a Pope and the election of his successor. A legislative measure adopted during the interregnum by the cardinals, to be valid, must be ratified by the new Pope.

An appointive court tries civil cases in Vatican City territory. Cases may be appealed to the sacred tribunal of the Rota and, as a final judicial resort, to the Supreme Tribunal Segnatura. A court of one or more judges appointed by the Governor of Vatican City tries all penal cases. The constitution provides also that persons may appeal to the Pope through the Councilor General of State for redress of injuries suffered by reason of administrative acts of Vatican City authorities. The Pope exercises the sole pardoning power. The legal system is based on canon law and pontifical constitutions and rules.

The fundamental law represents a modification of the former governmental system of the Papal Curia in line with its changed status under the Lateran Treaty. With the exception of St. Peter's Piazza, which remains open to the public and under the jurisdiction of the Italian authorities, Vatican City is policed by the Pontifical Gendarmic Corps. The acquisition or sale of goods or foodstuffs within its boundaries is a state monopoly and duties are imposed on goods imported and exported.

The chief officials of Vatican City in 1929 were Commendatore Serafini, the governor, who is assisted by a treasurer and secretary general; Professor Francesco Pacelli, general councilor; Monsignor Pizzardo, secretary of the Congregation of Extraordinary Ecclesiastical Affairs; and Monsignor Antonio Sabatucci, auditor general of apostolic revenues. Other officials of the Roman Curia previous to the Lateran settlement, including Cardinal Gasparri, Secretary of State, retain their posts.

Finances. Treasury officials estimate that the expenditures of the State of Vatican City will slightly exceed those of the Vatican under its former status. With the interest from the indemnity of 750,000,000 lire cash and 1,000,000,000 lire in Italian 5 per cent bonds paid by the Italian Government, surpluses from the Vatican City financial operations are expected to be even greater than before.

In 1928 the Vatican received an income of \$13,500,000 from "Peter's pence," fiscal dues, private offerings, and other sources. Since 1917 the average ordinary expenditures have not exceeded \$1,400,000 (7,000,000 lire) annually, dispensed (in lire) chiefly as follows:

Entertainment of cardinals and diplomats	500,000
Administration of Vatican, Lateran palaces, and Villa Castel Gandolfo	2,500,000
Charities and school subsidies	1,500,000
Presents and extraordinary aid	1,500,000
Miscellaneous	1,000,000

The greatest expense is incurred in connection with the maintenance of the Swiss Guard of 100 members and the gendarmieric of 120. Two volunteer corps, the Noble Guard and the Palatine Guard, bring the total force of the Papal Army to 598 men and officers. There is no public or state debt.

History. The State of Vatican City concluded with Prussia on June 14, 1929, its first treaty with a foreign state other than Italy. On June 25, 1929, the Pope, as sovereign of Vatican City, received the credentials of the Italian Ambassador, Senator Cesare Maria de Vecchi, the first diplomat accredited to the new state. The first arrest was that of a Norwegian subject, Ramstad Margaret Gudum, who was charged with attempting to shoot one of the canons of St. Peter's, Archbishop John Smit, on Nov. 25, 1929. On December 5, King Victor Emmanuel and Queen Elena of Italy paid an official visit to the Pope.

One of the first controversies involving the new state arose when the authorities of the British Crown Colony of Malta refused to issue a passport to a monk ordered to Sicily by the Italian superior of his monastery, on the ground that he was a British subject who was being sent away against his wishes and for political reasons. Cardinal Gasparri addressed a formal protest to Lord Strickland of Sizergh, the British Prime Minister of Malta. The latter's sharp reply, accusing Roman Catholic prelates of Malta of attempting to undermine British authority on the island, led to a discussion of the matter in the British House of Commons. Negotiations for the settlement of the difficulty by treaty were then undertaken.

Opposing views as to the extent of the sovereignty of Vatican City were expressed by Mussolini and the Pope while the Lateran treaties were before the Chamber of Deputies.

On Nov. 4, 1929, the *Osservatore Romano*, official organ of the Vatican, transferred its offices to quarters within the Vatican City. Extensive alterations and improvements on Vatican City property were commenced in 1929. See **LATERAN TREATY, ITALY**, under *History*, and **ROMAN CATHOLIC CHURCH**.

VAUGHN, SAMUEL JESSE (1877-). An American college president, born in Elkton, Mo., and educated at Drury College, Mo., and the University of Chicago. He was director of industrial education at several schools in Illinois until 1921, when he was chosen president of

Hardin College, where he remained six years. Since 1926 he has been president of Colorado Women's College. Since 1914 he has been editor of the *Industrial Arts Magazine*. During the World War, he served in the Sanitary Corps. He is the author of *Content and Methods of the Industrial Arts* (1922). He lectured much on educational, social, and economic problems.

VEATCH, ARTHUR CLIFFORD (1878-). An American geologist, born at Evansville, Ind., and educated at Indiana, Cornell, and Wisconsin universities. He was assistant State geologist of Louisiana (1898-1900). In 1902 he became assistant geologist with the United States Geological Survey and, from 1906 to 1910, held the rank of geologist. He took charge of the foreign petroleum developments of S. Pearson & Sons of London in 1912. During 1919 he became connected with the Sinclair Consolidated Oil Corporation, in charge of the exploration department, at the same time serving as consulting petroleum technologist to the U. S. Bureau of Mines.

VEBLEN, THORSTEIN B. (1857-1929). An American economist (see Vol. XXIII). In 1918 he became a teacher at the New School for Social Research in New York City, retiring in 1927 to devote his time to translations and essay writing. Among his later publications are *An Inquiry into the Nature of Peace and the Terms of Its Perpetuation* (1917); *The Higher Learning in America* (1918); *The Vested Interests* (1919); *The Place of Science in Modern Civilization and Other Papers* (1920); *The Engineer and the Price System* (1921); *Absentee Ownership and Business Enterprise in Recent Times* (1923). He translated *The Laxdala Saga* (1925).

VENETIA JULIA. See **FIUME-ADRIATIC CONTROVERSY**.

VENEZUELA, ven'ê-zwê'la. A republic on the north coast of South America with an estimated area of 393,874 square miles. The census of December, 1926, gave the population as 3,026,878, in 1928 it was estimated at 3,124,421. In 1928 the gain from immigration was only 438. Populations of the important towns in 1926 were: Carácas, the capital, 135,253; Maracaibo, 74,767; Valencia, 36,804; Barquisimeto, 23,109; San Cristobal, 15,295. On Jan. 17, 1929, Cumana, a seaport of 25,000 inhabitants and the oldest city on the South American continent, was partially destroyed by a severe earthquake. After 1913 great administrative activity in the field of education was evident, in 1914 primary education was made free and compulsory; in 1915 vocational and art schools were provided for; in 1916 schools of pharmacy and dentistry were established. At Caracas, the Central University was reopened in 1922 after a lapse of 10 years. In 1927 there were 70,151 pupils registered in the government primary schools, 14,487 in private schools, 9648 in municipal schools, and 9689 in State primary schools.

Industry. Agricultural, pastoral, and woodland products and petroleum are the leading factors in the country's economic life. Coffee is first in importance, with some 500,000 acres under cultivation in 1928 on 33,000 plantations, with an average annual production of 69,000,000 kilos valued at \$30,000,000. The annual production of cocoa is about 20,000 metric tons; of sugar about 60,000. Cattle, sheep, and goat raising remain important, and in the years 1915-22, the herds and flocks showed increases. The annual crop of cotton is about 20,000 bales. Gold, petroleum, copper, salt, and asphalt are the lead-

ing mineral resources. From leases, etc., the Government derived an annual revenue of some 3,400,000 bolívares in royalties. In later years, petroleum was mined in increasing quantities. The oil wells, principally in the Maracaibo district are worked by American and British interests. In 1923 the production of petroleum was 4,201,000 barrels; for the fiscal year 1927-28, this had increased to 107,235,094 barrels, making Venezuela second in the world as an oil producer. Gold production has increased considerably since 1925; 51,472 ounces were mined in 1927. Imports and exports in 1923 were valued at \$17,731,000 and \$28,985,000; similar figures for 1927-28 were \$69,184,577 and \$98,103,683. The large increase was due in a considerable measure to the discovery and exploitation of the oil wells. In 1927 the United States supplied more than 50 per cent of Venezuela's imports (\$36,056,000), and purchased about one-quarter of her total exports.

Finance. In 1914 revenues were 67,414,974 bolívares; expenditures, 72,278,987. In 1928-29 expenditures were 155,450,000 bolívares (\$37,721,850) and revenues 204,345,961 bolívares (\$39,438,770). The budget for 1929-30 calls for revenues of 193,189,750 bolívares and expenditures of 192,450,000 bolívares. In January, 1914, the internal debt amounted to 61,607,179 bolívares. In December, 1923, it had been reduced to 41,603,245 bolívares. Similarly, in 1914 the foreign debt was 114,853,071 bolívares; in 1923, 67,122,880. By August, 1929, the external debt had been reduced to 29,249,417 bolívares (about \$5,600,000). On the same date, the current internal debt of Venezuela amounted to 28,735,884 bolívares, or about the same amount as the foreign debt. On Dec. 31, 1925, the Treasury reserves amounted to 74,000,000 bolívares. In 1925 notes in circulation were 33,600,000 bolívares.

Communications. In 1927, 660 miles of railway were in operation, a gain of 120 miles over 1914. The number of vessels with cargo entering Venezuelan ports in foreign trade in 1926 was 1963 of a capacity of 2,460,000 net registered tons. Clearances of vessels with cargo were 3797 of a capacity of 4,720,000 tons, the marked difference, as compared with entrances, being largely due to the outgoing movement of petroleum. There are 11,160 miles of navigable rivers and lakes, 6244 miles of telegraph line, and 359 post offices.

History. After 1914 internal affairs remained orderly. The chief concerns of the Government were the readjustments necessary to meet war conditions. Venezuela maintained her neutrality throughout the World War and on Mar. 3, 1920, joined the League of Nations. Gen. Juan Vicente Gómez continued as President holding the office uninterrupted since 1909, although for a time he relinquished the post to a provisional President to act as commander-in-chief. In 1922 he was reelected for the next seven years' term. The long-standing boundary dispute with Colombia was, as a result of a convention signed in 1916, first submitted to the Swiss President as arbiter, and then to the Swiss Federal Council. On Mar. 24, 1922, it was announced that a decision had been reached, although the terms were not made public. On June 30, 1923, the first Vice President of the Republic, Juan C. Gómez, brother of the President, was murdered in the palace at Caracas, as a protest against the nepotism practiced by the administration. On the other hand, in justification of the Gómez régime, it was pointed out that

the country remained peaceful, foreign capital was steadily being invested in the oil fields, the public debt was reduced, and the bolívar consistently remained at par. As for the debt, the figures indicated that the diplomatic debt of 1905, which amounted to £5,229,700 originally, had been reduced to £2,794,380 by 1922.

On July 1, 1925, a new constitution became effective, superseding that promulgated three years before. It provided for a Congress of two Houses, members of each of which were elected for three years, and for a President to be elected by Congress for a seven-year term. Under the strong hand of General Gómez, the country for the most part continued quiet, although a certain restiveness was at times apparent under the surface. In April, 1928, it broke out in open revolt, which was soon suppressed. Throughout the first months of 1929, revolutionary movements were continually being reported, but the rumors were consistently denied by the Government, which insisted that perfect order was being maintained throughout the country. When his seven-year term as President expired in the spring of 1929, General Gómez was unanimously reelected by Congress, May 3, 1929, but most unexpectedly, refused the office. When he persisted in his refusal, Congress created for him the position of commander-in-chief of the army and chose as President, on May 30, Juan Bautista Pérez, Chief Justice of the High Court of Cassation. The most notable development in Venezuela was the swift rise of petroleum production, giving the country a prominent rank among the world's leading producers.

VENICE. A seaport of Italy and capital of the province of the same name. The population in 1928 was estimated to be 253,608. To help relieve the city's great congestion, the Italian government in 1926 incorporated in Greater Venice the five mainland townships of Mestre, Fusina, Chioggia, Favaro Veneto, and Zelarino. The aggregate area of these towns is twice as large as that of Venice. The construction of the new port at Marghera on the mainland is restoring Venice's commercial prestige. Access to the port is by the Victor Emanuel III Channel, a direct prolongation of the Giudecca Canal. This channel, which was finished in 1922, is 4100 meters (4383 8 yards) long, 40 meters (131 2 feet) wide, and 10 meters (32 8 feet) deep. The port has been under construction since 1918 and comprises a series of large jetties, or piers in parallel lines, each 1000 meters (1093 6 yards) in length and 220 meters (231 7 feet) in breadth. It covers a total area of 3½ square kilometers (1 3 square miles), with 10,000 lineal meters (10,936 yards) of quays which will suffice for an annual traffic of 8,000,000 to 10,000,000 tons. The industrial zones, which have been reclaimed as a result of the dredging of the channels and the basins, extend to the north, south, and west of the port. Each zone occupies an area of approximately 3 square kilometers (1 15 square miles). In 1928 more than 40 manufactories had been established in these zones, and 35 others were either under construction or were planned. Beyond the industrial zones is the residential district, which has been laid out in the form of a garden city for the accommodation of a population of 30,000. A necessary sequel to the construction of the port at Marghera has been the improvement of the entrance channel from the Lido to the port of Venice, providing for a depth of 11 meters (36

feet) and a width of 150 meters (492.1 feet). In 1927, 3465 vessels of 3,418,226 tons entered the port of Venice and 3467 vessels of 3,410,812 tons were cleared. Saint Elena, on an island near the Lido, is another suburb which has been developed since the War, as a result of the city's need for expansion. In 1928 it had 5000 inhabitants, representing mostly the business and professional classes. The style of architecture is Venetian, in harmony with the more elaborate palaces on the mainland.

VENIZELOS, và'nê-zà'lôs, ELEUTHERIOS (1864-). A Greek statesman (see VOL XXIII). In 1914 he favored the cause of the Allies, and during that year and the next was in and out of office due to King Constantine's German sympathies. In 1916 he established a so-called Provisional Government of National Defense at Saloniki and gathered a volunteer army of 60,000 men. His government was recognized by England, France, and Russia, and when Constantine was dethroned, Venizelos returned to Athens, took control of Greece, and declared war against Germany and her allies (1917). He represented Greece at the Peace Conference, where he achieved brilliant results for his country, but an attempt was made on his life. In the fall elections (1920), he was overwhelmingly defeated and was exiled, coming to the United States in 1921. Urged repeatedly to return to Greece, he finally arrived in Athens in January, 1924, after the abdication of King George. He favored a plebiscite on the question of a monarchy or a republic, formed a cabinet, and was named president of the National Assembly. Ill health compelled him to decline the premiership of the new Republic, and to retire from politics. In May, 1928, after Greece had had a series of unstable governments and uprisings, he returned to Athens to prevent further conflicts between the Royalists and Anarchists. In July, 1928, after a sweeping victory in the elections, he again became Premier. See GREECE, under *History*.

VENTILATION OF TUNNELS. See TUNNELS.

VERBRUGHEN, HENRI (1873-) A British conductor, born at Brussels. He studied the violin under Hubay and Ysaye at the Conservatoire there (1887-92). In 1893 he became a violinist in the Scottish Orchestra at Glasgow, played a season in the Lamoureux Orchestra in Paris (1894-95), and returned to his former post in Glasgow. During the summers of 1895-97, he was concert master and assistant conductor of Rivière's Orchestra in Llandudno, Wales, and during 1898-1902, conductor of the summer concerts at Colwyn. In 1903 he settled in Glasgow as concert master of the Scottish Orchestra and director of the orchestral and chamber-music classes at the Athenæum, in 1911 he assumed also the conductorship of the Glasgow Choral Union. In 1903 he founded, with J. Cullen, D. Nichols, and J. Messeas, his own string quartet, which soon became famous. In 1915 he moved to Sydney, Australia, where he organized the National Conservatory and founded the State Orchestra, with which he gave regular series of symphony concerts in Sydney, Melbourne, Brisbane, and Adelaide, besides making an annual tour of New Zealand, thus totaling about 150 concerts a year. In 1918 he visited the United States, primarily for the purpose of studying American methods of instruction. He appeared successfully as guest-conductor of some of the great American orchestras. In 1921 he

returned to conduct several concerts of the Minneapolis Symphony Orchestra, of which he was appointed regular conductor in 1923. He also organized the Minneapolis Symphony Chorus.

VERDUN, BATTLES OF. See WORLD WAR.

VERHAGEN, BALTHAZAR (1881-). A Dutch author and professor of drama at the Municipal University of Amsterdam. Since 1915 he has been director of the School for Dramatic Art and he is also president of the League for Classical Drama at Amsterdam. His works include the plays *De heks van Overholland of eene, Schaking aan de Vecht* (1910), *The Tree of Life*, and *Orpheus*, the translations *Antigone*, *Cyclop*, and others, and *De tragische Maskers van Hellas* (1924), and various other books on the drama.

VERMONT. The forty-second State in size (9564 square miles) and the forty-fourth in population; capital, Montpelier. Vermont is one of the few States which showed a decrease in population in the decade 1910-20, when the population fell from 355,956 to 352,428, a loss of 1 per cent. The white population decreased from 354,298 to 351,817, the Negro, from 1621 to 572. The number of native whites rose from 304,437 to 307,291, that of foreign-born whites decreased from 49,861 to 44,526. The urban population mounted from 98,917 to 109,976, while the rural population fell from 257,039 to 242,452. The only important cities are Burlington and Rutland. The former increased from 20,468 in 1910 to 22,779 in 1920, and the latter from 13,954 to 14,954.

Agriculture. In common with the other New England States, Vermont has experienced a considerable decline in agriculture. The number of farms decreased 11.1 per cent, or from 32,709 in 1910 to 29,075 in 1920, and farther to 27,786 in 1925. The acreage in farms fell from 4,663,577 in 1910 to 4,235,811 in 1920 and to 3,925,683 in 1925. The improved land in farms totaled 1,691,595 acres in 1920. The percentage of the total land area used for agricultural purposes decreased from 79.9 in 1910 to 72.5 in 1920 and 67.2 in 1925. The total value of farm property rose from \$145,399,728 in 1910 to \$222,736,620 in 1920, or 53.2 per cent, but diminished to \$180,911,645 in 1925, the average value per farm was \$4445 in 1910, \$7661 in 1920, and \$6511 in 1925. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 24,889 were operated by owners, 307, by managers, and 2590, by tenants. The corresponding figures for 1910 were 28,065; 636, and 4008. White farmers in 1920 numbered 29,047, of whom 25,280 were native and 3767, foreign born. White farmers in 1910 numbered 32,689, 28,908 were native and 3721, foreign born. Farms reported under mortgage diminished in number from 12,225 in 1920 to 10,850 in 1925. The number of dairy cows was 345,643 in 1920; 279,448 in 1925. "Beef" cows numbered 4242 in 1920; 2135 in 1925; sheep, 62,756 in 1920, numbered 34,670 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 3,520,000 bushels; oats, 2,686,000; barley, 110,000; potatoes, 2,982,000; apples, 560,000, and hay, 1,497,000 tons. Comparative figures for 1913 are corn, 1,665,000 bushels; oats, 3,081,000; barley, 384,000; potatoes, 3,175,000; and hay, 1,280,000 tons.

Manufactures. Although one of the smallest States in population and area, Vermont has considerable industrial importance. There were

three cities with more than 10,000 inhabitants in the State in 1920. These contained 13.5 per cent of the total population and in 1919 reported 20.6 per cent of the State's manufactured products. There were 1958 manufacturing establishments in the State in 1909; 1790 in 1919; 951 in 1925; and 880 in 1927. Wage earners in manufactories numbered 33,491 in 1919; 27,563 in 1925; and 26,241 in 1927. Capital invested amounted to \$73,470,107 in 1909 and \$134,314,391 in 1919. The value of manufactured products was \$68,309,824 in 1909; \$168,108,072 in 1919; \$138,269,861 in 1925; \$134,029,978 in 1927. The large increase in the value of products evidenced in 1919 was partly due to the change in industrial conditions brought about by the War and cannot be properly used to measure the growth of manufactures during the war period. Marble and stone work is first among the industries in value of product. This amounted to \$12,395,000 in 1909; \$17,426,000 in 1919; the value of marble, slate, and stone products for 1927 was \$21,317,503. Woolen and worsted goods attained a production of \$4,497,000 in 1909; \$4,635,000 in 1914; \$17,426,000 in 1919; and \$10,939,729 in 1927. The manufacture of wood pulp and paper amounted to \$3,902,000 in 1909; \$10,863,000 in 1919; \$9,744,845 in 1925; and \$0,751,433 in 1927. Butter, cheese, and condensed milk products attained \$8,112,000 in 1909; \$8,696,000 in 1914; \$9,829,701 in 1919, and \$6,036,403 in 1927. The most important manufacturing cities are Barre, Burlington, and Rutland.

Mining. Vermont has no metal mining; the only mineral products of importance are stone, slate, lime, and talc. In the production of both granite and marble, the State continued to hold an important rank. In 1914 the value of the stone produced was \$6,635,477; 1918, \$5,505,895; 1920, \$10,065,759; 1921, \$7,322,843; 1926, \$9,244,465. The total value of the mineral products of the State in 1926 was \$14,955,161, compared with \$15,008,894 in 1920, \$11,728,052 in 1919; \$9,158,945 in 1918; and \$8,665,867 in 1914.

Education. Educational development in Vermont, in its more recent stages, has been marked by many important legislative and administrative measures. Especial attention was given to training teachers. High-school teacher training, or normal, courses, established throughout the State in 1912, were opened to high-school seniors or graduates, and have graduated some 2500 elementary teachers. The Legislature of 1921 enacted a new law under which the State Board of Education established three two-year teacher training, or normal, courses, at the University of Vermont and Castleton and Lyndon institutes. A director of teacher training was employed and special efforts were made to enroll a large number of prospective teachers, over 420 students were entered in all courses in that year, as compared with 280 in the year preceding. In 1922 the standard of admission for all classes was raised to high-school graduation. The growth in number of trained teachers had been very encouraging. The Legislature of 1923 changed the law relating to the supervision of schools in several important particulars. The local support of schools increased greatly. Special efforts were made to improve rural-school conditions to better the quality of supervision, training of teachers, buildings, and the health and physical vigor of the children. Vocational work was carried on under the provisions of the Smith-Hughes Act after 1917. The total enroll-

ment in the public schools in 1913 was 64,825; in 1925-26 it was 64,046. In the high schools in the latter year, there were enrolled 10,495 pupils. Expenditure for schools was: current, \$4,248,718; outlays, \$277,113. The percentage of illiteracy in the State decreased from 4.6 in 1910 to 3.8 in 1920, in the native white population, from 0.9 to 0.6 per cent; in the foreign-born white, from 15.4 to 10.4; in the Negro, from 13.3 to 7.7.

Finance. State expenditure in the year ended June 30, 1928, as reported by the U. S. Department of Commerce, was: for maintenance and operation of government departments, \$6,365,784 or \$18.06 per capita. Of this amount, \$527,479 was aid to local education; for interest on debt, \$63,277; for permanent improvements, \$2,998,807; total, \$9,427,868 (of which \$5,345,505 was for highways, \$2,716,534 being for maintenance and \$2,628,971 for construction). Revenue was \$8,085,277 or \$22.94 per capita. Of this, property and special taxes formed 36.4 per cent, departmental earnings and charges for officials' services, 5.2 per cent, sales of licenses and taxation of gasoline, 43.6 per cent. Property valuation was \$321,485,115; State taxation thereon, \$1,174,203. Net funded State debt on June 30, 1928, was \$6,701,532, due to the issues of flood bonds aggregating \$5,000,000.

Political and Other Events. The State, always steadily Republican, remained politically true to form from 1914 on. In 1914 Senator Dillingham was reelected and C. W. Gates, Republican candidate, was elected governor. During this year, a commission carried on a survey of the educational system. In accordance with a constitutional amendment adopted by the people, the State courts were reorganized. In 1916 Horace F. Graham, Republican, was elected governor. At this election, a constitutional amendment providing for a direct primary law was adopted. Carroll S. Page was reelected to the United States Senate. By the amended State constitution, as ratified by popular vote in 1913, State elections formerly held in September were held in November, starting with 1916. For President, Hughes received 40,250 votes; Wilson, 22,708. In 1918 the Republican candidate for governor, P. W. Clement, was elected. In the elections of 1920, James Hartness, Republican was elected governor, and Senator Dillingham was reelected. For President, Harding received 68,212 votes; Cox, 20,919. Redfield Proctor, Republican, was elected governor in 1922, and Frank L. Green, Republican, was elected United States Senator. Senator Dillingham died in 1923, and Porter H. Dale was elected to succeed him. The vote for President in 1924 was Coolidge, 80,498; Davis, 16,124; LaFollette, 5,964. Franklin S. Billings was elected governor. John E. Weeks was elected governor in 1926, and Senator Dale was reelected. The heaviest rains in many years caused, in the first week of November, 1927, a calamitous flood, particularly on the Winooski. In all, 84 lives were lost and damage was done to buildings, bridges, highways, and railroads, to an estimated total of \$30,000,000. In 1928 for President, Hoover received 90,404 votes; Smith, 41,440. Governor Weeks and Senator Green were reelected.

Legislation. The Legislature voted to submit to the people a prohibition law at the election of 1916. This law was defeated. The Legislature, in 1917, repealed the Prohibition Act of 1915. Amendments were made to the child-labor laws, and a State accounting system was created.

Women taxpayers over 21 years of age were permitted to vote in town meetings. The Legislature of 1919 legalized absentee voting and made provision for a farm census. A teachers' retiring system was established. A measure was passed forbidding the display of the red flag in public. In 1921 provision was made for planning commissions in cities, towns, and villages. A direct-primary law was amended; presidential primary laws were repealed; provision was made for the regulation of workmen's-compensation insurance, and it was provided that no person should be debarred from public service on account of sex. Administration of motor-vehicle laws was entrusted in 1925 to a bureau under the Secretary of State, and it was made possible for street railroads to operate motor vehicles. A special session in December, 1927, provided funds for restoring highways and bridges ruined in the 1927 flood.

VERMONT, UNIVERSITY OF. A coeducational State institution at Burlington, Vt., founded in 1791. The student enrollment increased rapidly, from approximately 600 in 1914 to 1310 for the year 1928-29, with 912 in the summer session of 1928; the faculty rose from 100 to 150; and the library from 90,000 to 133,000 volumes. The income showed a corresponding increase during the period, from \$210,000 to \$600,000, and the productive funds from \$943,423 to \$1,900,000. The Ira Allen Chapel, a gift from James B. Wilbur, was erected in 1926. President, Guy W. Bailey, LL.D.

VERSAILLES, TREATY OF. See LEAGUE OF NATIONS, PEACE CONFERENCE AND TREATIES.

VESSELS, NAVAL. During the years that have elapsed since the Washington Conference for the Limitation of Armaments and the signing of the Five-power Pact, the construction of naval vessels, except in the United States, has not materially decreased. It has merely changed direction, concentrating upon vessels that were not limited by the Pact all of the effort, and probably all of the money, that would have been used in naval shipbuilding—largely no doubt for capital ships—under the old conditions. The United States alone followed the spirit of the Pact, but at the end of half a dozen years, finding that Great Britain, France, and Japan were building great numbers of large cruisers, large destroyer leaders, large destroyers, and large submarines, she reluctantly began to build cruisers herself. The answer was immediate. Great Britain, having built as many 10,000-ton cruisers as she needed, desired to check the building by the United States and indicated a willingness for a new conference, presumably to consider further limitations. This was held at Geneva in 1927. As the British proposals concluded a doubling of existing British cruiser tonnage, instead of a reduction, as well as other suggestions designed to weaken the relative power of the United States fleet and to preserve and increase British superiority, and as her delegates firmly adhered to the increased cruiser tonnage to the end, the new conference adjourned without accomplishment. In October, 1929, another conference for the consideration of further limitations of naval armaments was called by the British government to be held in London early in 1930. In the following notes, the existing types of naval vessels are briefly described.

Aircraft Carriers. These vessels are designed, not only for the purpose of transporting aircraft and aircraft supplies, but to furnish a long, broad deck from which airplanes fitted with landing gear can take off, or on which they can effect a landing. Vessels of less than 10,000 tons, which are fitted to carry aircraft and aircraft supplies, are not, by the terms of the Five-power Pact, rated as aircraft carriers. Most of them are called aircraft tenders or aircraft transports; neither their numbers nor total tonnages are limited by the Pact; of existing ships, only two have full-length flying decks. The U. S. tender, *Patoka*, has a fully-equipped mooring mast for airships. No aircraft carrier commenced after the signing of the Pact may exceed a "standard" tonnage (see NAVIES OF THE WORLD) of 27,000; but the United States and Japan were each allowed to transform two battle cruisers under construction, but which were to be scrapped, into carriers of not more than 33,000 tons. All four—*Lexington*, *Saratoga*, *Akagi*, and *Kaga*—are completed. The *Kaga*, commenced as a battleship, was substituted for the battle cruiser *Amagi*, which was irreparably damaged by the great earthquake of 1923. The flying decks of aircraft carriers are kept as free as possible from obstructions; smokepipes, deck houses, masts, etc. are grouped along a narrow strip at one side or otherwise placed in a way to cause no interference with airplane movement. In some carriers, the smokepipes and masts rise from the side beyond the edge of the flying deck and are hinged so that they may be turned down below the level of the deck when airplanes are landing or taking off. Aircraft carriers and tenders are fitted with repair shops adequate for all ordinary aircraft repair and have quarters for the crews of the planes they carry or attend.

Armored Cruiser. This is a type of war vessel which is obsolete though many of them are still in use for peace purposes. It was designed to meet and destroy the protected cruisers of the enemy. In addition to light armor (3 to 8 inches), it carried heavier guns than most protected cruisers and had at least equal speed. The battle cruiser is its development in one direction and the large light cruiser in another.

Armored Ship. Any ship carrying armor, but especially one carrying heavy armor, is known as an armored ship. Many light cruisers have thin armor belts, decks, conning towers, and gun houses, but are not called armored ships because of the thinness of the armor. See *Battleship*, *Battle Cruiser*, *Armored Cruiser*, *Monitor*, etc.

Battle Cruiser. The battle cruiser differs from a battleship only in having a much higher speed and much thinner armor. The guns of the main battery are of the same or about the same calibre and power as those on contemporary battleships, but may be fewer in number. Great Britain and Japan are the only countries possessing battle cruisers at present. In accordance with the terms of the Five-power Pact, the United States scrapped six and Japan two that were under construction, and Germany lost all of hers by the terms of the Treaty of Versailles.

Battleship. A battleship is a war vessel possessing the greatest offensive and the greatest defensive power, especially the former, which can be given to a ship without rendering inadequate such other necessary attributes as speed, habitability, seaworthiness, etc. Existing battleships may find new enemies which are too strong for them.

Their design must then be so changed as to enable them to meet and conquer each new enemy or to render its attack comparatively innocuous. The "wooden walls" of the early nineteenth century put on armor to defend themselves against the increasing power of the gun and the explosive shell. Later types were fitted with numerous water-tight compartments, underwater armor, and the "bulge" or cellular belt, in order to meet the growing menace of the torpedo and the submarine mine, and to meet the torpedo carrier, surface, air, or submarine, a numerous battery of guns of moderate calibre was mounted. Further protection was derived from accompanying vessels, the light cruiser and the destroyer. Battleships, like other surface and submarine vessels, are now called on to meet bombing attack from the air, they must have armored upper decks and strong batteries of anti-aircraft guns and must be defended in the air by accompanying aircraft as they are defended on the water by cruisers and destroyers. The only battleships designed and laid down since the danger of aircraft bombing was fully gauged were the British ships, *Nelson* and *Rodney*. They are of 35,000 tons, the greatest size permitted by the Five-power Pact, and their design, of a very new type, has been studied with interest by other powers. (See NAVIES OF THE WORLD, *Great Britain*.) A ship of premier force, capable of taking its place in the line of battle in a fleet action, is known as a capital ship. According to present classification, capital ships are either battleships or battle cruisers. The Five-power Naval Pact defined a capital ship as a vessel, not an aircraft carrier, with a displacement over 10,000 standard tons, or carrying a gun of a calibre in excess of 8 inches. No capital ship of more than 35,000 standard tons may be constructed by one of the signatory powers.

Cruiser. Cruisers are of four types battle, armored, protected, and light. Armored (already described) and protected cruisers are obsolete. The latter derived its name from an armored deck covering the machinery and other vital parts, it was flat amidships but inclined downward at the sides at an angle about 40 degrees, the lower edge reaching the side at 5 to 8 feet below water. Light cruisers are a development of the protected-cruiser type. The distinguishing characteristic is very high speed. Some have water-line belts of thin armor, 3 to 5 inches thick, and some have part or all of the main battery guns in lightly armored turrets or gun houses. Under the terms of the Five-power Pact, light cruisers cannot have a displacement in excess of 10,000 tons or guns of a greater calibre than 8 inches. Nearly all the light cruisers designed since the Washington Conference are of 10,000 tons and carry 8-inch guns. A few smaller ones are under construction or completed and many others are likely to be built in the near future. In those of less than 7000 tons, the guns—or most of them—probably will be of calibres of less than 8 inches. See NAVIES OF THE WORLD, *France, Japan, Great Britain, United States*, etc.

Destroyer. Vessels of this type were originally designed to drive off or destroy torpedo boats, hence the name. The small torpedo boat is now obsolete, but the destroyer has succeeded to its functions and in addition has become the greatest protector of large vessels against submarine attack. The latest types of destroyers are from 1200 to 1500 tons with a maximum speed of 34 to 36 knots, 6 torpedo tubes, 4 guns

of 4- to 5-inch calibre, and 1 or 2 anti-air-craft guns. See NAVIES OF THE WORLD, *France, Japan, Great Britain, Italy*, etc.

Flotilla Leader or Destroyer Leader. An enlarged destroyer designed to act as flagship for the commanding officer of a destroyer flotilla. The displacement is from 1500 to 2800 tons. The maximum sea speed is usually slightly greater than that of the destroyers of their flotillas and the battery about 50 per cent more powerful. See NAVIES OF THE WORLD, *France, Italy, Great Britain*, etc.

Fuel Ship. Naval fuel ships were formerly colliers. They are now oil tankers. In addition to fuel oil, they usually carry lubricating oil, cotton waste, and other engineering supplies which are bulky and much used.

Hospital Ship. A vessel especially fitted for the care and transportation of the sick and wounded is known as a hospital ship. During the World War, dozens of such ships were needed, and passenger ships were refitted and adapted to the service.

Mine Layer. Mine layers are of all sizes and kinds, from small launches to vessels of 5000 tons or more. Large mine layers carry their main supply on the lower decks or in the holds. The main operating deck is fitted with fore and aft tracks or trolleys on which the mines are placed when hoisted from below and from which they are dropped after being carried to the stern. Just before launching, the safety device is removed or set for service. The mine is still inoperative and will not explode until anchored in place, when the remaining safety fittings are automatically released. A type of small fast mine layer has been developed by the transformation of destroyers. The average capacity is 50 to 100 mines. During the World War, mine-laying submarines were developed and much used. They carry the mines (ready for dropping) in inclined tubes extending from the deck through the bottom. Mines may be planted by submarine mine layers in places where the use of surface vessels would be impracticable. See MINE, SUBMARINE.

Mine Sweeper. As mines are usually anchored so as to be held 12 feet or more below the surface, it is highly desirable that mine sweepers should draw less than 12 feet of water, 3 or 4 feet less is practicable. The great German mine-laying campaign, begun at once on the declaration of war and continued to the Armistice, found the British almost without mine sweepers. Fortunately, the steam trawlers, used so extensively in the British fisheries, were very efficient sweepers when they were fitted with proper appliances and their officers and crews had received suitable training. They continued to form the greater part of the mine-sweeping fleet, at the end of the War, out of 726 sweepers in service, 412 were trawlers, 110 were destroyers or vessels built as mine sweepers, 52 were small paddle steamers, 142 were drifters, and 10 were sweepers of the "Dance" type. The danger of sweeping is shown by the fact that 214 sweepers were sunk or very seriously damaged. The boats (about 100 in number) which were specially built for sweeping were of 750 to 800 tons with a draft of 7 feet and had about 16 knots speed; one-third were paddle steamers and the others had twin screws. These vessels with the destroyers, formed the fast mine sweepers. Sweeping was effected by a wire cable 500 yards long, whose ends were carried by sweepers. This often exploded the mine or parted its mooring rope; if neither happened, bombs or

depth charges were dropped on it. In 1915 the paravane (see PARAVANE) appeared, and this was followed by the later type with cable-cutting jaws. Mines rising to the surface after the cutting of their cables were destroyed by gunfire. In times of peace, only a moderate number of the best types of mine sweepers are retained in service in most navies.

Monitors. The monitors built during the World War were shallow-draft armored vessels of moderate speed, used chiefly on the Belgian coast. Most of them had a single turret and carried guns of 6- to 15-inch calibre. Although styled monitors, they all had rather high freeboard; and all were fitted with anti-torpedo "bulges" on their sides. The Italians used enormous raft-line structures for defense of their army's right flank. Each of these carried a turret mounting heavy guns.

Patrol Boats. Probably 2000 of these were used in the World War by the Allies alone. They were of every conceivable type of small craft, yachts, motor boats, old torpedo boats, small destroyers, and boats built for the service. Of the latter were the P boats of Great Britain and the Ford boats built in the United States. Both types were about 600 tons. None of the Ford boats was completed in time for active service abroad. The fast motor boats were commonly called submarine chasers.

Q Ships. These were decoy ships that were used in the World War for the destruction of enemy submarines. Small and old merchant steamers, sailing vessels, gunboats, etc., were transformed into inoffensive-looking craft apparently employed in coastal traffic or trade with Norway. All sorts of expedients were used to entice submarines within easy range, one of which was for part of the ship's force called the "panic party" to abandon a ship ostentatiously when the submarine opened fire. If the latter approached close enough, the guns were uncovered and fire opened. Many U boats were sunk by Q ships, and many Q ships were sunk by their adversaries.

Repair Ships. These are vessels fitted as floating workshops, with all kinds of tools and appliances for the repair of vessels which are far away from their bases. As the naval operations of the World War were mostly confined to the small North Sea area, few of these were necessary. Repair ships for aircraft, submarines, and destroyers are called aircraft tenders, submarine tenders, etc. They have quarters for the officers and men of their flotillas who need medical attention, rest, etc. They carry supplies of all sorts and a repair shop capable of making ordinary repairs. Aircraft tenders usually carry extra aircraft.

Submarines. Submarines are vessels designed for navigating below the surface of the sea. Naval submarines are principally designed for the attack of the enemy's vessels with torpedoes and have fixed torpedo tubes both forward and aft. The submarine's ability to quickly conceal itself beneath the water renders it very, very useful for certain classes of scouting and mine laying.

The rapid development of the submarine during the World War has led to the division of the various designs into types or classes. The present (1929) classification is as follows: Submarine Cruisers which are large enough to carry small bodies of troops, cargo, or important supplies over long distances; fleet submarines, large enough to have such sea-keeping qualities as will enable

them to accompany the fleet; cruising submarines, large enough to keep the sea for a month or two and operate independently at long distances from any base; coast-defense submarines of small size designed to operate from ordinary harbors or nearby bases; mine-laying submarines, all sizes.

The only submarine specifically designed as a submarine cruiser in 1929 was under construction for the French Navy. Its surface displacement is reported to be 3250 tons. Fleet submarines are of 1700 to 3000 tons with a surface speed of 18 to 22 knots; cruising or high-sea submarines are of 900 to 1800 tons with moderate speed and long radius of action; coast-defense submarines are of 600 tons or less and small cruising radius; mine layers range from 300 to 3000 tons depending upon the character of the service for which designed. See SUBMARINES AND THEIR WAR ACTIVITIES; NAVIES OF THE WORLD; and TORPEDO BOAT, SUBMARINE (VOL. XXII, p. 353).

Supply Ships. These vessels are of the cargo type and are fitted as refrigerator ships, general supply ships, and ammunition ships, or a combination of two or more of these types.

Tenders. These are vessels designed to accompany aircraft, destroyers, submarines, etc., and to act as a movable base of supplies, repairs, etc. See *Aircraft Carrier* above.

Torpedo Boat. A small, fast boat designed to use torpedoes in the attack of large vessels. The torpedo boat and the destroyer are small craft of the same general type. In the nineties, torpedo boats were of less than 200 tons and very numerous. In 1893 the British Navy built the *Havock* and *Hornet* of 240 tons to defend vessels against torpedo boats by attacking the latter. They were therefore styled torpedo-boat destroyers. Besides having greater displacement, they carried 6-pounder and 12-pounder guns, while torpedo boats mostly carried 3-pounders. After that time, the destroyer gradually grew in size and took on other functions. A few torpedo boats for harbor and smooth-water service were built in recent years, but the type is almost obsolete. Old destroyers of less than 1000 tons are often classed as torpedo boats.

Transport. A vessel fitted for the transportation of troops, animals, or supplies. No nation possesses many of these; therefore, in times of war, merchant vessels have to be used and altered to adapt them to the service. In the World War, the American (formerly German) passenger steamer, *Leviathan*, after fitting as a transport, carried 10,000 officers and men on each trip, in addition to her own complement.

U Boat. A name applied to German submarine boats because they were officially designated by a number preceded by the letter U, as U125. The "U" is an abbreviation of *untersee* (under water). See *Submarines*, above.

Submarine Chaser. See *Patrol Boat*, above.
VETERANS' BUREAU. See AGRICULTURAL EDUCATION; UNITED STATES, *History*.

VETERINARY MEDICINE. A gradual rise in the educational standards of this profession resulted in the requirement of four years' high-school education or its equivalent for the class entering in the fall of 1919 and thereafter for the accrediting of a veterinary college and the eligibility of its graduates for United States government service. The requirements for admission to civil-service examination for the government service were raised so that, after the

fall of 1917, a fourth year of study at a veterinary college, with an increased number of hours, was required. The conditions attending upon the World War brought a great decrease in the number of students enrolled at veterinary colleges in the United States. With the close of the War, the attendance increased somewhat, but later declined, in part because of the increased educational requirements. These conditions resulted in the discontinuance of several colleges, and by 1927 there were but 10 accredited colleges in the United States, with a total student enrollment of 606. Among those which gave way to State-supported schools were some of the oldest and best-known institutions.

Bovine Tuberculosis Eradication. In his annual report for 1916, the United States Secretary of Agriculture called attention to the wide dissemination of tuberculosis of farm animals, pointing out that it may be transmitted to man and is the source of annual losses in the United States estimated at more than \$25,000,000. He outlined undertakings leading to its eradication, and asked for an appropriation of \$75,000 to inaugurate the work. Congress responded with allotments for its investigation and eradication amounting to \$300,000, of which \$132,618 was expended. Offices were at once opened at several points in the country, and cooperative work commenced with the view to eradicating the disease from, and the establishment of, accredited purebred herds. In December, 1917, rules and methods were adopted, the plan followed being to test cattle with tuberculin, to eliminate any reacting animal, usually by slaughter, to repeat the test at prescribed intervals, and to list as tuberculosis-free, accredited herds all of which successfully pass two annual or three semi-annual tests, official certificates being issued to the owners of such herds. In 1918 Congress provided for the payment of one-third of the difference between the appraised and salvage value of the slaughtered animals, no payment by the Federal government to be more than \$25 for a grade animal or more than \$50 for any purebred animal. Increased appropriations for the work were made by Congress from year to year until 1927-28, when the annual appropriation had reached \$5,964,000, and the combined State appropriations were more than \$13,000,000, a large proportion of which was for payment of indemnities. By 1922 the cooperative eradication work had been extended to include all the 48 States and the Territories of Alaska and Hawaii.

A rapid growth took place in the area-eradication work and by the close of the fiscal year ended June 30, 1928, 1119 counties and the District of Columbia had engaged in the work, and 527 were modified accredited areas. By that time, there were 167,472 herds containing 2,164,105 head of cattle accredited as tuberculosis-free, and approximately 35 per cent of the entire cattle population of the United States was under supervision. The work of eradicating tuberculosis from swine and poultry had been undertaken and was progressing satisfactorily and work looking to the eradication of paratuberculosis, known as Johne's disease, of cattle had just commenced.

Late in October, 1927, the State of North Carolina completed the tuberculin testing of all cattle in its 100 counties and was the first State to have all of its counties classed as "modified accredited" areas, in which areas not more than 0.5 per cent of the cattle are tuberculous and from which all animals reacting to the test have been

removed for slaughter. Maine was following closely with 13 of its 16 counties on the modified accredited list.

The degree of infection of cattle throughout the United States had been reduced from 4 to nearly 2 per cent, and by Jan. 1, 1929, a total of 581 counties and 21 townships in 11 States had been placed on the modified accredited list.

Texas Fever and Tick Eradication. As a result of eradication work with the cattle tick, 760 of the 985 counties originally quarantined had been released by July 1, 1928, as tick-free, and this included all of 6 of the 15 States quarantined in 1906.

Anaplasmosis of Cattle. This disease, formerly associated with piroplasmosis, or Texas fever, of cattle and supposed to be tick-transmitted, has appeared independently in the last few years in Florida, Louisiana, Texas, Kansas, Oklahoma, Nevada, and California, and has been the source of serious loss.

Dourine. The occurrence of this disease of the horse, due to *Trypanosoma equiperdum*, necessitated eradication work by the U. S. Department of Agriculture under annual appropriations by Congress, varying from \$27,800 to \$97,800. The work has progressed until the disease occurs only on the Navajo Indian Reservation in Arizona and in a small section of northern Montana.

Foot-and-Mouth Disease. This disease of live stock, particularly of cattle and swine, has, because of its epizootic nature, continued to be one of those most dreaded by the live-stock interests. Three countries, Canada, Australia, and New Zealand, have been entirely free from it for many years; others, including the United States, Great Britain, and Sweden, have been visited by it from time to time and have applied the slaughter stamping-out policy, as the British dominions mentioned and Norway would if they were to be invaded. They prohibit the entry of live stock or apply drastic quarantine laws against the entry of diseased animals. Other countries where the disease is present deal with it by isolating infected stocks, regulating live-stock movement within their boundaries, and quarantining the animals they import, or they let the disease take its course without interference. Denmark and Holland have periodically freed themselves from the disease, but became re-infected from neighboring countries.

Eight outbreaks have taken place in the United States, in 1870, 1880, 1884, 1902, 1908, 1914, and 1924 (two). That of 1914 was by far the most serious, extending into 21 States and the District of Columbia, and necessitating an expenditure of over \$5,500,000. The animals slaughtered at the last outbreak included 69,742 cattle, 73,574 swine, 8742 sheep, and 99 goats, with a total appraised value of \$5,243,138.55. The first three outbreaks were caused by the importation of infected animals; the fourth and fifth, by the importation of contaminated cowpox vaccine virus; the sixth was caused by contamination through contact with leather or leather products imported from a foreign country in which the disease occurred, the seventh is supposed to have originated in the feeding of pigs with garbage from a steamship arriving from a foreign port; and the eighth, not definitely determined. In England, where the disease has appeared from time to time, investigations indicate that the infection may even be introduced by birds migrating from the Continent, or be air-borne.

Infectious Abortion of Live Stock. This disease of cattle, horses, sheep, and swine has continued to increase in importance and, since the advance in the eradication work with tuberculosis, has surpassed that disease in the monetary loss caused. It is responsible for the loss of the offspring, a decrease in the flow of milk, and sterility. Both the porcine forms of the organism appear to be the cause of undulant fever (Bang) in man, which has appeared with increasing frequency in the last few years.

Undulant Fever. This dual disease of man may be caused by the *Brucella melitensis* of Bruce, contracted from an affected goat and known as Malta, Mediterranean, or undulant fever (Bruce); or caused by the *Brucella abortus* of Bang, contracted from cattle or swine and known as undulant fever (Bang).

The form contracted from the goat, which occurs in, and was first described from, the Mediterranean region, was recognized in 1911 as occurring in the United States. It was discovered in that year to be endemic among goats in southwest Texas, and in 1922 an outbreak took place in Phoenix, Ariz., in which more than 30 human cases were positively diagnosed. In the last few years, undulant fever (Bang), which appears to be caused particularly by the porcine strain of the abortion organism, has been differentiated from typhoid and other fevers and been found to occur with increasing frequency.

Hog Cholera. This affection was estimated by the Federal government in 1923 to cause a mortality of 4.05 per cent, a large reduction from the preceding year, and to be responsible for about 80 per cent of all hogs lost by disease. In that year, 2,564,837 hogs, valued at \$29,393,032, were destroyed by it. Control work was commenced by the U. S. Department of Agriculture in 1913 under an appropriation by Congress of \$75,000, which was increased in amount from year to year until in 1919 the sum of \$641,045 was made available for investigation, demonstration, education, and control work. The work has consisted in the making of surveys, production and use of serum on hogs on infected and exposed farms, sanitation and quarantine work, and organization of farmers to cooperate with the State and Federal authorities. Studies of a disease known as "hog flu," which has appeared and caused large losses in the hog-raising States, have shown that it is not related in any way to hog cholera.

Botulism and Forage Poisoning. Investigations have shown that *Bacillus botulinus* is probably the cause of much of the loss among horses and mules resulting from forage poisoning and also is a cause of limberneck in chickens. See BOTULISM.

Bacillary White Diarrhoea of Fowls. The cause of this, perhaps the most important disease of the fowl, was found in 1899 to be due to a bacterium now known as *Salmonella pullorum*. The investigations that followed have shown that it may cause loss through (1) a marked reduction in fertility, (2) lowered vitality or death of chicks in the shell, (3) death of the young chick, (4) stunting of chicks that survive, (5) reduction in the number of eggs laid, and (6) even death of grown fowls from acute and chronic forms of the disease. The causative organism occurs in the ovary of the carrier hen from which it may pass into the yolk and be transmitted through the egg. The organism also may be transmitted from chick to chick through contam-

ination in the incubator and brooder, and to both chick and adult through the consumption of infected eggs. Remedial treatment has been found to be of little avail, and chicks should be reared only from flocks known to be free from the infection, including those from which it has been eliminated through application of the blood test.

Parasitology. Equine piroplasmosis due to *Protoplasma equi* was discovered for the first time on the American continent in 1913, it being found endemic among native horses in the interior of Panama. *Cysticercus ovis*, the intermediate stage of a dog tapeworm (*Taenia ovis*), was shown in 1913 to be the cause of tapeworm cysts, or measles, in mutton, and of common occurrence in sheep in the western United States. Tapeworm cysts in beef carcasses were found in 1914 to be destroyed by an exposure for six hours to a temperature of 12 to 15° F. Important studies of Manson's eye worm of chickens were reported from Hawaii, Florida, and Australia. The cockroach was found to act as the intermediate host. Studies of *Trichinella spiralis* have shown that the larvae in pork die after an exposure to a temperature of 131° F. gradually attained, and this is held to be the thermal death point. Refrigeration at a temperature of 5° F. for a period of 20 days was found in 1915 to destroy it in pork. *Habronema muscae* was discovered in 1913 to be transmitted by the house fly. It was shown in 1915 that larvae of the ox warble enter the host by penetrating the skin. The intermediate or cysticeroid stage of the tapeworm *Choanotenia infundibuliformis* of chickens was found in 1916 to occur in the common house fly. It was demonstrated in 1918 that *Ascaris lumbricoides* of man and swine has a direct life cycle, and that no intermediate host is required. The embryos hatch out in the alimentary tract, migrate to the lungs and other organs, and cause pneumonia of pigs, the symptoms of which are commonly known as thumps. Carbon tetrachloride was found in 1921 to be highly efficacious in the removal of hookworms from dogs and foxes, ascarids from dogs, and large strongyles from horses. The third-stage larva of a cat and dog hookworm, *Ancylostoma brasiliense*, was found in 1926 to be the cause of a creeping eruption of man.

Journals. In 1915 the *American Veterinary Review*, the oldest veterinary journal published in America, having completed its 47th Volume, became the *Journal of the American Veterinary Medical Association* and was edited by the secretary of that Association. In 1920 the name of the *American Journal of Veterinary Medicine* was changed to *Veterinary Medicine*. The *North American Veterinarian* and the *Canadian Veterinary Record*, a quarterly journal, both commenced publication in 1920.

VIBRATION. See PHYSICS.

VICTOR EMMANUEL III. See ITALY, History.

VICTORIA. A state of the Commonwealth of Australia in the southeastern part of the continent. Area, 87,884 square miles; population in 1911, 1,315,551; in 1928, 1,748,610, annual average increase, 1.54 per cent. Melbourne, the capital and largest city, including its suburbs, had 975,160 inhabitants in 1928 (591,830 in 1911). In 1921 about three-fifths of the total population was urban. Farming continues to occupy a leading place in the state's activities. Wheat, hay, oats, barley, and potatoes are the most important crops. Pastoral pursuits fol-

lowed next in importance. The wool output in 1919-20 was 132,847,000 pounds; in 1926-27, 121,299,621, as compared with the 1913-14 output of 106,833,000 pounds. The mineral production in 1927 was valued at £1,877,000, as compared with £2,344,744 in 1913. The gold yield steadily dropped; the output was worth only £103,699 in 1927 (£1,847,475 in 1913). In 1926-27, 101,639 employees were engaged in manufacturing (118,744 in 1913). Values for production in 1926-27 were: agricultural, £15,744,992; pastoral and dairying, £22,380,367; mining, £1,880,242; forest, £1,880,799; miscellaneous, £5,542,600; total, £47,336,983; manufacturing value added, £51,005,430. Imports overseas in 1913 were valued at £24,387,073; in 1927-28, £48,108,752. Exports for the same years were £17,835,395 and £31,057,025. Leading exports are gold, wool, cereals, and meats. In 1928 there were 4749 miles of railway open (3747 in 1914). Government accounts showed revenues for 1912-13 and for 1927-28, £10,287,285 and £26,566,864, expenditures for the same years, £10,258,081 and £26,730,217. Public works continue to account for the increased public debt. In 1912-13 the debt amounted to £62,776,724, in 1928 it had increased to £158,183,470. Unlike the other states, Victoria is the seat of Australian Conservatism, her large agricultural population making for stability.

VICTORIA. The capital of the Province of British Columbia, Canada. The population in 1928 was estimated to be 65,000. Greater Victoria, which includes Oak Bay, Esquimalt, and part of Saanich, has an area of 13½ square miles, 78 miles of paved streets, 65 miles of boulevards, and 14 public parks, with a combined area of 1600 acres. Victoria is the first and last Canadian port of call on the Pacific coast. Its harbors are capable of accommodating the largest ships afloat, and the second drydock in size in North America, 1150 feet long by 149 feet wide and 49 feet 5 inches deep, was built in the Esquimalt Harbor at a cost of more than \$6,000,000. Victoria has three harbors, the outer harbor comprising Rithet's wharves, with an area of 16 acres, and the Canadian National Docks at Ogden Point, covering 30 acres, the inner harbor which is used chiefly by coastwise vessels, and the famous Esquimalt Harbor, 940 acres in extent. Victoria's annual sea-borne tonnage is more than 12,600,000, its exports are valued at \$3,282,834 and its imports at \$6,470,269. In 1928, 2737 persons were employed by the industrial establishments of the city and received \$3,270,449 in wages; the value of products manufactured was \$10,498,975.

VICTORY LOAN. See UNITED STATES, under *History*.

VIEBIG, FÉBLIK, CLARA (1860-). A popular German novelist (see Vol. XXIII). She is the author of *Mutter und Frauen* (1918), *Eine Handvoll Erde* (1920), *Tochter der Hekuba* (1922), *Das rote Meer* (1920), *Menschen und Strassen* (1923), *Unter dem Freiheitsbaum* (1923), *Der einsame Mann* (1924), *Passion* (1925), *Franzosenzeit* (1925), and *Die goldenen Berge* (1927).

VIENNA. The capital of the Federal Republic of Austria. The population at the census of 1923 was 1,857,400, having decreased from 2,031,498 before the World War. Since 1921 the city has formed a separate province within the Republic, and the Parliament Building, formerly the seat of the Imperial Diet, has been occupied by the two chambers of the Federal Congress of Austria—the Nationalrat and the Bundesrat.

The former royal palaces have been converted into museums and government buildings. The Belvedere, the residence of the Archduke Francis Ferdinand whose assassination led to the outbreak of the World War, contains two galleries devoted to the artistic productions of the eighteenth and nineteenth centuries; in 1929 the Government Gallery of Modern Masters, comprising paintings and sculptures executed since 1890, was opened. The Folklore Museum has been transferred to the former Schonborn Palace and the Ethnographical Museum to the New Hofburg. The Technical Museum of Industry and Manufacturing was opened in 1918, the Museum of Sociology and Economics in 1928, and the Museum of Building and Housing in 1929. The Albertina, the world's most famous collection of etchings, engravings, and lithographs, named after its founder, Duke Albert of Teschen, is housed in the former Palace of the Archduke Frederick. Since 1921 the Vienna Trade Fair has been held twice annually, in March and September, in the former imperial stables, certain rooms of the New Hofburg, and the gigantic exhibition hall of the Rotunda in the Prater, Vienna's famous park. The total area covers 245,000 square meters (393,000 square yards). An average of 125,000 buyers, 30,000 of them from 70 different countries, attend this fair regularly. The Monument of the Republic, with portrait busts of leading Austrian Socialists, was erected in 1928 in the Schmerling-Platz.

Vienna has retained its position as the banking centre of central and eastern Europe. In 1923 a new bank of issue (the Austrian National Bank) was formed for the purpose of carrying through plans of stabilization of the crown and of insuring its permanence. The housing programme on which the municipality, under its socialist officials, embarked in 1923 has aroused world-wide admiration. By 1932 a total of more than 60,000 apartments in the working-class quarters of the city will have been constructed. The houses, built around garden courts, are beautiful architecturally and provide improved living conditions for the families of thousands of industrial workers. The garden groups of the Lainz poorhouse, the Steinhof lunatic asylum, the tuberculosis hospital, the trade schools, the Amalienbad (public baths), the founding relief station, and other institutions bear witness to an interest in public welfare formerly unknown in Vienna. The city is one of the most important traffic centres of Europe and is the junction of eight international air lines. Its aerodrome at Aspern stands on the spot where Napoleon suffered his first defeat in 1809.

VIERNE, LOUIS-VICTOR-JULES (1870-). A French organist and composer, born at Poitiers. He studied the organ under Franck and Widor at the Paris Conservatoire and graduated in 1894 as winner of the first prize. In 1900 he became organist at Notre Dame in Paris and professor of organ at the Schola Cantorum. Numerous recitals in Paris and tours of France, Switzerland, the Netherlands, England, Spain, and Portugal established his reputation as one of the greatest living masters of the organ. He wrote a symphony and *Suite Bourguignonne* for orchestra; *Praenios, Princesse d'Égypte* for soli, female chorus, and orchestra; *Messe Solennelle* for chorus and orchestra; a string quartet, a violin sonata and a cello sonata; five symphonies and numerous other works for organ; sacred music; piano numbers; and songs.

VILDRAC, CHARLES (1882-). A French poet and dramatist. His *Le Paquebot Tenacity* (1920) was one of the more popular plays at the Vieux Colombier Théâtre, and was played in the United States in 1922. With Jules Romains and Duhamel, he was a member of the *Unanimité* group. His poems were *Chants du désespéré, 1914-1920* (1920), and *Poèmes de l'Abbaye* (1928). As a playwright, he was objective, with an intuitive knowledge of correct proportions. Other plays include *Leon d'Amour*; *Michel Auclair*, played in the United States in 1925, and *Le pèlerin* (11th ed., 1923).

VILLA, VĚJĚ, FRANCISCO (PANCHO) (1877-1923). A Mexican revolutionary leader and bandit (see Vol. XXIII). In 1914 he raised a force of some 35,000 men to assist General Carranza against Huerta. After the defeat of Huerta, Villa quarreled with Carranza and, with the help of Zapata, caused Carranza to flee from Mexico City. In March, 1916, raiding Columbus, N. M., he killed 17 and wounded 7 Americans. This was the cause of the American expedition, under General Pershing, to capture Villa "dead or alive." Although overtaken at Guerrero and seriously wounded, Villa escaped. After that, his power declined, and on his promise to settle as a peaceful citizen, the Federals gave him \$2,000,000 for himself and his men, a small farm for each man, and a ranch for himself. His assassination near Parral, Mexico, on July 20, 1923, was attributed to the vengeance of a family some of whose members he had killed.

VILLAESPEA, FRANCISCO (1877-). A Spanish poet and dramatist. He excels in that most difficult genre, the sonnet. Among his principal works are *Intimidades, Tristitia rerum; El jardín de las quimeras, La copa del rey de Thule—La musa enferma* (1898-1900); *El alto de los bohemios: Rapsodias* (1899-1900); *Canciones del camino* (1906); *Carmen-cantares* (1907); *El espejo encantado* (1911), *El alcázar de las perlas: leyenda trágica* (play, 1912); *Era él* (1913); *Andaluza* (1913); *Judith, Biblical play* (1913); *Ajmeccas de ensueño* (1914); *Campañas pascuales* (1914); *Los nocturnos del Generalife* (1915); *El halconero, play* (1915); *La maja de Goya, play* (1915); *Baladas de cetrería y otros poemas* (1916); *A la sombra de los cipreses* (1917); *Doña Maria de Padilla, historical play* (1917); and *El milagro de las rosas-novela griega* (1917).

VILLAMOR, IGNACIO (1863-). A Filipino jurist, born at Bangued, Abra, P. I., and educated at San Juan de Letran College and in the law department of the University of Santo Tomas, both in Manila. From 1902 to 1907, he was judge of the Sixth Judicial District of the Philippine Islands and then Attorney General until 1913, when he became Secretary of State. He was president of the University of the Philippines (1914-18), and in 1920 he was appointed associate justice of the Supreme Court of the Philippine Islands. He wrote several books on law administration in the Philippines.

VILNA DISTRICT. This region, the northern zone of that long corridor which the Poles claimed as their rightful eastern boundary, was the scene of a long dispute between Poland and Lithuania which was not settled even after the line finally drawn by the Council of Ambassadors on Mar. 15, 1923, gave the district to Poland. Lying between Grodno on the south and Dvinsk on the north, with the city of Vilna at its centre, and possessing the important Warsaw-Vilna-

Dvinsk Railway section, the territory has an area of some 6000 square miles and a population put at 1,300,000. Of this, according to the Polish estimates, Poles totaled 25 per cent, although the pre-war census had put the figure at only 10 per cent. Besides Lithuanians, there were to be found here also White Russians, Jews, and Germans, and the racial and nationalistic loyalties of this diverse population made the demarcation of a just line practically impossible. At the Peace Conference, an attempt was made to cut the Gordian knot with the so-called Curzon line which kept almost rigorously to the confines of Congress Poland and left the Vilna district to Lithuania (accepted by the Supreme Council, December, 1919), but the settlement was deemed inadequate by almost all the Allies, including France and the United States, and was never observed by the Poles, who pushed into the disputed region and effectively occupied it. Not only was the hostility of the Lithuanians awakened (for they regarded the town of Vilna as the centre of their nationalistic aspirations) but the Russians were equally aroused. Here was the reason for the perplexing events of 1920.

Early in 1920, Poles massed against the Red armies, took Dvinsk, entered Vilna on April 20, and then pushed triumphantly across White Russia and captured Kiev on May 8. This was the high-water mark of Polish success and was followed by equally notable defeats. With the Poles in full retreat by July, the Supreme Council hastened to take action. The Spa Conference suggested that the Poles retire behind the Curzon line and broached the question of a general conference, but nothing came of it, and the Russian advance continued. Meanwhile Lithuanians had reentered Vilna and on July 12, a Russo-Lithuanian treaty ceded the disputed district to the Lithuanian government. By the end of July, the Russians were threatening Warsaw; in another two months, so bewildering were the reverses, the Poles had turned about, routed the Russian armies, and passed beyond Grodno, Brest-Litovsk, Kovell, and Luck. Vilna was again theirs. The attempt of the League of Nations Council to take a hand in the dispute proved a failure, for while on October 7 a League commission fixed a neutral zone leading to the city of Vilna and along a line running about forty miles north and south (the Suwalki agreement), two days later, General Zeligowski, at the head of a Polish irregular force, entered the city and claimed it for Poland. On Oct. 12, 1920, by the Treaty of Riga, Russia recognized Polish claims to the whole disputed zone on the east of Poland, including Vilna and stretching so far south as to take in the whole of eastern Galicia. The Poles took possession of Vilna at once and held a plebiscite in the city in January, 1922; this, proving favorable to Poland, was followed by the seating of the Vilna delegates in the Polish Parliament. On Mar. 15, 1923, the Polish occupation was legalized when the eastern boundary fixed by the Council of Ambassadors was made to follow the Treaty of Riga line on the east and to include the whole Vilna district on the northeast. See LITHUANIA, under *History*; POLAND, under *History*.

Kresy. By this name, the Poles designate the portion of the eastern corridor lying between Vilna and eastern Galicia and east of the Curzon line. Claimed by both Poland and Russia, it, too, was finally ceded to Poland in March, 1923. Made up of part of White Russia and the Ukraine,

with an area of some 43,000 square miles, this border region contained a population of some 3,700,000, of whom, according to the Poles, 32 per cent were Polish, while the pre-war Russian census showed a Polish population of only 6 per cent. This region was affected by all the happenings that influenced the fortunes of Vilna. It lay beyond the Curzon line; it was won, lost, and won again by the Poles in their operations against the Red Armies in 1920; it was yielded up to Poland by Russia as the result of the Riga Treaty; and finally in March, 1923, it was included in the Polish state by the decision of the Council of Ambassadors. With their customary despatch and with a complete disregard of the desires of the large racial minority living there, Polish officials proceeded to nationalize the annexed territory. The Polish language was substituted for the Russian; Polish peasants were colonized; the administration centres, in order to break the alien influence, were moved from such large cities as Grodno to cities of secondary importance such as Białystok and Novogrodek, the latter without even a railway connection, but the Kresy looked to Moscow as Vilna did to Kovno, and in spite of the fact that Soviet Russia, after October, 1920, made no attempt to regain these lost provinces, there was every reason for believing that the settlement had too many artificial elements in it to be lasting. The danger zones in the Polish system included almost half its 1929 area, i.e., Vilna, "Kresy," East Galicia, and Upper Silesia, where there were large irredentist groups in which Germany and Russia could not help being interested.

VINCENT, EDGAR FIRST BARON D'ABERNON. See ABERNON, EDGAR VINCENT D'.

VINCENT, HENRI JEAN (1862-). A French physician and professor of medicine, born at Bordeaux. A professor at the Collège de France, he conducted researches in medical and surgical tetanus and antitypho-paratyphoid vaccines which won him membership in the Academy of Medicine and the Academy of Science. He also served as inspector of hygiene and epidemiology in the French Army. He was made a Grand Officer of the Legion of Honor. His works which have had English translations include *Vincent's Angina*, *Infectious Diseases*; and *Anti-colicillary Serotherapy*.

VINOGRADOFF, vĕn'ō-gra'dōf, SIR PAUL (1854-1925). An English jurist and educator (see VOL XXIII), Corpus professor of jurisprudence at Oxford (1903-1925). In 1917 he was knighted for his work as a liaison officer between England and Russia. He lectured at the University of Leyden (1921), and at various American universities (1923). He received numerous honorary degrees, was a member of many European academies, and was director of the British Academy publications on social and economic history. He edited *Oxford Studies in Social and Legal History* (1909-21) and the Russian section of the Carnegie Endowment Fund *Social and Economic History of the War* (1914-17). He wrote *Self-Government in Russia* (1916); *Historical Types of International Law* (1923); and *Custom and Right* (1925). Consult *Paul Vinogradoff: a Memoir*, by the Rt. Hon. H. A. L. Fisher (1927).

VÍQUEZ, CLETO GONZÁLEZ (1858-). A President of Costa Rica, who was born in Barba, Province of Heredia, and educated in the College of Law there. In addition to a successful legal career, he served as a member of Congress and

at various periods held the portfolios of Finance, Foreign Affairs, Promotion, and Interior. He was President of the Republic in 1906-10 and was reelected in 1928 for the term ending in 1932. During his public life, he secured the enactment of a number of important legislative and administrative reforms. He is the author of several works on history and finance and of *Temblores, terremotos, inundaciones y erupciones volcánicas en Costa Rica 1608-1910* (1910).

VIRGINIA. The thirty-third State in size (42,627 square miles) and the twentieth in population; capital, Richmond. The population increased from 2,061,612 in 1910 to 2,309,187 in 1920, a gain of 12 per cent; estimated population, 1928, 2,575,000. White population increased from 1,389,809 (1910) to 1,617,909 (1920), Negro, from 671,096 to 690,017; native white, from 1,363,181 to 1,587,124; and foreign-born white, from 26,628 to 30,785. Both urban and rural populations rose, the former from 476,529 to 673,984 and the latter from 1,585,083 to 1,635,203. The growth of the principal cities was as follows: Richmond (q.v.), 1910, 127,628; 1920, 171,667; Norfolk (q.v.), 67,452 to 115,777; Portsmouth, 33,190 to 54,387; Roanoke, 34,874 to 50,842.

Agriculture. Although Virginia is one of the cotton-producing States, only a small part of the farm area is devoted to cotton cultivation and, consequently, the State has not suffered much from the ravages of the boll weevil and other destructive insects as have the States farther south. The weevil did not reach the State until 1922 and on account of the cold winters was not a serious menace. The production of cotton was, with the exception of one or two years, comparatively stable. In 1913 the acreage was 47,000 and the production 23,000 bales; 1920, 42,000 and 22,000; 1922, 55,000 and 27,000; 1928 (estimated), 79,000 and 44,000. The number of farms increased only 12 per cent, or from 184,018, in 1910 to 186,242 in 1920, but rose thereafter to 193,723 in 1925. The total acreage in farms decreased from 19,495,636 (1910) to 18,561,112 (1920) and 17,210,174 (1925). The improved land in farms totaled 9,460,492 acres in 1920. The total value of farm property rose by 91.4 per cent, or from \$625,065,383 in 1910 to \$1,196,555,772 in 1920, but declined moderately to \$999,465,839 in 1925; the average value per farm was \$3397 in 1910, \$6425 in 1920, and \$5159 in 1925. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. The percentage of the total area in farms was 75.7 in 1910, 72 in 1920, and 66.8 in 1925. Of the total number of farms in 1925, 143,587 were operated by owners; 1238, by managers; and 48,898, by tenants. The comparative figures for 1910 were 133,664; 1625; and 48,729, respectively. There were 138,456 white and 47,786 colored farmers in 1920; 143,576 white and 50,147 colored in 1925. Farms reported as under mortgage, 24,331 in 1920, numbered 27,075 in 1925. The total number of cattle was 909,795 in 1920; 806,524 in 1925; there were 509,304 dairy cows in 1920, 291,651 in 1925. Sheep numbered 342,367 in 1920; 350,850 in 1925; swine, 941,308 in 1920; 582,193 in 1925. The estimated production of the principal farm products in 1928 was as follows: Corn, 45,155,000 bushels; wheat, 9,758,000; oats, 4,641,000; barley, 9,758,000; potatoes, 21,593,000; sweet potatoes, 6,336,000; tobacco, 111,600,000 pounds, and hay, 1,479,000 tons. For cotton, see above.

Comparative figures for 1913 are corn, 51,480,000 bushels; wheat, 10,608,000; oats, 4,192,000; barley, 286,000; potatoes, 9,870,000; hay, 952,000 tons; and tobacco, 154,000,000 pounds.

Mining. The chief mineral products of the State are coal, clay, stone, and cement. Of these, coal is by far the most important. The progress of coal mining in the period starting with 1914 is indicated by the following production figures: 1914, 7,959,535 net tons; 1916, 9,707,474; 1917, 10,087,091; 1918, 10,280,808; 1920, 11,378,606; 1921, 7,492,378; and 1922, 10,491,174; 1926, 14,133,386. The value of the clay products ran between \$2,000,000 and \$4,000,000 annually. The State also produces iron ore, sand and gravel, and gypsum. The total value of mineral products in 1926 was \$46,136,458, compared with \$60,161,247 in 1920; \$36,799,407 in 1919; \$37,639,368 in 1918; and \$16,400,347 in 1914.

Manufactures. Virginia showed considerable increase in manufacturing after 1909. In 1920 there were 11 cities having more than 10,000 inhabitants. These formed 23.8 per cent of the total population and in 1919 produced 52.2 per cent of the value of the State's manufactured products. In 1909 there were in the State 5685 manufacturing establishments; in 1919, 5603; and in 1925, 2553. Persons engaged in manufactures numbered 120,797, 119,352, and 112,136, respectively; the capital invested amounted to \$210,392,388 in 1909 and \$463,644,498 in 1919. The value of the manufactured product amounted to \$219,793,858 in 1909; \$643,511,621 in 1919; \$589,511,000 in 1925; and \$730,461,810 in 1927. The increase in value of products in and about 1919 was largely due to the change in industrial conditions brought about by the World War and cannot properly be used to measure the growth of manufactures during the period. The first industry in point of value of products is the manufacture of tobacco. In 1909 this amounted to \$25,385,000; in 1919, to \$78,350,000; in 1925 were produced 460,000,000 cigars, 10,229,406,903 cigarettes, and 21,639,123 pounds of other tobacco. In 1927 the value of the output was \$182,071,911. Lumber and timber products attained \$35,855,000 in 1909; \$56,394,000 in 1919; \$23,895,561 in 1925. In 1927 Virginia had 41 industries with an output in excess of \$3,000,000 each, tobacco, as stated, having first place. Others in order were, iron and machinery, \$32,071,124; shipbuilding, \$31,745,895; mining, \$31,379,206; cotton-mill products, \$30,380.99; silk-mill products, \$29,640,382; railroad shops, etc., \$28,578,074; paper and pulp mills, \$27,571,434; automobiles, \$24,668,520; furniture, \$23,199,968; and flour- and grist-mill products, \$20,419,833. The chief manufacturing city was Richmond (q.v.). In 1909 its manufactured products were valued at \$47,358,000; in 1919, at \$156,724,000; and in 1925, at \$157,450,000.

Education. The progress of education in Virginia has been marked by important steps in recent years. The Legislature, in a succession of its sessions, has passed several important laws which greatly assisted the administration of the school system. The Assembly of 1922 enacted three important educational bills, covering compulsory education, the county-unit system of school administration, and the adoption and distribution of textbooks. The compulsory-education law was greatly superior to that previously in force. The county-unit law became effective in September, 1922. Negro education is a problem in Virginia, as in other Southern States, but

in this phase of education also there was progress. Twenty-three county training schools were devoted to the needs of Negroes, and from the Julius Rosenwald Fund, nearly 160 public schools were built for colored people. Vocational work under the Smith-Hughes Law was established in 1917-18, including vocational agriculture, vocational home economics, and trade and industrial education. In 1922-23, 53 of the 100 counties of the State were provided with training in vocational agriculture. The work in trade and industrial education, which was meeting with considerable success, was intended to serve pupils enrolled in public schools, those already engaged in industry, who could give a part of their time to industrial class work, and others. Notable progress also was made in the programme of health and physical education. Approximately 75 per cent of the pupils in the schools received physical inspection under the general direction of the State Board of Health and the State Board of Education in 1922-23. The public-school enrollment in the State increased from 474,210 in 1915 to 551,475 in 1925-26; of this total, 481,799 were enrolled in kindergarten and elementary grades and 69,676 in high schools. Colored enrollment contributed to the total 147,245 in elementary and 5729 in secondary grades. Expenditure for public day schools was current, \$17,628,569; outlays, \$4,126,869. The percentage of illiteracy in the State decreased from 17.9 in 1910 to 13.5 in 1920. In the native white population, from 9.4 to 7.1 per cent; in the foreign-born white, from 9.3 to 7.5; and in the Negro, from 37.1 to 29.3.

Finance. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, was for maintenance and operation of State departments, \$23,762,635 (of which \$5,710,371 was aid to local education); for interest on debt, \$763,839, for permanent improvements, \$12,758,777; total, \$37,285,251 (of which \$15,711,805 was for highways, \$5,176,483 being for maintenance and \$10,535,322 for construction). Revenue was \$38,995,736. Of this, property and special taxes formed 35.1 per cent; departmental earnings and charges for officials' services, 9.6 per cent; sales of licenses and taxation of gasoline, 39.8 per cent. Property valuation was \$765,373,554; State taxation thereon, \$5,877,960, intangible property alone being taxed. Net funded State debt on June 30, 1927, was \$26,637,392.

Political and Other Events. In 1914 a measure providing for State-wide prohibition was adopted by the people. In 1916, 1922, and 1928, Senator Claude A. Swanson was reelected. For President, in 1916 Wilson received 102,824 votes; Hughes, 49,256. On Mar. 1, 1916, the prohibition law went into effect. In 1917 the Democratic candidate for governor, Westmoreland Davis, was elected. Senator Martin was reelected in 1918. He died in 1920, and Carter Glass, Secretary of the Treasury, was appointed to fill his unexpired term. For President, in 1920 Cox received 141,670 votes; Harding, 87,458. The Democratic candidate for governor, E. Lee Trinkle, was elected in 1921. For President, the vote in 1924 was: Davis, 139,797; Coolidge, 73,359; La Follette, 10,379. Harry F. Byrd, Democrat, was elected governor in 1925. He carried out a programme of fiscal reform, in co-operation with the General Assembly. A movement progressed in 1927 and 1928 to acquire a part of the Blue Ridge to form a Shenandoah

National Park. In 1928 the vote of the State for President was: Hoover, 164,609; Smith, 140,146.

Legislation. The Legislature of 1918 passed measures regulating the practice of women at law. A general prohibition law was passed and a commission was appointed to study the educational system of the State. Laws regulating the labor of women and children were amended, and an elaborate measure was enacted relating to safety in industry. A new workmen's-compensation law also was passed. In 1918 the Legislature passed a law providing for a budget. In 1922 the Legislature amended the laws relating to labor and the workmen's-compensation law and passed a motion-picture censorship bill. In 1923 a special session of the Legislature was held, when it passed a series of acts relating to highways and motor vehicles and enacted a measure designed to prevent the operation of "rings" among bidders for State work. During the regular session of 1924, the Legislature passed an act regulating more rigidly the operations of the Virginia Pilot Association, which, up to that time, had been a powerful political factor in the State. In 1926 measures sought by Governor Byrd to transfer the taxation of land values to the counties solely and reserve taxation of intangibles to the State were enacted. An amendment to the State constitution, restricting elective State officers to three, was passed in the sessions of 1926 and 1928.

VIRGINIA, UNIVERSITY OF. A nonsectarian institution of higher learning at Charlottesville, Va., founded in 1819. The student enrollment, including the summer quarter, for the academic year 1913-14 was 2138, as compared with 4890 in 1928-29. The faculty in 1914 comprised 103 teachers, in 1928, 290. During this period, the institution received from Paul Goodloe McIntire \$200,000 to found a school of commerce and business administration, \$150,000 to found a school of art, now known as the McIntire School of Fine Arts; \$70,000 for an amphitheatre and outdoor organ, \$50,000, to which other donors added \$115,000, for two wings to the hospital, and \$118,000 from John B. Cobb for the Cobb Chemical Building and Laboratory, besides \$300,000 for a new gymnasium from students, alumni, and others. The library contained approximately 140,000 volumes in 1928. President, Edwin Anderson Alderman, Ph.D., D.C.L., LL.D.

VIRGIN ISLANDS. An American dependency in the West Indies, consisting chiefly of the islands of St. Thomas, St. Croix, and St. John's. Total area, 132 square miles. The United States took possession of these islands, following their purchase from Denmark for the sum of \$25,000,000, on Mar. 31, 1917. In that year, the population was placed at 26,051. Subsequent partial population surveys indicate a decrease, ascribed to emigration. Of the total population, 80 per cent is Negro, 13 per cent, of mixed race, and 7 per cent, white.

Production. Agriculture was formerly the chief industry of the islands, but, after the abolition of slavery, the laboring classes showed a tendency to concentrate about the ports. Some 70,000 acres were devoted to agriculture in 1917. In 1920 there were 430 farms, 102 worked by white farmers and 270, by Negroes. Sugar cane is the chief product. In 1917 about 9000 acres were devoted to it, the production being valued at about \$440,000. Sugar exports in 1928-29 were valued at \$669,398. The total value of farm products in 1917 amounted to \$3,706,911.

Other products were vegetables, cotton, bay rum, fruits, and nuts. The value of all crops in 1917 was \$522,006. The production of bay rum in 1928-29 was 91,116 gallons. Shipments of cattle to Porto Rico were increasing.

Commerce. The value of the Virgin Islands to the United States principally lies in their geographic location and their exceptional harbor facilities rather than in their commercial and agricultural interests. The chief exports are sugar, hides, skins, and cabinet woods. Prior to the enactment of the United States Prohibition Amendment, there was a large export of rum, and the cutting off of this source of revenue had a very serious effect on the economic condition of the islands. Exports to the United States in 1917 were valued at \$1,259,607. In 1927 they were but \$968,463. Imports from the United States in 1917 amounted to \$1,416,342 and, subsequently rising, reached \$2,053,340 for 1927.

Education. Education is compulsory. The total enrollment in the public schools of the islands was 2950 in the year 1928-29. The appropriation for education in the latter year was \$95,269. Junior high schools and a summer school for teachers have been established and night schools opened in several of the larger towns. Manual-training schools also have been established.

Transportation and Communication. Regular transportation has been maintained between the islands and New York City. Each municipality had a post office, cable office, and telephone system. The naval station at St. Thomas has a powerful radio station. There is also a naval station on the island of St. Croix. A weekly air-mail service from San Juan, Porto Rico, was inaugurated in 1929. In 1928-29, 655 ships of a total gross tonnage of 2,651,397 entered the Harbor of Saint Thomas.

History. The islands are administered by the U. S. Navy Department. The governors have been Rear Adm. James H. Oliver (1917-19), Rear Adm. Joseph W. Oman (1919-21), Capt. Sumner E. W. Kittelle (1921-23), Capt. H. H. Hough (1923), Capt. Philip Williams (1923), Capt. Waldo Evans (from 1927). By the Organic Act of Mar. 3, 1917, the United States Congress vested all military, civil, and judicial powers in a governor appointed by the President and continued in force the Danish code under which the islands had been governed. Citizenship was held by males over 25 possessing an annual income of 1500 francs. Criticism was frequent in the United States on the despotic character of the American administration. It was charged that Americans, unlike their Danish predecessors, refused to fraternize with the Negroes, that free speech was being suppressed, and local leaders proceeded against summarily. On another ground, there were complaints in many quarters that the American officials were doing nothing to aid the economic development of the islands. The exceptionally severe hurricane of September, 1928, did great damage to the islands.

VISION. In the field of vision, Prof. L. T. Troland brought together, in a monograph published by the National Research Council (*Bull.*, vol. v, no. 27, December, 1922), the available experimental data on the "Present Status of Visual Science." Passing lightly over the theories of color vision, he concentrated his attention on the psychophysics of vision. He reduced the introspective attributes of color to brilliance, saturation, and hue, the last two being included in

the term "chroma." Each of these attributes can be correlated with the wave length, intensity, and purity of the light stimulus. Troland also made a similar analysis of the perception of forms and of things in motion, first separating the introspective conditions from the physical and then proceeding to work out psychophysical relationships between them.

These relationships or functions he sought to divide among the several stages of visual response. For instance, he assigned such effects as scotopic and photopic adaptation to the receptors, while other effects, such as Carpentier's bands, he attributed to the afferent conduction, with still others, like motion perception, belonging to the cortex. These relationships hold between the stimulus and the visual consciousness, but in some instances, according to Troland, "we are actually able to establish empirically the relationships between visual consciousness and stages in the response other than the stimulus." He went on to say that "this is particularly true with respect to the central process itself. The disturbances of vision which accompany lesions in the occipital lobe of the cerebrum demonstrate clearly the fact that the totality of the visual consciousness depends psychophysically upon the brain process; so that relations such as those studied in the majority of laboratory experiments, between consciousness and the stimulus, must be explained in terms of the physiological mechanism of the response, leading up to the focal region in the cortex, as well as by the direct psychophysical relation which exists between consciousness and the cortical activity in question."

Professor Troland's monograph contains a detailed bibliography of 268 titles, to which we refer the interested reader.

In the field of color vision, Hecht has been able to produce binocular fusion of colors, red and green giving yellow, and blue and yellow giving white. Hecht overcame the difficulties met by Helmholtz and others in obtaining binocular fusion through the use of special filters. Successful fusion was obtained in all persons who had normal color vision. These findings offer serious difficulty for those color theories that assume special receptors for yellow and white and lend new support to the old Young-Helmholtz theory of color vision. *Proceedings of the National Academy of Sciences*, 1928, p. 237.

The immense number of brain lesions suffered during the War has given rise to an extensive series of investigations and reports on the relation between brain structure and visual function. A recent review of this literature (H. Kluver, "Visual Disturbances after Cerebral Lesions," in *Psychological Bulletin*, 1927) contains 271 titles, and this is by no means a complete survey.

One of the outstanding events of the present decade is the publication of an English translation of Helmholtz, *Physiologische Optik*, 3 vols., under the editorial direction of J. P. Southall. After nearly three-score years, this famous work has at last become directly accessible to English readers. A review of the recent literature on visual sensations will be found in the *Psychological Bulletin*, 1928, p. 20. See PSYCHOLOGY, EXPERIMENTAL.

VITAL STATISTICS. The movement of population after 1914 was temporarily perturbed by the years of war and pestilence, 1914-19. After this period, the birth and death rates be-

came stabilized, but further confusion resulted from the formation of new States, so that figures available for Russia, the Balkans, Greece, and some of the new national states of Europe are not always on a basis comparable with the years before the war. A recent compilation of death rates of the leading nations of the world is given herewith and is of interest.

DEATH RATES OF VARIOUS COUNTRIES IN RECENT YEARS

Countries	Years	Death rate
New Zealand	1926	8.7
South Australia	1926	8.7
Western Australia	1926	8.9
Queensland	1925	8.9
Tasmania	1926	9.1
New South Wales	1925	9.2
Australia	1926	9.4
Victoria	1925	9.5
Union of South Africa (Whites)	1926	9.6
Netherlands	1926	9.8
Uruguay	1926	10.5
Norway	1926	10.6
Denmark	1925	10.8
Panama	1923	11.0
Canada	1927	11.1
Germany	1926	11.5
England and Wales	1926	11.6
Switzerland	1926	11.7
Sweden	1926	11.8
Prussia	1925	11.9
United States (Reg. Area)	1928	12.1
Belgium	1926	12.8
Iceland	1923	12.8
Scotland	1926	13.0
Finland	1926	13.4
Greece	1921	13.8
Quebec	1927	13.9
Irish Free State	1926	14.1
Newfoundland	1923	14.2
Latvia	1924	14.8
Argentina	1921	14.8
Austria	1926	14.9
North Ireland	1926	15.0
Estonia	1924	15.2
Czechoslovakia	1925	15.2
Hungary	1926	16.6
Italy	1925	16.8
France	1926	17.5
Spain	1926	19.0
Japan	1926	19.2
Bulgaria	1924	20.7
Rumania	1925	21.0
Jamaica	1925	21.4
Ceylon	1926	24.7
British India	1925	24.7
Egypt	1925	26.2
Chile	1925	27.6

Deaths. While the gross death rate is available for the regions enumerated, the figures often possess very limited value; for infant mortality, as well as deaths by ages and sex, they are not separately given, and there are no means for determining the reasons for the great disparities of mortality in different countries. Under a similar civilization, the death rate of Chile is nearly double that of Argentina; the mortality of Scotland is sensibly higher than that of England and Wales. The death rate is notably higher in France than in Germany and Great Britain and much higher in Spain than in Italy. In most of the statistics, the population on which the death rate per 1000 is computed is only an estimate. Hence, the percentages are only approximations. The lowest figures are supplied by New Zealand, with a death rate between 8 and 9 per 1000 inhabitants, and Australia with 9.4; at the other extreme stands Chile, with more than 27. Other very low figures are furnished by the Netherlands and Denmark, with 9.8 and 10.8, respectively. England and Wales show slightly below 12, while Switzerland has between 11 and 12, and the death rate for the whole of Canada was 13.74 for the year 1921 but fell to 11.1 in

1927. Germany shows a mortality of 11.5, which is slightly below that of England and Switzerland. The figure for Italy is 16.8, that for France, 17.8. Austria and Argentina have about 14.8.

Death rates above 18 are shown by Spain with 19 and Japan with 19.2. Figures available for tropical countries are not numerous. Further figures could be supplied, but as already stated, the lessons of these crude statistics are not obvious. They may be contrasted, however, with death rates in the United States for 1928.

Statistics for 1928 show a death rate of 12.1, as compared with 11.4 for 1927 and increases were reported in 36 of the 38 States. The highest 1928 death rate (14.5 each per 1000 population) is shown for California and Mississippi and the lowest rate (7.4) is for Idaho. The figures by States are given in the accompanying table.

On Dec. 30, 1927, the figures of mortality for the registration area of the United States for 1925 and 1926 were released and showed a slight increase over 1924, the rate for 1926, 12.2, being a trifle more than for 1925. The figures for 1925 and 1926 show an increase for heart disease, cancer, influenza and pneumonia, nephritis, and whooping cough over previous years, while there were fewer deaths from intestinal ailments, including typhoid fever. In 1926 the list was headed by about 233,000 deaths from

diseases of the heart and arteries; pneumonia, influenza, bronchitis, whooping cough, measles (broncho-pneumonia), and other acute respiratory diseases claimed over 175,000 victims; nephritis totaled 103,332 deaths; and cancer, 99,833. Tuberculosis, believed to be receding, caused 91,568 deaths, as against 89,268 in 1925. Apoplexy shows a gain, with 90,382. Diabetes, despite radical innovations in treatment, with 18,881 deaths in 1926, shows an increase over 1925. Appendicitis, despite much life-saving from operation, shows no decrease in mortality.

In a subsequent bulletin dealing with the principal causes of death in 1928, the Bureau of the Census announced that 1,378,675 deaths occurred in 1928 in the registration area in continental United States, corresponding to a death rate of 12.0 per 1000 population, as compared with 11.4 in 1927. This area in 1928 comprised 44 States, the District of Columbia, and 10 cities in non-registration States, with an estimated population on July 1 of 114,495,000, or 95.4 per cent of the population of the United States. In 1927 the registration area included only 91.3 per cent of the total population.

Increases in rates (per 100,000 population) from those of the preceding year, were from the following principal causes. diseases of the heart (195.7 to 207.7), cerebral hemorrhage and soft-

^a Exclusive of stillbirths

^b Includes tabes dorsalis (locomotor ataxia) and general paralysis of the insane

^c Includes airplane, balloon, and motor-cycle accidents.

ening (84.0 to 37.0), nephritis (92.5 to 95.0), diabetes mellitus (17.5 to 19.0), cancer (95.6 to 95.9), influenza (22.6 to 45.2), and pneumonia, all forms (80.5 to 98.0). The deaths from these causes numbered 741,739, which is considerably more than half the total number of deaths from all causes. Increases in rates were for measles (4.1 to 5.4); pellagra (5.0 to 6.1).

The death rate from all accidental causes increased from 78.4 to 79.2, the individual types of accidents showing the greatest increases being accidental drowning (6.7 to 7.1), and automobile accidents, excluding collisions with railroad trains and street cars (19.5 to 20.8); if deaths from these collisions were included, the

total number from automobile accidents in 1928 would be 26,348 as compared with 23,312 in 1927. The corresponding rates (per 100,000 population) for 1928 and for 1927 are 23 and 21.4.

Significant among the decreases in rates from 1927 to 1928 were those from tuberculosis, all forms (80.8 to 79.2), congenital malformations and diseases of early infancy (67.7 to 65.6), whooping cough (6.9 to 5.4), diarrhea and enteritis, under 2 years (21.6 to 20.7), acute anterior poliomyelitis (1.9 to 1.2), typhoid and paratyphoid fever (5.5 to 4.9), and scarlet fever (3.3 to 1.9). The death rate from railroad accidents decreased from 6.4 to 5.9 and from mine accidents, from 2.5 to 2.3.

The study of mortality figures in the United States seems to indicate that notwithstanding the remarkable progress in public health practices and in medicine during the last century, the span of human life cannot be considered lengthened. Dr. Louis I. Dublin of the Metropolitan Life Insurance Company, in a paper presented to the American Public Health Association in 1929, submitted a study of the mortality figures since 1920 among the general population of the United States and among the insured of the Metropolitan Life Insurance Company. Dr. Dublin's conclusions were that a decreased ability for people to live much longer than 65 years was apparent. In this paper he stated:

The expectation of life has increased, but the span of life has remained stationary. A fundamental distinction must be made between the two. The former, which is the average length of life of people in a stationary population, has shown appreciable gains and will continue to increase as public health improves and more and more diseases are brought under control. The latter has remained stationary for a long time and it is altogether unlikely that man will be able to do anything to change it. The span of life seems to be fixed by the nature of man himself. His internal structure wears out after so many years of work and use and he appears unable to master its weakness or give it stamina to last longer.

That twenty years have been added to the average length of human life since public health work began to be actively practiced in the early eighties of the last century is true. But this gain can be traced to the reduced mortality of infants and to the cutting down of the unnecessary and preventable deaths of young people from typhoid fever, diphtheria, scarlet fever, smallpox, and a host of other diseases which for the most part affect persons under forty years of age. Improvement, after age forty, has been slight and almost altogether limited to women. This lack of improvement is all the more striking in view of the great effort that has been made to interest those in middle life in the conditions of their health. Such campaigns as center around the physical examinations are very desirable, but their value, so far as they go to extending the life span, is questionable. Their greatest worth is in making old age freer of discomfort.

Dr. Dublin was of the opinion that more babies would survive the perils of infancy and childhood and grow to be men and women, but the grown men and women today would die at the same age as they did a century ago.

Age and Sex. The United States Census Bureau issues two sets of mortality figures, one termed "crude" and the other "adjusted" by reason of its corrections for age and sex groups. Separate figures for sex and age, aside from infant mortality, are not supplied. In other countries, only crude figures appear to be given, with the occasional exception of infant mortality.

Infant Mortality. Figures under this head are difficult to obtain. In Great Britain, the infant mortality had dropped from the 1903 figure of 133 per 1000 to 70 per 1000 in 1926. In the United States, the death rate during the first year of life in 1924 was about 76 for the entire registration area; while in 1928 it had declined to 67.7. Even this low figure has been surpassed in Western Australia, where a minimum of 37.16 deaths per 1000 was attained in 1927. These figures of infant mortality vary, some reports including, and others excluding, stillbirths, but, in general, the figures apply only to live births. The superior figures in certain countries are due in part to natural conditions but very largely to intensive child-welfare campaigns.

For the registration area of the United States for 1926, the death rate in early infancy was 71.5, as against 73.9 in 1925. The infant-mortality rate for 1928 represents an increase as

compared with 1927, the rates being 67.7 for 1928 and 64.6 for 1927. The highest infant-mortality rate (142.2) is for Arizona and the lowest (46.9) for Oregon. Infant-mortality rates were compiled for both years for 54 cities of 100,000 population or more in 1920. For 39 of these cities, the 1928 infant-mortality rates were higher than those of the previous year, the highest 1928 rate (99.3) being for Nashville, Tenn., and the lowest (42.7) for Seattle, Washington.

Marriages. This subject is of some special interest in connection with the decimation of the peoples of the warring countries and the discussion of a declining birth rate. In France, the anticipated increase in the marriage rate reached its high mark in 1920, with 623,869, and fell in the next year to 456,221, declining to 337,864 in 1927. The number of German marriages in 1927 was 538,525. In England and Wales, the number of marriages for 1926 was 279,860, in 1920 it was 379,982, and in 1919, declined to 369,411. The figures of the Department of Commerce of the United States do not appear to take cognizance of the number or rate of marriages per annum, but bulletins which cover the married state are occasionally released and one of these issued in 1922 gave the status of the married and single for 1920. Of 36,900,663 males over 15 years of age, 21,849,266 were married, and

^a Number of births per 1000 of the mean population.

^b Figures for "provisional birth registration area," which includes about 76 per cent of the population.

1,758,308 were widowers, while 235,285 were divorced. Of 35,177,515 females over the age of 15, 21,318,933 were married at the time; 3,917,625 were widows, and 273,304 were divorced. The number of single males over 15 was 12,967,565; single females, 9,616,902. The number on

whom information could not be obtained concerning the married state was 110,240 males and 50,751 females. The largest proportion of married men was found in Mississippi and Arkansas and the smallest in Nevada, percentages varying between 62.8 and 45.9. In 1926 the total number of marriages in the United States was 1,202,574. See DIVORCE.

Births. Figures on births and excess of births over deaths are found in the same frequency as death reports. A few of these follow. Argentina in 1927 had 308,689 births, an excess of nearly 173,000 over the deaths; the rate was about 31.1 per 1000. In Australia, the surplus of births over deaths in 1927 was 75,416; the birth rate, about 21.7. The surplus in Austria was 21,000; the birth rate, about 17.8. In the whole of Canada, the surplus for 1921 was about 135,000; the rate, between 29 and 30. In France in the same year, the excess of births was 117,000, and the birth rate was 18.10. By contrast, the surplus of births in Germany for the same year was nearly 700,000 and the rate was over 18.3.

In Great Britain, the surplus in England and Wales for 1922 was 294,000; in Scotland, 43,000; and in Ireland (1921), 27,000. The birth rate for England and Wales was over 25; that of Scotland, 23; and that of Ireland, over 24. In Italy, the surplus was over 461,000, the birth rate, about 28. The surplus and birth rate signify little in the absence of data covering infant mortality, which commonly varies directly with the birth rate.

The general birth rate of the United States for 1922 was 22.7, which represented quite a falling off from the preceding year, when it was 24.3. The surplus of births over deaths was 720,000. The highest birth rate was in Wyoming cities with 34.4; lowest, in rural Washington (17.3). Japan has a high birth rate, about 35, but its surplus was not correspondingly large in comparison with Germany, the latter had almost as large an excess, with a much lower birth rate. The U. S. Bureau of the Census announced in 1929 that for the birth-registration area, the birth rate for 1928 was 19.7, as compared with 20.7 for 1927. In 35 of the 40 States for which figures for the two years are shown in the accompanying table, the birth rates, were lower in 1928, as compared with 1927. The highest birth rate in 1928 (27.5 per 1000 population) is shown for North Carolina and the lowest (14.4) is for Washington.

Birth Control. Does birth control tend to lower the number of births and the birth rate? The only evidence thus far is supplied by Holland and gives a negative answer. In 1927 the excess of births over deaths was 97,484 and the birth rate 23.1, which is high for a state with high civilization; in some years, this rate was even higher. In 1916 it was 31. See BIRTH CONTROL.

VITAMIN, or VITAMINS (also VITAMINE). Since their discovery in 1909, the vitamins have never been isolated. Because of their occurrence in yeast, a substance long reputed to have medicinal properties, vitamin, or rather yeast, was urged vigorously by yeast manufacturers as a universal panacea. The subject of vitamins remains of absorbing interest and many monographs on it have appeared. Originally, as discussed under FOOD AND NUTRITION, there were three of these bodies, absence of any one of which from the diet was known to entail the development of a so-called deficiency disease. If the

water-soluble, or B, vitamin is lacking, the disease beriberi develops; and if the fat-soluble, or A, vitamin is deficient, a peculiar affection of the eyes results. Both these affections are little known in America and Europe. If, on the other hand, the C vitamin is missing, scurvy develops; in civilized, temperate-zone countries, it is prone to attack young children. It is, however, easily prevented and cured by the use of fresh fruits, fruit juices, and tomatoes.

It was learned during the World War that famine conditions do not necessarily lead to the development of these deficiency diseases, because the cheapest and commonest foods usually contain sufficient vitamins; the only real danger lies in the use of a monotonous diet, such as peeled rice or preserved foods. Deprivation of vitamins in the growing child would in theory mean death or stunting, but as a matter of fact the only deficiency disease actually and constantly encountered is infantile scurvy. The original number of known vitamins has recently been increased by others, the absence of which from the diet may, perhaps, in conjunction with other factors, be a cause of rickets. (See RICKETS.) In May, 1924, Prof. Walter H. Eddy of Columbia University announced the isolation in pure state of Vitamin D, a study of which reveals its identity with a substance known as Wildier's Bios, a sort of forerunner of the vitamins, which dropped out of sight after their discovery.

Professor C. Funk, now of Warsaw, the discoverer of vitamins, has recently summed up our present knowledge of these substances in an abstract published in the *Revue de médecine* for 1928, No. 5. Vitamins are essential to the proper growth and development of the skeleton, as shown in the disease, rickets. The word "vitamin" was evidently formed by Funk because of the resemblance of the action of this class of substances to certain amines, and, for the same reason, he prefers to term the anti-rachitic vitamin a vitasterin because of the similarity of action between this substance and ergosterin. Vitamin D, or, as he prefers to call it, vitasterin D, presides over the calcification and harmonious growth of the bones and, as he also believes, of the teeth as well. Funk believes that some of the epidemic and endemic maladies, in the last analysis, may depend on some defect in the diet and cites the influenza epidemic of 1918-19, which developed when the world was on rations. Tuberculosis and leprosy also stand in some relationship to defective diet, while cancer, diabetes, and gout result from overfeeding. Naturally, the problem is a complicated one, for there are other organic growth agents besides vitamins—certain amino-acids, for example; there must be mineral matter for skeletal and other growth and, finally, the internal secretions, or hormones, also stand in close association with growth and development.

The subject is in a transitional stage and some of the statements of past years may require a radical modification. The present count comprises the vitamins A, B, C, of the textbooks, with the addition of D, which is associated in some way with the disease rickets, and E, which is concerned only in reproduction among certain small laboratory animals. To these may be added a so-called vitamin X, which is believed to play a rôle, through its absence, in the genesis of pellagra. Naturally, this sort of innovation will end in a *reductio ad absurdum* or else all of our knowledge will have to be revised.

The dietum that vitamins are formed only in the plant world and that the animal, including man, must get his vitamins either from the plants themselves or from animals who directly or indirectly subsist on plants, seems likely to be overthrown, for some evidence is forthcoming that animals on a vitamin-free diet can manufacture these bodies in their intestines from the sterile food. There is some reason for the belief that pregnant women, if fed on a vitamin-rich diet, are less likely to abort and more likely to bear well-developed and healthy children. Under favorable conditions, the new-born babe has a store of vitamins, but this is soon lost if the nourishment is deficient in this respect. See DIET; FOOD AND NUTRITION; PELLAGRA; RICKETS.

VITTADINI, FRANCO (1884-). An Italian composer, born at Pavia. Having received his first musical instruction in his native city and in Lodi, he entered the Conservatorio Giuseppe Verdi in Milan, where his teachers were Andreoli (piano), Balli (harmony), and Ferroni (composition). He became more widely known through his opera, *Amma Allegra* (Rome, 1921; New York, 1923), the text of which Illica had originally written for Puccini. *Nazareth* was brought out at Monte Carlo (1926) and *Segerto* at Milan (1929). Two other operas, *Mare di Tiberiade* and *Svenetta*, have not been produced (1929). He also wrote a considerable amount of church music.

VITTORIA, DUCA DELLA. See DIAZ, ARMANDO.

VIVIANI, vé'vya'né', RENÉ (1863-1925). A French statesman (see VOL. XXIII), who was Prime Minister at the outbreak of the World War. He resigned in October, 1915, afterward becoming Minister of Justice in Briand's cabinet and later holding the same office under Ribot. He visited the United States twice, first in 1917 as the head of the French Commission sent for the purpose of influencing the American people to help in the War, and the second time in 1921, when he was a delegate to the Disarmament Conference in Washington. In 1920 he was appointed French delegate to the first meeting of the League of Nations. He spent the last years of his life, from June, 1923, until his death in an asylum.

VLAMINCK, MAURICE DE (1876-). A French lithographer, illustrator, and painter in water colors. His works, exhibited at the Salon des Indépendants and the Salon d'Automne, are considered outstanding examples of modern abstract art. He popularized the Negro art revealed in the fetishes of African savages, which exerted a powerful influence upon the development of cubism. See PAINTING, under *France*.

VOCATIONAL EDUCATION. See EDUCATION IN THE UNITED STATES.

VOCATIONAL REHABILITATION. See AGRICULTURAL EDUCATION.

VÖGLER, ALBERT (1877-). A German industrialist, chairman of the Ruhr Steel Trust. He was born at Borbeck and after a technical education entered business life, achieving such success that he was placed at the head of the Ruhr Steel Trust, one of Germany's greatest industries. He was one of the two German delegates to the conference of reparation experts held in Paris in May, 1929, under the chairmanship of Owen D. Young. He resigned from the committee May 23, 1929, on the ground that the compromise reparations figures submitted by Mr. Young were beyond Germany's capacity to pay.

VOLK, DOUGLAS (1858-). An American painter (see VOL. XXIII). He resigned as an instructor in the National Academy of Design in 1917. He painted several important war portraits, including those of General Pershing, King Albert, and Lloyd George, in the National Gallery, Washington (1921). In 1915-16 he received the Beck Gold Medal of the Pennsylvania Academy and a gold medal from the National Arts Club, New York City. His powerful portrait of Lincoln (1923) was acquired by the Albright Art Gallery, Buffalo, N. Y.

VOLKELT, fól'kelt, JOHANNES IMMANUEL (1848-). A German philosophical writer (see VOL. XXIII). He published, after 1914, *Gewissheit und Wahrheit* (1918); *Religion und Schule* (1918); *Das Ästhetische Bewusstsein* (1920); *Gefühlsgewissheit* (1922); and *Phänomenologie und Metaphysik der Zeit* (1925).

VOLPI DI MISURATA, GIUSEPPE, COUNT (1877-). An Italian statesman and financier. After the Tripoli War between Italy and Turkey, he negotiated the peace treaty, he was Governor of Tripolitania for four years (July, 1921-July, 1925), was made a senator in 1924, and from July 9, 1925, to 1928, he was Finance Minister of Italy. His policy caused a successful period of financial reconstruction, with a return to the gold standard on Dec. 21, 1927 (see ITALY, *Finance*). He edited *La rinascita della Tripolitania* (1926); and wrote *Italy's Financial Policy* (1927) and, in collaboration with Professor Bonaldo Stringher, *The Financial Reconstruction of Italy* (1927).

VOLSTEAD, ANDREW J. (1860-). An American public official, born in Goodhue County, Minn., and educated at St. Olaf's College and Deorah Institute. In 1884 he was admitted to the bar and practiced law at Granite Falls, Minn. He was for 14 years county attorney of Yellow Medicine County. In 1903 he was elected to Congress and was successively reelected until 1922. He was the author of the Volstead Act for the enforcement of the Federal Prohibition Amendment (see PROHIBITION) and also of the Farmers' Cooperative Marketing Act. Since 1925 he has been legal adviser to the chief of the Northwestern Dry Enforcement District.

VOLUNTEERS OF AMERICA. A Christian philanthropic organization, founded in 1896 by General and Mrs. Ballington Booth. The society maintains 14 summer camps, and over 60 institutions for social work of various sorts. While cooperating with evangelical missions in many branches of relief work, the organization makes an especial effort to aid needy women under the financial care of their families. Much of this work is carried on in cities, 127 of the society's 133 philanthropic stations being in urban communities. The activities of the Volunteers of America have increased in the past few years, as indicated by the following statistics: There were 26 Sunday schools, with an enrollment of 1600, in 1923, and 80, with an enrollment of 9942, in 1928, during the same period, the number of lodgings given free, or for work or nominal fees, increased from 440,057 to 454,267; and the number of meals provided increased from 1,250,178 to 1,392,214. Employment was found for 32,244 persons in 1923, and for 45,824 in 1928. Every year, the society distributes food, clothes, and toys to the poor at Thanksgiving and Christmas time; during 1928, 80,840 families were visited, and garments given to 14,068 persons, shoes to 202,523, and holiday dinners to 137,791. The

national headquarters of the society are at 34 West 28th Street, New York City. General Ballington Booth is president.

VORONOFF, SERGE (1866-). A French surgeon who divides with Steinach and Lydston such credit as lies in the introduction of grafting the sexual glands with the aim of rejuvenating the senile and presenile invalid. He is a graduate of the University of Paris and visiting surgeon to the Russian Hospital in that city. He also is director of experimental surgery in the physiological station of the Collège de France and of the biological laboratory of the École des Hautes Études. He has published four works on gland grafting: *Vivre; Études des Moyens de Relèver l'énergie Vitale* (1920), translated into English by Mme. Voronoff; *La Glande Génitale Male*, in collaboration with Retterer (1921); *Greffes Testiculaires* (1923); *Quarante-trois Greffes du Singe à l'Homme* (1924); *Étude sur la vieillesse et le rajeunissement par la greffe* (1920); translated into English as *Study of Old Age* (1925), and as a more popular work, *The Conquest of Life* (1928). See SECRETIONS, INTERNAL.

VOROSHILOV, KLIMENTIY (1881-). A Russian Communist soldier, commander-in-chief of the Red Army. Born of a poor peasant family and a metal worker by trade, he joined the revolutionary movement when he was seventeen years old. He served in the Czarist armies during the World War and after the Bolshevik revolution was chief of staff of the Budeny cavalry in the campaigns against the counter-revolutionary forces of Denikin and Baron Wrangel. In 1921 he suppressed the Kronstadt revolt. A supporter of Stalin in the latter's struggle with Trotsky, he was appointed chief of the Red Army in 1925

upon the death of General Frunze, successor to Trotsky. He was also a member of the Communist Political Bureau and president of the Revolutionary Military Council of the United Soviet Socialist Republics.

VOESE, MARY HEATON (MRS. ROBERT MINOR) (?-). An American author born in New York City and educated in Europe. Her most successful book was *The Prestons* (1918), picturing American family life. Her other works include: *The Breaking In of a Yachtsman's Wife* (1908); *The Very Little Person* (1911); *The Autobiography of an Elderly Woman* (1911); *The Heart's Country* (1913); *I've Come to Stay* (1919); *Growing Up* (1920); *Man and Steel* (1921); *Frayer's Fist* (1923); *Passaic* (1926), *Second Cabin* (1928).

VREULS, VICTOR (1876-). A Belgian composer, born at Veiviers. He received his first education at the music school of his native town, then entered the Conservatory at Liège, and after graduation continued his studies in composition as a private pupil of d'Indy in Paris. During 1906-26 he was director of the Conservatory at Luxemburg. As a composer, he continues the tradition of César Franck. His principal works are two operas, *Olivier le Simple* (Brussels, 1922) and *Un Songe de nuit d'été* (Brussels, 1925), the symphonic poems *Werther*, *Jour de Fête* and *Cortège héroïque*; a symphony, two overtures; three preludes; two suites; two *Poèmes*, for 'cello and orchestra; two *Romances*, for violin and orchestra, *Élégie*, for flute and orchestra; *Pastorale*, for clarinet and orchestra, *Fantaisie*, for horn and orchestra, *Morceau de Concert*, for trumpet and orchestra; chamber music, piano pieces; songs (several with orchestra).

W

WABASH COLLEGE. A college for men at Crawfordsville, Ind., founded in 1832. The student enrollment increased from 329 in 1914 to 400 in 1927-28, the faculty from 16 to 29 members in 1928-29. The volumes in the library increased from 61,000 to 66,000, endowment from \$725,000 to \$1,782,749, and income to \$154,693 in 1927-28. A new curriculum, based on the plan of widest possible distribution of subjects for first and second years and concentration of interest for the third and fourth years, was put into effect in the autumn of 1928, and a chapel, costing \$150,000, was dedicated in December of the same year. President, Louis Bertram Hopkins, A M

WADSWORTH, JAMES WOLCOTT, JR (1877-) An American legislator (see Vol. XXIII). He was elected to the United States Senate from New York State in 1914 and was re-elected in 1920 for the term ending 1927. In the Senate, he was chairman of the military affairs committee and a member of the committees on foreign relations, library, and elections. He was defeated for reelection in 1926.

WAGES. Nominal wages have increased markedly in all countries since 1914, whether comparison is based on wage rates or actual earnings. So far as can be determined from available statistical data, the relative increase has been especially great in the case of wages of unskilled workers and has made their remuneration in most countries more nearly like that of skilled workers than before the World War. Among skilled workers, there has been considerable variation in the rate and amount of increase in wages, the increase was at first most noticeable in the wage of war workers, and not until later in the wages of those in the building and other trades where production was not actively stimulated until the post-war period.

In the post-war decade, the principle of high wages became one of the keystones of the American economic system. Foreign observers were amazed at the high standards of living of the American working class and reported that American working populations were earning anywhere from twice to four times as much, in buying power, as were European workers. Undoubtedly, one of the stabilizing effects in the system of installment selling was the ability of the American consuming public to absorb the extraordinary amount of luxury and semi-luxury commodities being placed on the market. The earnest efforts, following the stock-market collapse of October, 1929, of industrialists to assure a high level of wages, was one of the most salutary

expressions of faith in our modern economic order. President Hoover made the maintenance of wage levels almost his first concern in the series of industrial conferences he called following the stock break; the response he received from all industry proved the acceptance of the principle. Henry Ford was the first to take action in December, 1929, when he announced a general leveling of wages upward, the minimum wage in his American and Canadian plants being raised from \$6 to \$7 a day. Mr. Edsel Ford estimated that on the basis of the October pay roll of 144,990 employees, the increase would amount to \$19,500,000 a year. That American industrialists were preaching a new form of imperialism was apparent from the concern of such men as Edward A. Filene and Henry Ford with consuming power. Heretofore, backward peoples were exploited on the basis of what they could produce, the new canon concerned itself with their being taught to consume more. Hence, the announcement of Henry Ford, in the spring of 1929, that he planned to establish the same level of real wages for all the employees in his factories, regardless of the countries in which they worked, and when the League of Nations reported its inability to supply Mr. Ford the basic wage information he desired, Mr. Filene stepped forward with an offer of \$25,000 to finance such studies as were necessary. The figures following below show what extraordinary advances will have to be made in the case of the workmen of most of the European countries before their commodity or real dollars can be compared with American real dollars.

The International Labor Office, in order to satisfy the prevailing curiosity concerning the size of real wages in various countries, made such a comparative study for January, 1928, taking the city of Philadelphia as representative of the United States. The index numbers are for real wages. The examination was limited to a few trades, i.e., building, metal, furniture, printing, and publishing, and the price data were limited to a few articles of food. The figures are necessarily rough, but they are of value for comparative purposes.

In the summer of 1929, the International Labor Office sought to extend the scope of its inquiry to include the cost of commodities other than food and to include more than one town in each country. The result was the preparation of a series of indexes that showed the relationship of real or commodity wages a little more accurately than the figures cited for 1928. These index figures are subject, of course, to important reservations. The commodities considered, in addition to food, include soap, fuel, and light.

There have not been included the following basic necessities: clothing, housing, house furnishings. Also, the calculations include only the wages of a few categories of workers confined to large cities and for the most part disregard unskilled labor and casual labor. There follow these indexes for real wages in large towns in June-July, 1929, the base of 100 being Great Britain. The figures in parentheses indicate the number of towns in each country covered. Australia (2) 143, Austria (3) 45; Denmark (1) 104; Spain (4) 45; Estonia (2) 41; United States (10)

191; France (4) 53; Great Britain (7) 100; Irish Free State (3) 98; Netherlands (4) 95; Portugal (1) 32, Sweden (3) 101. In Germany, the post-war period has seen rises in the wages of skilled and unskilled workers, the gains of the latter being proportionately greater than those of the former. The following indexes show the hourly wages for German skilled workers for the post-war years pre-war, 100; 1924, 106; 1925, 129; 1926, 138, 1927, 146; 1928, 157; first quarter of 1929, 160. The following are the indexes for the unskilled workers in Germany, pre-war, 100; 1924, 124, 1925, 150, 1926, 161; 1927, 178; 1928, 193, first quarter 1929, 199. In Germany, since 1926, there has been also a rise in real wages. The following indexes show the increase in the purchasing power of the German worker's mark: December, 1926, 100; June, 1927, 102.3; December, 1927, 103.6; 1928, 109.3, December, 1928, 110.8. In other words, since 1926, there has been a gain of 11 per cent.

The U. S. Bureau of Labor Statistics compiled a series of index numbers of general wage rates (other than agricultural) beginning with the year 1840. It will be noticed that, with 1913 as a basis, wages mounted fairly rapidly during the war period, reaching their peak in 1920. After that year, there was a recession, but by 1926, wages had become stabilized again.

Taking into account increased wage rates in dollars and the cost of living, organized labor between 1913 and 1928 improved its position from 40 to 50 per cent. In 1927, for example, with the index for union wages at 259.9 and the index for the cost of living at 172.7, the relative purchasing power of wages measured in living costs was 150.3 or 50 per cent greater than 1913. See Table II. Table III presents the same data for the entire field of labor, both organized and unorganized.

These, however, are hourly wages. What about annual wages? What about incomes? The American Federation of Labor, in 1925, indicated

TABLE II
COMPARISON OF CHANGES IN UNION RATES OF
WAGES PER HOUR AND IN COST OF LIVING,
1907 to 1927
1913 = 100

Index Numbers of Union Rates of Wages Per Hour	Index Numbers of Cost of Living	Relative Purchasing Power of Wages as Measured in Living Costs	Changes in Purchasing Power of Wages as Compared With 1913 Per cent
1907	89.7	82.0	+ 9.4
1908	91.0	84.3	+ 7.9
1909	91.9	88.7	+ 3.6

* Food only.

that its interests were not to lie in advancing real wages; it was to concern itself with "higher social wages, for wages which increase as measured by prices and productivity." By social wages was meant an opportunity to provide for those comforts and luxuries which the middle class already possessed. To indicate that progress in this direction had been but slight, the American Federation of Labor prepared Table IV based on statistics furnished by the U. S. Census Bureau.

Reverting again to the question of the hourly wage *versus* the annual wage, it is possible to find interesting differences. In New York City,

Tobacco	1914	435	100	100
	1927	857	118	100

where the hourly wage workers in the building trades would indicate an annual income of \$3080, the actual income averaged about \$1940 per year because the workers were being employed on the average 63 per cent of the time. The following data were prepared by the National Industrial Conference Board (an employers' organization). The average annual wage in the printing and publishing business, in 9 States, runs from \$1873 in New York State down to \$1115 in Ohio; in food products, the wage runs from \$1700 in New York State to \$933 in Michigan; in the metal industries, the range of wages was from \$1615 in Ohio to \$1357 in New Jersey; in the paper and pulp industries the range of annual wages was from \$1639 in New Jersey to \$1272 in Pennsylvania; in leather products, the range was from \$1326 in New Jersey to \$963 in Pennsylvania; in textiles, the range was from \$1722 in New Jersey

to \$856 in Michigan. These figures were for the year 1928 and prevailed despite the Bureau of Labor Statistics' minimum budget of \$2000 per year for an average family of five. Against this situation was to be placed a state of affairs (figures by the Federal Trade Commission) in which 90 per cent of the wealth of the country was owned by 13 per cent of the people; in which 77 per cent of the people owned no capital at all; in which 50 per cent of the national income went to capital (unearned); in which the average wage for the country as a whole was \$1280. It was apparent to many people in the spring of 1929 that there were two sides to the shield of the much-heralded prosperity; and even so conservative an economist as Prof. Irving Fisher was authority for the statement that the great majority of the American people were living on the brink of poverty.

New light was thrown on the complicated question of the earning power of the American factory worker during the twentieth century as a result of the scholarly researches of Paul F. Brissenden, whose study *Earnings of Factory Workers, 1899 to 1927* was published as a Census Monograph late in 1929. The work rested upon the official returns of the quinquennial and biennial censuses of manufactures made by the Bureau of the Census and sought to give answer to the following questions: What have been the relative fluctuations in per-capita earnings of manufacturing wage earners during the twentieth century? What have been their per-capita amounts of earnings? What has been the degree of change that has taken place since 1899 in the variability of earnings?

The size of this wage-earning group may be gathered from the following figures: in 1899 there were 4,712,763 wage earners on the pay rolls of the factories of the country, in 1904 the number was 5,362,017; in 1914 the number was 6,896,190; in 1921 it was 6,946,570, in 1923 it was 8,778,156, in 1925 it was 8,384,261; in 1927 it was 8,351,257. Since 1899 the average number of wage-earners very nearly doubled. Mr. Brissenden's analyses concern themselves with the reported earnings of from 75 to 68 per cent of these workers for the different census years studied.

The following figures give the final results for all industries. The figures are the estimates of actual money earnings derived from the average wages as recorded in the various censuses; 1899—\$446; 1900—\$449; 1901—\$471; 1902—\$497; 1903—\$498; 1904—\$483; 1905—\$536; 1906—\$568; 1907—\$579; 1908—\$496; 1909—\$557; 1910—\$559; 1911—\$534; 1912—\$592; 1913—\$617; 1914—\$576; 1915—\$608; 1916—\$768; 1917—\$860; 1918—\$1104; 1919—\$1212; 1920—\$1488; 1921—\$1047; 1922—\$1171; 1923—\$1317; 1924—\$1310; 1925—\$1402; 1926—\$1436; 1927—\$1373. The following figures give the purchasing power of the money earnings in terms of 1914 dollars. 1899—\$603; 1900—\$591; 1901—\$604; 1902—\$621; 1903—\$593; 1904—\$582; 1905—\$646; 1906—\$660; 1907—\$636; 1908—\$570; 1909—\$640; 1910—\$608; 1911—\$562; 1912—\$617; 1913—\$623; 1914—\$576; 1915—\$620; 1916—\$718; 1917—\$667; 1918—\$703; 1919—\$677; 1920—\$726; 1921—\$595; 1922—\$705; 1923—\$830; 1924—\$776; 1925—\$825; 1926—\$830; 1927—\$805.

It is apparent from these figures that, for the 15 years preceding 1914, the American wage earner made no gains in real wages. What ad-

vances there were in single years apparently were soon canceled out by the declines of others, so that for the first half of the period under study, there was no progress. The years of the War and the post-war period tell different stories. Except for the year 1921, real wages were higher in every year than those of 1899. The gains between 1914 and 1927 were at the rate of nearly 4 per cent a year. Mr. Brissenden's conclusion at this point is: "It seems quite certain that the manufacturing wage earner has achieved permanently higher levels of real wages. History probably will record the last decade as the one to witness quite unprecedented gains in the purchasing power of the wage earners."

Individual industries show somewhat different stories. For the following 12 industries, the records were available for the whole period: automobiles; iron and steel; steam railway cars; paper and wood pulp; tobacco, cigars, and cigarettes; tanned leather; wool; cotton, silk; knit goods; men's clothing; boots and shoes. All of these with the single exception of the silk industry showed gains in purchasing power from 1922 to 1923, following the slump of 1921. Most of them reached new levels in 1923. The tobacco industry, however, is the only one in which the real wages for the whole 29 years never got higher than those in 1899. All of the 12 industries except automobiles suffered losses in real earnings from 1923 to 1924. In the woolen industry, real wages never once declined below the figure for 1899. However, this was a low-wage industry; in 1899, for example, its average wage was a good deal below that of any of the other 12 industries discussed.

The figures that follow give the purchasing power (at 1914 dollars) of manufacturing labor incomes (for males only), per capita, in the United States for all industries combined and for each of the above 12 selected industries for the years 1899, 1914, and 1927; all industries, \$603, \$576, \$805; woolen goods, \$414, \$477, \$660; cotton manufactures, \$495, \$497, \$613; silk goods, \$528, \$663, \$924; knit goods, \$528, \$532, \$723; men's clothing, \$750, \$743, \$930; boots and shoes, \$742, \$695, \$795; automobiles, \$688, \$737, \$936; iron and steel, \$770, \$673, \$1016; steam railroad cars, \$493, \$535, \$761; paper and wood pulp, \$604, \$615, \$835; tobacco, cigars, and cigarettes, \$596, \$529, \$578, tanned leather, \$577, \$532, \$645.

Finally, we present the following figures to show changes in the purchasing power of manufacturing labor incomes, per capita, by States, for the years 1899 and 1923. North Carolina, \$247, \$436; Michigan, \$577, \$991; Oklahoma, \$504, \$814; South Carolina, \$249, \$401; West Virginia, \$531, \$834; Alabama, \$409, \$591; Virginia, \$432, \$620; Ohio, \$632, \$904; District of Columbia, \$607, \$862; Kentucky, \$489, \$689; United States, \$603, \$839; Maryland, \$493, \$679; Indiana, \$622, \$844; New Jersey, \$622, \$843; Maine, \$507, \$685; Iowa, \$570, \$763; Wyoming, \$947, \$1259; Illinois, \$678, \$904; New York, \$615, \$818; North Dakota, \$670, \$882; Wisconsin, \$589, \$780; Georgia, \$316, \$414; Pennsylvania, \$627, \$824; Oregon, \$677, \$877; Connecticut, \$631, \$821; Delaware, \$550, \$711; California, \$750, \$971; Tennessee, \$427, \$539; Vermont, \$522, \$655; Rhode Island, \$543, \$678; New Hampshire, \$522, \$646; Idaho, \$818, \$1017; Arkansas, \$388, \$480; Florida, \$474, \$580; Kansas, \$636, \$767; Nebraska, \$641, \$773; Minnesota, \$647, \$782; Massachusetts, \$584, \$704;

Washington, \$793, \$960; Missouri, \$611, \$731; Texas, \$561, \$648; Mississippi, \$401, \$467; Louisiana, \$485, \$555; New Mexico, \$673, \$772; Utah, \$676, \$764; Nevada, \$1018, \$1133; South Dakota, \$704, \$753; Colorado, \$870, \$878; Montana, \$1005, \$955; Arizona, \$1007, \$902.

It is apparent that the largest increases in real earnings have occurred in States which in 1899 had levels of average earnings that were very low. Note North Carolina and South Carolina and compare their 1899 real wages with the average for the whole country. It will be seen, too, that Michigan and Ohio among the industrial States were the only ones to show increases of real earnings of more than 40 per cent over the 25-year period. During the period 1899-1914 (figures not shown here), 23 of the States showed declines in per capita earnings. By contrast, it is interesting to observe that all of the States showed gains in per capita earnings for the period 1914-1923, the increases ranging from 4 per cent in Arizona to 47 per cent in North Carolina. The following increases for the same post-war period were to be found in the leading industrial States; New Jersey, 50 per cent; Illinois, 32 per cent; New York, 43 per cent; Connecticut, 50 per cent; California, 26 per cent; Ohio, 41 per cent; Massachusetts, 33 per cent; Pennsylvania, 44 per cent.

These studies in real wages show that the American manufacturing wage earner was receiving more for his labor in the post-war period than at any time before in American history. The size of his earned income also demonstrates how pitifully small these earnings are. Even if an additional 10 per cent should be added to his wage to include the earnings of members of his family and income from rent, still the total would be a long way from the hypothetical \$2000 needed by the average American family to provide the ordinary comforts of life. One of the ironies of the situation is to be found in the fact that this \$2000 standard budget is employed by welfare societies in their ministrations of dependent families, economically independent families, not dependent upon charity, are expected to live on much less. The industrialists, who support the family welfare societies and therefore give tacit consent at least to the use of the standard budgets for dependents, are the very ones who expect their workers to subsist on smaller budgets. Other economists, whose work has helped to clarify the real wage situation, are I. M. Rubinow, Paul H. Douglas, Willford I. King, and Leo Wolman. The reader is referred to *Middletown* (by the Lynds), that remarkable sociological record of the life of a typical post-war American community, where actual inquiries have elicited a wage situation not unlike the facts presented above.

WAGNER, ROBERT FERDINAND (1877-). A United States Senator. He was born at Nastatten, Province of Hessen, Germany, and removed to the United States in childhood. He was graduated from the College of the City of New York (1898), received the degree of LL.B. from the New York Law School in 1900, and began the practice of law in New York City. A member of the New York Assembly in 1906-08 and of the State Senate in 1909-18, with an interval as lieutenant governor in 1914, he became a Justice of the Supreme Court of New York in 1919. He resigned from the bench to take the United States Senate seat to which he was elected as a Demo-

crat in 1926 for the term ending in 1933. He was a member of the Senate committees on banking and currency, foreign relations, interstate commerce, and public lands.

WAGNER, *vågner*, SIEGFRIED (1869-). A distinguished German composer and conductor (see VOL. XXIII). In 1923 he made a tour of Europe to collect funds for the renovation of the Bayreuth theatre, and for the same purpose he visited the United States in 1924, when he was heard at his American début as guest-conductor of the Detroit Symphony Orchestra (Jan. 31) and later in New York, Cleveland, and Baltimore. These tours were so successful, that the famous festivals were resumed in the summer of 1924, after an interruption of 10 years. In the meantime, advanced age and the precarious state of her health had compelled Cosima Wagner, the master's widow, to relinquish the general direction of the festival, which then passed into the hands of the son. His list of compositions is completed by an orchestral scherzo, *Und wenn die Welt voll Teufel war*; and the operas, *An allem ist Hütchen schuld* (Stuttgart, 1917), *Schwarzwaldenreich* (Karlsruhe, 1918), *Sonnenflammen* (Darmstadt, 1918), *Der Schmied von Marienburg* (Rostock, 1923), *Der Friedensengel* (Karlsruhe, 1926). The following operas are completed, but have not yet been performed: *Der Haisdekong*; *Ramulf und Adalasia*, *Die heilige Linde*, and *Wahnopfer*. In 1922 he published his memoirs under the title *Erinnerungen*. Consult *Wahnfried*, by R. du Moulin-Eckart (Leipzig, 1925) and *Siegfried Wagner*, by O. Daube (Munich, 1925).

WAGNER VON JAUREGG, JULIUS (1857-). An Austrian psychiatrist whose malarial inoculation treatment of paresis, introduced in 1917, has been the means of curing about 30 per cent of all patients treated. The disease was previously rapidly fatal. For this triumph, he was awarded the Nobel Prize in medicine for 1926-27. He received the degree of M.D. from the University of Vienna in 1881 and after teaching psychiatry there was made full professor of psychiatry and neurology in 1902. For many years, he was director of the insane asylum at Troppau. His valuable work has been published by his assistants. He also acquired some renown for his campaign against endemic goitre in Styria, obtaining good results from thyroid medication.

WAGSTAFF, BLANCHE SHOEMAKER (1888-). An American author, born in New York City, and educated at the Brearley School and Miss Spence's School in New York. During the World War, she acted as chairman of the National Women's Service League. Her writings include *Songs of Youth*, poems (1906); *Woven of Dreams*, poems (1907); *Atys* (1909), *Alcestris*, a Greek drama staged at the Hudson Theatre in New York City (1911); *Eris*, a drama (1913); *Narcissus* (1917); *Book of Love* (1917); *Quiet Waters* (1921); *A Stranger's Sojourn* (1926); *Bob the Spaniel* (1927).

WAHABITES. See ARABIA; PAN-ISLAMISM.

WAHL, *val*, ADALBERT EMIL AUGUST (1871-). A German historian (see VOL. XXIII). He published *Beiträge zur Geschichte der Konfliktzeit* (1914); *Von Bismarck der Siebziger Jahre* (1920), *Zwischen den Kriegen* (1923); *Der volkische Gedanke* (1924); and *Deutsche Geschichte von der Reichsgründung bis zum Weltkrieg* (1926).

WAILING WALL. See PALESTINE, under *History*.

WALDSTEIN, SIR CHARLES. See WALSTON (Waldstein), SIR CHARLES.

WALES. See GREAT BRITAIN.

WALES, ARCHBISHOP OF. See EDWARDS, MOST REV ALFRED GEORGE.

WALES, PRINCE OF. See EDWARD (ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID).

WALKER, STUART (?-). An American playwright, born at Augusta, Ky., and educated at the University of Cincinnati. He was play reader, actor, and stage manager for David Belasco (1909-14) and in 1914 became stage director for Jessie Bonstelle. He became an independent producer in 1915 and directed the Repertory Company in Indianapolis from 1917 to 1923 and the Repertory Theatre in Cincinnati, 1922-23. He was the originator of the Portmanteau Theatre and wrote *Portmanteau Plays* (*The Triplet*, *Nevertheless*, *The Medicine Show*, *She Who Pass While the Lentils Boil*, 1917), and *More Portmanteau Plays* (*The Lady of the Weeping Willow Tree*, *The Very Naked Boy*, *Jonathan Makes a Wish*, 1919); *Five Flights Up* (1922); *The King's Great Aunt Sits on the Floor* (1923).

WALKER, WILLIAM HULTZ (1869-1923). An American chemist (see VOL. XXIII). He was lieutenant colonel in the National Army during the World War, chief of the Chemical Service Section, and later a colonel in the U. S. Army in charge of the Gas Offense Division. In 1919 he was awarded the Distinguished Service Medal.

WALLACE, HENRY CANTWELL (1866-1924). An American public official, born at Rock Island, Ill., and educated at the Iowa State College of Agriculture. He engaged in farming in Iowa from 1887 to 1891, taught for a while in the Iowa State College of Agriculture, and was associated editorially with *The Creamery Gazette*, *Farm and Dairy* (1893-95), and *Wallace's Farmer* (1895-1924). In 1921 President Harding appointed him Secretary of Agriculture. His work in the department was considered highly satisfactory.

WALLACHIA. See RUMANIA.

WALLIN, (J(OHN) E(DWARD) WALLACE (1870-). An American psychologist, born in Page County, Iowa, and educated at Yale University. He began teaching psychology at Clark University in 1901, went to the University of Michigan in 1902, and from 1903 to 1906 was demonstrator in experimental psychology at Princeton University. He had professorships in several normal schools and in 1921 he was made director of the bureau of special education at Miami University. His writings include: *Researches on the Rhythm of Speech* (1902); *Optical Illusions of Reversible Perspective* (1905); *Experimental Studies of Mental Defectives* (1912); *The Mental Health of the School Child* (1914); *Measurement of Mental Traits in Normal and Epileptic School Children* (1923); *The Education of Handicapped Children* (1924); *Studies of Mental Defects and Handicaps* (1925); *Clinical and Abnormal Psychology* (1927).

WALPOLE, HUGH (SEYMOUR) (1884-). An English novelist (see VOL. XXIII). He served with the Russian Red Cross during 1914-16, and became a commander of the Order of the British Empire (1918), and holder of the Georgian Medal. His later publications include: *The Golden Scarecrow* (1915); *The Dark Forest* (1916); *Joseph Conrad* (1916); *The Green Mir-*

ror (1918); *The Secret City*, which won the Tait Black Prize (1919); *Jeremy* (1919); *The Captives* (1920); *The Thirteen Travellers* (1921); *The Young Enchanted* (1922); *The Cathedral* (1922); *Jeremy and Hamlet* (1923); *The Old Ladies* (1924); *Portrait of a Man With Red Hair* (1925); *The English Novel* (Rede Lecture, 1926); *Harmer John* (1926); *These Diversions: Reading* (1926); *Jeremy at Crale* (1927); *Wintersmoon* (1928); *The Silver Thorn*, short stories (1928); *Book of Stories* (1928); *Anthony Trollope (English Men of Letters, New Series, 1928)*; and *Hans Frost* (1929). Consult *Tradition and Hugh Walpole*, by Clemence Dane (1929).

WALSH, DAVID IGNATIUS (1872-). A United States Senator, who was born at Leominster, Mass., and graduated at Holy Cross College, Worcester, Mass. (1893), receiving the degree of LL.B. from the Boston University Law School in 1897. He was twice elected as a Democrat to the Massachusetts House, where he was the author of laws regulating the State's employment of labor. In 1913 he became lieutenant governor and in 1914 governor, serving two years. He was delegate-at-large to the Democratic National Conventions from 1912 to 1928, inclusive, and was delegate-at-large to the Massachusetts Constitutional Convention of 1917-18. He was elected to the United States Senate in 1918 for the term ending in 1925, but was defeated for reelection. He was again elected, to fill an unexpired term, in 1926, and in 1928 was reelected for the term ending in 1935. He is a member of the Senate committees on education and labor, finance, naval affairs, printing, and public buildings and grounds.

WALSH, JAMES JOSEPH (1865-). An American physician and author (see VOL. XXIII). Dr. Walsh has written a number of books since the World War on his favorite subjects of medical history and biography, psychotherapy, and the accomplishments of the Roman Catholic scientists. These comprise *Health through Will Power* (1919); *History of Medicine in New York* (1919); *Medieval Medicine* (1920); *Religion and Health* (1920); *Cures: the Story of Cures that Fail* (1923); *Eating and Health* (1925); *Spiritualism a Fake* (1925); *Laughter and Health* (1927).

WALSH, THOMAS JAMES (1859-). A United States Senator (see VOL. XXIII). He was reelected from Montana for the terms 1919-31 and was chairman of the Democratic National Convention in 1924. As chairman of a subcommittee of the Senate committee on public lands, Senator Walsh conducted a searching investigation of government oil-land leases in 1924. He also had been active as a member of the foreign relations committee.

WALSH, THOMAS JOSEPH (1873-). An American Roman Catholic bishop, born at Parker's Landing, Butler Co., Pa. He studied at the College and Seminary of St. Bonaventure and in Rome, and was ordained to the Roman Catholic priesthood in 1900. He served as assistant director at St. Joseph's Cathedral in Buffalo until 1900, and from that year until 1915 he was private secretary to Bishops Quigley and Colton. He also acted as chancellor of the diocese. From 1915 to 1918, he was director of St. Joseph's old Cathedral in Buffalo. He was consecrated Bishop of the Diocese of Trenton, N. J., in 1918 and transferred from Trenton to the Newark Diocese in 1928.

WALSTON (WALDSTEIN), SIR CHARLES (1856-1927). A British archaeologist. He was born in New York City and studied at Columbia and Heidelberg. At Cambridge University, he was director of the Fitzwilliam Museum (1883-89) and reader in classical archaeology (1883-1907). From 1895 to 1901, and again from 1904 to 1911, he was Slade professor of fine arts in King's College, Cambridge. He acted as director of the American Archaeological School at Athens from 1889 to 1893 and conducted several important excavations, including the site of ancient Plataea (1889-93), Eretria (the tomb of Aristotle), in 1891, and the Heraion of Argos (1892-95). His publications include, *The Study of Art in Universities* (1895); *Expansion of Western Ideals and the World's Peace* (1899); *The Jewish Question* (1899); *Herculeum* (1908); *Greek Sculpture and Modern Art* (1914); *Aristodemocracy* (1916); *What Germany is Fighting For* (1917); *Patriotism, National and International* (1917); *The Next War* (1918); *The English-Speaking Brotherhood and the League of Nations* (1919); *Alcmena and the Establishment of the Classical Type in Greek Art* (1926).

WALTER, BRUNO (1876-). A German conductor, born in Berlin. He was trained at Stern's Conservatory, where his teachers were Ehrlich, Bussler, and Radecke. After short periods as conductor in Cologne, Hamburg, Breslau, Presburg, Riga, and Berlin, he rose rapidly to a position of preeminence through his brilliant work at the Hofoper in Vienna (1901-13). In 1914-22 he was Hofkapellmeister and Generalmusikdirektor in Munich, succeeding Felix Motil. He made extensive tours as a guest-conductor and in 1923 visited the United States, where his appearances with the New York Symphony Society and the Boston, Minneapolis, and Detroit Symphony orchestras made a profound impression. During 1925-29 he was general musical director of the Deutsches Opernhaus in Charlottenburg (Berlin). Since 1924 he has been the regular conductor of the German operas at Covent Garden. His compositions include two symphonies, *Das Siegesfest*, for soli, chorus, and orchestra; a piano quintet; a piano trio; a string quartet; and a violin sonata.

WANAMAKER, (LEWIS) RODMAN (1863-1928). An American merchant, son of John Wanamaker, born in Philadelphia. He was graduated from Princeton in 1886, and became associated in business with his father as vice president of the John Wanamaker stores in New York and Philadelphia. He was resident manager in Paris for 10 years. For several years, he was consul general at Philadelphia for Paraguay and other South American countries. He financed three expeditions to the West to study Indian life and presented their collections to the Government at Washington. He also gave an art collection to Princeton University. During the World War, he served as chairman of the mayor's committee in New York to welcome homecoming troops. Following the death of his father in 1922, he became head of the Wanamaker business. Mr. Wanamaker was a leader in numerous civic and philanthropic movements. He presented to New York the perpetually burning light and altar of liberty, in Madison Square, as a memorial to the American dead in the World War. In his later years, he devoted much time and money to the advancement of aviation. He received decorations from Great Britain, France, Italy, Belgium, Serbia, and Venezuela.

WAR BANKING AND FINANCE. See FINANCE AND BANKING, *War Banking and Finance*.

WAR CASUALTIES. See WORLD WAR CASUALTIES

WARD, HENRY BALDWIN (1865-). An American zoologist, born at Troy, N. Y., and educated at Williams College and Harvard University and at Gottingen, Freiburg, and Leipzig. After teaching science in Troy (1885-88), he was instructor in zoology at the University of Michigan (1893); associate professor and professor of zoology (1892-1909) at the University of Nebraska and dean of the college of medicine there (1902-09); and professor (since 1909) at the University of Illinois. His research work was in connection with the Michigan Fish Commission, the biological survey of the Great Lakes, the Alaska salmon investigations, and studies on parasites of man and the lower animals. He published *Fresh Water Biology*, with Whipple (1917), and founded and was editor of the *Journal of Parasitology*.

WARD, JAMES (1843-1925). A British philosopher and psychologist (see Vol. XXIII). His *Psychological Principles* was published in 1918. It contains a systematic exposition of mental life from the point of view of the Act school. The mind is defined as a "continuum of presentations." In 1920 an honorary LL.D. from Cambridge was added to his long list of degrees. In 1922 Professor Ward published his exhaustive *Study of Kant*.

WARD, RT HON SIR JOSEPH (GEORGE), FIRST BARONET (1856-). A Premier of New Zealand, born at Melbourne, and educated privately. At 30 he was elected to Parliament as a Liberal, and in 1891 became Postmaster General, an office which he held continuously until 1912. He held many cabinet posts and was Premier of New Zealand from 1906 to 1912. He was made a baronet in 1911. At the outbreak of the World War, he was leader of the Liberal Party, and in 1915 entered the National Ministry, a coalition of the Liberal and Reform parties brought about by the War, as Finance Minister and Postmaster General. Sir Joseph represented New Zealand with Premier Massey at the War Conferences in London (1916-18), and at the Peace Conference in Paris (1919). On his return, he resigned from the cabinet and was defeated in the election which followed. Massey's Reform Party remaining in power. He was re-elected to Parliament in 1925, and as leader of the United Party again became Premier, and Minister of Finance and of External Affairs on Dec 10, 1928.

WARD, ROBERT DE COURCY (1867-). An American climatologist. He was born in Boston and graduated from Harvard, where he has taught since 1890, holding a professorship in climatology since 1910. In 1927 he served as Harvard exchange professor with Western colleges. He was editor of the *Meteorological Journal* from 1892 to 1896. In 1908 he was a member of the Shaler Memorial Expedition to Brazil. He has been president of the Association of American Geographers and of the American Meteorological Society. In 1894 he was one of the founders of the Immigration Restriction League. He is the author of *Practical Exercises in Elementary Meteorology* (1899), *Climate Considered Especially in Relation to Man* (1908, 1918); and *The Climates of the United States* (1925).

WAR FINANCE CORPORATION. See AGRICULTURAL CREDIT.

WAR IN EUROPE. See WORLD WAR.

WARNE, FRANK JULIAN (1874-). An American economist, born in Parkersburg, W. Va., and educated at the University of Pennsylvania (Ph.D., 1902). From 1896 to 1902, he was connected with the Philadelphia *Public Ledger*, and during 1903-06 he was editor of *The Railway World*. In 1908 he became secretary of the New York State Immigration Commission, and in 1910 was special expert with the U. S. Census Bureau. He was associated with several railroad labor organizations, and during the World War was chief statistician of the Emergency Fleet Corporation. In addition to many pamphlets and special articles, he is the author of *The Slav Invasion and the Mine Workers* (1904); *The Coal Mine Workers* (1905); *The Immigrant Invasion* (1913); *Railway Operation and Finance* (1914); *Intercompany Ownership and Interlocking Directorates of the Railroads of the United States* (1914); *The Tide of Immigration* (1916); *Warne's Book of Charts* (1917); *Industrial Relations* (1919); *The Workers at War* (1920); and *Tram Employees' Reply to the Railroads* (1921).

WARNER, EDWARD PEARSON (1894-). An American aeronautical engineer, born in Pittsburgh, Pa., and educated at Harvard University and the Massachusetts Institute of Technology. He was engaged in aeronautical work continuously after 1916. He taught at the special army and navy schools in aeronautical engineering, was aero engineer with the U. S. Army, and did wind-tunnel work and made miscellaneous researches in stability and stress analysis (1917-18). In 1918-20 he was chief physicist with the National Advisory Committee for Aeronautics. He was in charge of aeronautical research at Langley Field and after 1919 was secretary of the committee on aerodynamics of the National Advisory Committee for Aeronautics. In 1920 he became associate professor of aeronautics, and in 1924, professor, at the Massachusetts Institute of Technology. He was Assistant Secretary of the Navy for Aeronautics from 1926 to 1929, when he became editor of *Aviation*. He has written many books, reports, and technical notes, dealing chiefly with stability, stress analysis, and free-flight testing. Among his recent publications are *Aerostatics* (1926) and *Airplane Design—Acrodynamics* (1927).

WARREN, CHARLES (1868-). An American lawyer, born at Boston, Mass., and educated at Harvard University and its law school. Admitted to the bar, he practiced in Boston, and after acting as private secretary to Gov William E. Russell, he was associated with him in law practice until the latter's death in 1896. From 1914 to 1918, he was Assistant Attorney General of the United States. He wrote *The Girl and the Governor; History of the Harvard Law School and Early Legal Conditions of America* (1909); *The Supreme Court in United States History* (3 vols., 1922), awarded the Pulitzer Prize for the best book on American history published in 1922, *The Supreme Court and Sovereign States* (1924); *Congress, the Constitution and the Supreme Court* (1925); and *The Making of the Constitution* (2 vols., 1928).

WARREN, CHARLES REECHER (1870-). An American lawyer and diplomat, born at Bay City, Mich., and educated at the University of Michigan. He began the practice of law in Detroit in 1893. He was associate counsel for the United States before the Joint High Commission

on the Behring Sea claims in 1896, and also represented the United States in the North Atlantic coast fisheries arbitration with Great Britain before The Hague tribunal in 1910. During the World War, he served on the staff of the Judge Advocate General. In 1921 he became United States Ambassador to Japan, and the negotiations which he carried on with the Japanese government resulted, in March, 1923, in the cancellation of the Ishii-Lansing Agreement. He resigned from this post in December, 1923, and was appointed United States Ambassador to Mexico in January, 1924, but he resigned in the following August. He was chairman of the committee on platform and resolutions at the Republican National Convention in 1924. In 1925 he was named by President Coolidge for the office of Attorney General, but his nomination was twice rejected by the Senate.

WARREN, FRANCIS EMROY (1844-1929). An American legislator (see VOL. XXIII). He served as United States Senator from Wyoming from 1890 to 1893 and continuously from 1894. He was reelected in 1924 for the term ending in 1931. He was chairman of the committee on appropriations in the Seventieth Congress and was also a member of the committees on military affairs and public buildings and grounds. He was the oldest Senator in point of service.

WARREN, LLOYD (ELIOT) (1868-1922). American architect. He was born in Paris in 1868 and was educated in the United States at Columbia University, graduating from its College (1888) and from its School of Architecture (1891), he returned to Paris to become a student in the École des Beaux Arts, and remained in that city for seven years. In 1899 he again came to the United States, where he was for a time with his brother Whitney Warren in the architectural firm, Warren & Wetmore. Later, he became identified with the Society of Beaux Arts Architects, which from little more than a social architectural organization soon grew to be an educational system, with schools in many cities of the United States and Canada, and with its associated Institute of Design offering criticism to architectural students of more than 20 universities. During the World War, Mr. Warren was director of education and dean of the faculty in the Education Corps of the American Expeditionary Force, at Belleville, France. He was also a member of the *Fraternité des Artistes*, which came to the assistance of the families of French painters and architects. The French government awarded him the Legion of Honor.

WARREN, WHITNEY (1857-). An American architect (see VOL. XXIII). Following the bombardment of Reims Cathedral by the Germans during the World War, he made an examination of the damage done and prepared a report on restoration. He also prepared plans for and supervised the reconstruction of the University of Louvain in Belgium, destroyed by the Germans in 1914. The Library, designed by him and built by American contributors, was dedicated on July 4, 1928. He protested against the change in the inscription attributing the destruction of the building to "Teutonic fury," but was overruled and it was duly modified before being carved on the building. He then brought suit to enforce the use of the original inscription, which he said had been furnished by Cardinal Mercier, in October, 1929, and a Belgian court decided in his favor. See LOUVAIN LIBRARY. He is a member of many architectural

societies in the United States and foreign countries. He wrote *Montenegro: the Crime of the Peace Conference* (1922). Several of his lectures during the War period were published.

WARREN, WILLIAM FAIRFIELD (1833-1929). An American theologian and educator, born in Williamsburg, Mass. (See VOL. XXIII.) He was graduated from Wesleyan University (1853), studying later at the Andover Theological Seminary (1854-56) and at the universities of Berlin and Halle (1856-58). In 1855 he was ordained in the Methodist Episcopal ministry. From 1860 to 1866, he was professor of systematic theology in the Mission Institute of Bremen, Germany (becoming later the Martin Institute of Frankfurt). On his return to the United States, he was acting president of the Boston Theological Seminary (1866-73), which was the nucleus for Boston University. Dr. Warren was one of the organizers of that university and served as its president from 1873 to 1903. In 1873 he became also professor of comparative theology and philosophy of religion at the theological school of Boston University, and he was its dean in 1903-11. In 1923 he was made president emeritus of Boston University.

WAR-RISK INSURANCE. See INSURANCE.

WARSHIP. See VESSEL, NAVAL; NAVIES OF THE WORLD.

WAR TAXES. See TAXATION IN THE UNITED STATES.

WASHBURN, ALBERT HENRY (1866-). An American diplomat, born at Middleborough, Mass., and educated at Cornell University and at the law school of the University of Virginia. From 1890 to 1893, he was United States Consul at Magdeburg, Germany, and later held various public offices. He became professor of international law at Dartmouth in 1919. In 1922 he was appointed Minister to Austria. He was president of the mixed commission to adjust differences arising out of provisional trade agreements between Austria and Yugoslavia, 1923-24.

WASHBURN, EDWARD WIGHT (1881-). An American chemist, born at Beatrice, Nebr., and educated at the Massachusetts Institute of Technology. In 1908 he became an associate at the University of Illinois, where during 1913-16 he was professor of physical chemistry and from 1916 to 1922, professor of ceramic chemistry and head of the department of ceramic engineering. Since 1926 he has been chief chemist of the U. S. Bureau of Standards. Dr. Washburn has made studies in physical chemistry on ionic hydration, the theory of solutions, high-temperature chemistry, and the physics of ceramic materials. In addition to many papers on chemical, physical, and ceramic matters, he is the author of *Introduction to the Principles of Physical Chemistry* (1915; 2d ed., 1921).

WASHBURN COLLEGE. A coeducational institution founded at Topeka, Kansas, in 1865. The student enrollment increased from 831 in 1915 to 1235 in 1927-28, exclusive of the summer-session registration which amounted to 259. The endowment rose from \$950,893 to \$1,295,710, and the value of the buildings from \$274,708 to \$709,624. There were 67 members on the faculty in 1928. The library increased from 35,000 volumes in 1923 to 37,051 in 1928. Benton Hall, a dormitory for women, Mulvane Art Museum, and the Larrick Memorial Fountain were constructed prior to 1928; Holbrook Hall, formerly a dormitory for women, was remodeled and con-

THE LINCOLN MEMORIAL AT WASHINGTON, D. C.

verted into a classroom building from the school of law; and in 1928 an athletic field, seating 7500, and a field house, costing \$185,000, were constructed. President, Parley P. Womer, Sc.D.

WASHINGTON. The capital of the United States. Since the close of the World War, Washington has increased in population, which in 1920 was 437,571, and an official estimate in July, 1928, showed 552,000. With this growth of population has come increased business, making necessary the widening of thoroughfares, such as Connecticut Avenue and Thirteenth and Fifteenth streets, and the extension of business zones. This prosperity has been marked by a larger and better class of business houses, notably on F Street and on Connecticut Avenue. For the housing of this growing population, many large apartment houses have been built, such as the Cathedral Mansions, La Salle Apartments, Meridian Mansions, and Tilden Gardens; also new hotels, such as the Carlton, Hays-Adams, Mayflower, and Wardman Park, all of attractive design, have been completed. Between 1914 and 1920, many public buildings and monuments were constructed. During the War, concrete office buildings were erected for the Navy and War departments, a stone office building for the Department of the Interior, and 12 temporary hotels of gray stucco for women war workers, who found it extremely difficult to find quarters. The latter were removed in 1929 to make possible the elaborate improvements planned for the approaches to the Capitol, especially between it and Union Station.

The Lincoln Memorial, finished in 1921 at a cost of \$2,584,000, is a finely proportioned building in the form of a Greek Temple, containing a colossal seated figure of Lincoln, in marble, by Daniel Chester French, and mural paintings representing emancipation and reunion. The Grant Memorial, the work of Henry Merwin Shrady, was dedicated in 1922, and adjacent to this is the recent sculpture by Charles Gaffey of Gen. George G. Meade and his associates, who gained the victory at Gettysburg. The National Academy of Sciences, on a gift of \$5,000,000 from the Carnegie Corporation in 1919, erected a new building to contain its library and exhibition rooms. The Freer Gallery of Art was erected under the direction of the Smithsonian Institution, through a gift from Charles L. Freer, to house the American and Oriental art collections of the capital; and more recently, the home of the Chamber of Commerce of the United States of America has been completed. The National Shrine of the Immaculate Conception was begun by the Roman Catholic Church; and work on the National Cathedral was continued by the Protestant Episcopal Church which in 1929 was completed, except the transepts; and the Bishop's Garden and an approach to the cathedral are nearly finished. A National church edifice has been proposed for the Presbyterian denomination in Washington, and land has been purchased for that purpose.

On upper Sixteenth Street is Meridian Park, which is slowly approaching completion and is already adorned with statues of Joan of Arc, Dante, and President James Buchanan. On this thoroughfare are several new and beautiful churches, notably the First Baptist, All Souls (Unitarian), and St. Stephen's (Protestant Episcopal). Here also are the recently erected embassy buildings of Cuba and Italy, while the stately British Embassy on upper Massachusetts Avenue was completed in 1929.

The most important of all the great improvements in Washington culminated in 1929, when public announcement confirmed the adhesion of Congress to the L'Enfant plan by the purchase of the greater portion of the triangle between the White House on the west, Pennsylvania Avenue on the north, the Smithsonian grounds on the south, and the Capitol grounds on the east. Definite plans were made for the erection of a series of public buildings which were published, and work was begun on an office building for the Department of Commerce (to be the largest building of its kind in the United States) and the Internal Revenue Building on B and Tenth streets to face the National Museum, together with the erection of the central portion of the building for the Department of Agriculture. This occupation of the triangle by government buildings has compelled the removal of the present Centre Market to the northeast section of the city in the vicinity of Fifth Street and Florida Avenue, formerly occupied as Camp Meigs. The Memorial Bridge, crossing the Potomac near the Lincoln Memorial, will connect Washington with Arlington, where the National Cemetery and Lee's old home are located and at the Virginia end of which will start the Memorial Highway to Mount Vernon, authorized by Congress. These two memorials are to be completed for the bicentennial celebration of the birth of George Washington in 1932. Methods of transportation have been improved, notably the addition of bus lines, some urban and some suburban. Also a traffic system operating colored lights has been installed on the leading thoroughfares.

In 1927, 9519 persons were employed in 503 industrial establishments and received \$15,668,655 in wages, the value of products manufactured was \$90,389,537. Bank clearings in 1928 amounted to \$1,435,725,000. The assessed valuation of property in 1927 was \$1,523,588,000.

WASHINGTON. The nineteenth State in size (69,127 square miles), and the thirtieth in population, capital, Olympia. The population increased from 1,140,990 in 1910 to 1,356,621 in 1920, or by 18.8 per cent; estimated population, 1928, 1,587,000. The white population increased from 1,109,111 (1910) to 1,319,777 (1920). The number of Indians fell from 10,997 to 9061, that of Chinese from 2709 to 2363. Japanese increased in number from 12,929 to 17,387, and Negroes, from 6058 to 6883. The native white population rose from 867,914 to 1,069,722; the foreign-born white, from 241,197 to 250,055. Both urban and rural populations mounted, the former from 605,530 to 748,735, the latter from 536,460 to 607,886. The growth of the principal cities was as follows: Seattle, 1910, 237,194, 1920, 315,312; Spokane, 104,402, 104,437; Tacoma, 83,743, 96,965. See articles on these cities.

Agriculture. A considerable increase in agriculture occurred in Washington from 1910 to 1920, which was fairly maintained in the difficult years thereafter. The increase in the number of farms, 18 per cent from 1910 to 1920, was continued; farms numbered 66,288 in 1920; 73,267 in 1925. The acreage of land in farms increased from 11,712,235 in 1910 to 13,244,720 in 1920, and was 12,610,310 in 1925. The improved land in farms totaled 7,129,343 acres in 1920. The percentage of the total land area used for agricultural purposes was 27.4 in 1910, and 29.5 in 1925. The total value of farm property rose from \$637,543,411 in 1910 to \$1,057,429,848 in 1920, or 65.9 per cent, and declined thereafter to

\$823,437,940 in 1925; the average value per farm was \$11,346 in 1910, \$15,952 in 1920, and \$11,239 in 1925.* In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 60,389 were operated by owners, 935, by managers; and 11,943, by tenants. The corresponding figures for 1910 were 47,505, 961; and 7726. White farmers numbered 65,022 in 1920, of whom 45,265 were native and 13,757, foreign born. There were 1266 colored, 460 Indian and 699 Japanese, farmers. White farmers numbered 55,067 in 1910 (37,770 native and 17,297, foreign-born) and in that year there were 673 Indian, and 316 Japanese, farmers. Farms reported as under mortgage numbered 24,004 in 1920; 27,604 in 1925. The area under irrigation increased from 334,378 acres in 1909 to 529,899 in 1919. The number of dairy cows was 289,635 in 1920; 266,216 in 1925; "beef" cows numbered 88,969 in 1920; 71,577 in 1925; sheep, 623,779 in 1920, 515,789 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 1,794,000 bushels; wheat, 48,644,000; oats, 9,447,000; barley, 1,952,000, potatoes, 9,045,000; hay, 2,186,000 tons. Comparative figures for 1913 are corn, 952,000 bushels, wheat, 53,300,000; oats, 14,250,000, barley, 7,290,000; potatoes, 7,380,000; and hay, 1,794,000 tons.

Mining. The mineral resources of Washington are as yet largely undeveloped. The chief mineral is coal, although cement, clay, sand, and gravel also are produced in valuable quantities. The coal output during the period starting with 1914 was as follows: 1914, 3,064,820 net tons, 1916, 3,038,588, 1917, 4,009,902; 1918, 4,082,212, 1920, 3,575,093; 1921, 2,428,722, 1922, 2,581,165, 1926, 2,586,568. The value of the cement produced annually was between \$2,000,000 and \$6,000,000 during this period. The State also produced small amounts of copper, gold, and non ore. The total value of the mineral production in 1926 was \$21,256,952, compared with \$26,677,191 in 1920; \$18,267,938 in 1919, \$20,999,691 in 1918; and \$13,830,739 in 1914.

Manufactures. Washington developed greatly in industrial importance during the World War. There were 10 cities having more than 10,000 inhabitants in the State in 1920. There were 3674 manufacturing establishments in the State in 1909; 4918 in 1919, 3216 in 1925; and 3344 in 1927. Wage earners in manufacturing numbered 132,928 in 1919; 105,893 in 1925, and 104,468 in 1927; capital invested amounted to \$222,261,229 in 1909 and \$574,235,183 in 1919. The value of the manufactured product amounted to \$220,746,421 in 1909, \$809,622,984 in 1919; \$659,339,836 in 1925; and \$677,913,579 in 1927. The increase in the value of products evidenced in 1919 was due in great measure to changes in industrial conditions brought about by the World War and cannot be properly used as an index of the industrial expansion during the war period. The lumber and timber industry of the State is chief in point of value of product, with an output valued at \$89,155,000 in 1909; \$234,881,000 in 1919; and \$273,545,537 in 1925. Shipbuilding and boatbuilding attained importance during the War, amounting to \$1,550,000 in 1909 and \$166,520,000 in 1919. The chief manufacturing cities are Seattle and Tacoma. In 1909 there were in Seattle, 753 manufacturing establishments with a product valued at \$50,814,000; in 1919, 1229 with \$274,431,000, in 1925, 1005 with

products valued at \$159,566,000; in 1927, 1154 with \$168,032,381. In 1909 Tacoma had 277 establishments, with products valued at \$24,462,000; in 1914, 399 with \$27,708,000; in 1919, 248 with \$103,172,000; in 1925, 289 with \$71,001,327, in 1927, 322 with \$79,381,871.

Finance. State expenditures in the year ended Sept. 30, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$22,921,765 (of which \$9,683,539 was aid to local education); for interest on debt, \$716,615; for permanent improvements, \$11,116,449; total, \$34,754,829 (of which \$9,556,931 was for highways, \$2,585,305 being for maintenance and \$6,971,626 for construction). Revenue was \$35,622,467. Of this, property and special taxes formed 48.3 per cent; departmental earnings and charges for officials' services, 6.6 per cent, sales of licenses and taxation of gasoline, 34.5 per cent. Property valuation was \$1,216,089,557, State taxation thereon, \$13,792,277. Net State funded debt on Sept. 30, 1927, was \$12,911,977.

Education. Educational progress in Washington has been steady. The Legislature in the course of successive sessions has passed important school measures. Progress was especially notable in connection with the rural-school work. The following objects have been accomplished. The establishment of a State-wide retirement fund, a constructive programme in State-wide consolidation; increased aid for high schools; increased direct supervision of rural schools through the eighth grade, exemption laws and higher professional standards for teachers. Strong efforts were being made for the grouping of related school districts in neighboring units sufficiently large to support community high schools. Vocational education has been carried on since 1919, and the Legislature passed an act providing for its further development in accordance with the Smith-Hughes Act. The enrollment in public schools increased from 239,663 in 1914 to 329,288 in 1925-26. To the latter total, the high-school enrollment furnished 70,474, the kindergarten and elementary grades, 258,811. Total expenditure for public day schools in 1925-26 was current, \$26,075,815; outlays, \$4,652,165. The percentage of illiteracy in the State decreased from 3.2 in 1910 to 2.1 in 1920. In the native white population, it remained at 0.3 per cent, in the foreign-born white, it increased from 4.7 to 5 per cent, in the Negro, it decreased from 4.8 to 4.6.

Political and Other Events. Senator Wesley L. Jones was reelected in 1914 (also in 1920 and 1926). In Seattle, Hiram C. Gill, who was once recalled as mayor, was again chosen mayor on a Nonpartisan ticket. A measure providing for State-wide prohibition was carried. In 1916 a Democratic governor, Ernest Lister, was reelected and the vote for President went to Wilson by a narrow margin. Senator Poindexter, Republican, was elected to the Senate by a record majority, and the entire Republican State ticket except the governor was elected. A strike in the shipyards, involving 25,000 workmen, occurred in Seattle in 1919. In 1920 the Republican vote elected Louis F. Hart governor. For President, Harding received 223,137 votes, Cox, 84,298. In 1922 C. C. Dill, Democrat, was elected to the Senate. On Nov. 12, 1923, the United States Supreme Court sustained the State laws prohibiting the ownership of agricultural lands by Japanese and other aliens ineligible

to citizenship. For President, Coolidge received in 1924, 220,224 votes; La Follette, 150,727; Davis, 42,842. Ronald H. Hartley, Republican, was elected governor. In a conflict over the direction of the State University, Hartley caused the removal of its president, Dr. Henry Suzzalo, in 1926. For President, in 1928, Hoover received 335,844 votes; Smith, 156,772. Governor Hartley was reelected. A 7.79-mile tunnel of the Great Northern Railroad system through the Cascade Mountains was bored through in 1928.

Legislation. The Legislature passed a minimum wage act which went into effect on Feb. 20, 1915. In 1917 the Legislature adopted a "bone dry" prohibition amendment. It also passed measures substituting life imprisonment for the death penalty, unless the jury in addition to the verdict of guilty found that the death penalty should be inflicted. The Legislature created a State Safety Board with legal aid boards to investigate industrial accidents. It also enacted measures against criminal syndicalism and sabotage. In 1923 the sale of narcotics was made a felony. An executive-budget law was enacted in 1925. A constitutional amendment to subject different classes of property to different rates of taxation was submitted in 1927, but rejected by popular vote in 1928.

WASHINGTON, STATE COLLEGE OF. A co-educational State institution at Pullman, Wash., founded in 1890 under the National Land Grant Act. The student enrollment increased from 1184 in 1914 to 3344 in 1927-28, and the summer-session enrollment in 1928 was 390. The members of the faculty for 1927-28 numbered 292, as compared with 264 in 1923-24. During the period 1914 to 1927-28, the yearly income increased from \$458,000 to \$1,849,067, while the Land Grant Endowment Funds amounted to \$2,690,778 in 1928. The library was increased from 90,000 bound volumes in 1914 to 145,000 in 1928. During the period under review, David S. Troy Hall for the dairy department, three dormitories for women, one for men, several farm buildings, a gymnasium, a hospital, and a home economics building, were constructed. President, Ernest O. Holland, Ph.D.

WASHINGTON, UNIVERSITY OF. A coeducational State institution of higher learning at Seattle, Wash., founded in 1861. In 1914 student enrollment was 1888; the faculty numbered 194, and the library contained 64,000 volumes. In 1928 the total enrollment reached 7282; the faculty had increased to 350 members; and the library contained 249,208 volumes. During this period, the schools of business administration, library, economy, and fisheries were opened. Education Hall, Home Economics Hall, Commerce Hall, Philosophy Hall, the forest products laboratory, the mines laboratory, and a stadium seating 30,000 were built. In 1925 Alfred H. Anderson Hall for the college of forestry was opened, and a library was completed in 1926. The following year, the Henry Memorial Art Gallery was opened and a gymnasium for women was erected. An athletic pavilion for men was completed in 1928. The university received a gift of the Boeing Aerodynamical Laboratory in 1919, and a gift of \$250,000 for a building for the college of forestry in 1923. Requirements for entrance and scholarship standards were raised in 1921. President, M. Lyle Spencer.

WASHINGTON AND JEFFERSON COLLEGE. A nonsectarian institution of higher education at Washington, Pa., founded in 1802.

The student enrollment in 1915 was 326, as compared with 499 in 1928. The faculty numbered 21 members in 1915 and 40 in 1928, and the library, in the same period, was increased from 26,000 to 40,763 volumes. The endowment was approximately \$1,500,000 in 1928. In 1926 and 1927, the main building and other facilities were completely overhauled and modernized, including equipment. President, S. S. Baker, LL.D.

WASHINGTON AND LEE UNIVERSITY.

A nonsectarian institution of higher education for men at Lexington, Va., founded in 1749 maintaining departments of liberal arts, commerce, engineering, and law. The student enrollment increased from 492 in 1914 to 910 in 1928. During the same period, the faculty increased from 26 to 56 members. The permanent endowment of the university in 1928 was \$1,390,047, and there were 65,000 volumes in the library. A dormitory was built in 1920, and a chemical laboratory, costing \$150,000, was opened in 1924. Within the period 1914-1928, two years of college work were made requisite for admission to the law school; departments of education, electrical engineering, and public speaking were opened; a campaign was carried on in the South to raise \$500,000 to reestablish the school of journalism of the university, which was founded in 1869 while Gen. Robert E. Lee was president; and the United Daughters of the Confederacy raised \$150,000 for a Lee Memorial Chapel. President, Henry Louis Smith, Ph.D.

WASHINGTON CONFERENCE. The possibility of the nations' disarming has been a favorite theme of prophets and poets. The Hebrew prophets told of a time when nations would "beat their swords into ploughshares and their spears into pruning-hooks." Tennyson sang of the day when "the war drum throbs no longer and the battle flags are furled." After the Paris Conference, however, the reduction of expenditures for armaments was the concern of statesmen, and some real progress was made. The great naval Powers actually put a limit on capital ships, and European states even discussed a treaty to limit land armaments.

Senator William E. Borah of Idaho was more than any other individual responsible for the calling of the Washington Conference, and his activities were at first viewed with some suspicion by President Harding and Secretary Hughes. On Dec. 14, 1920, Senator Borah introduced in the Senate a resolution which became part of the Naval Appropriation Bill of 1921. The President was authorized and requested "to invite the governments of Great Britain and Japan to send representatives to a conference, which shall be charged with the duty of promptly entering into an understanding or agreement by which the naval expenditures and building programmes of each of said governments . . . shall be substantially reduced annually during the next five years to such an extent and upon such terms as may be agreed upon." Executive opposition could not keep this provision out of the Naval Bill, but how far the agitation in Congress and the country forced the executive to reluctant action and how far it was simply pressure on a door which had begun to swing open, it is difficult to say. On July 10, 1921, the State Department issued a proclamation announcing that a conference was to be called. Great Britain, Japan, and the United States were the principal naval Powers, but before they could agree on limitation, there

had to be a full discussion and agreement on the political situation in the Pacific. Policy and armament go hand in hand. Preparedness is only half-preparedness if not measured according to the demands of a nation's foreign policy. President Harding appointed as the American representatives Secretary Hughes, Elihu Root, Senator Lodge, leader of the Republican majority in the Senate, and Senator Underwood, leader of the Democratic minority. Apparently, President Harding, unlike Wilson in the case of the Treaty of Versailles, was ready to placate the Senate in advance. The Conference began on Nov. 12, 1921, and lasted until February, 1922. Seven treaties were adopted:

(1) A treaty between the United States, the British Empire, France, Italy, and Japan with respect to the limitation of naval armament

(2) A treaty between the same powers in relation to the use of submarines and noxious gases in warfare.

(3) A treaty between the United States, the British Empire, France, and Japan relating to their insular possessions and dominions in the Pacific Ocean.

(4) A declaration accompanying this treaty.

(5) A treaty between the same four powers supplementary to the above

(6) A treaty between the United States, Belgium, the British Empire, China, France, Italy, Japan, the Netherlands, and Portugal relating to policies in matters concerning China

(7) A treaty between the same nine powers relating to the Chinese customs tariff.

In addition, 12 resolutions were adopted relating to such matters as proposals for the amendment of the laws of war; extraterritoriality in China; reduction of Chinese military forces; the Chinese Eastern Railway; and radio stations and foreign postal agencies in China. The most spectacular result of the conference was the Five-power Naval Treaty which established a 5-5-3 ratio for the capital ships of the United States, Great Britain, and Japan, and maintained the *status quo* in respect to American and Japanese fortifications in the Pacific. This treaty was in large part due to the important speech which Secretary Hughes made at the opening of the conference. He not only urged disarmament with an eloquence which recalled President Wilson's utterances, but he had a definite scheme which the United States approved and which, at the same time, was not unfair to Great Britain and Japan. He suggested the following four principles.

1. All capital shipbuilding programmes, either actual or projected, should be abandoned.

2. Further reduction should be made through the scrapping of the older ships.

3. In general, regard should be had to the existing naval strength of the powers concerned.

4. The capital-ship tonnage should be used as the measurement of strength for navies, and a proportionate allowance of auxiliary combatant craft should be prescribed.

This scheme entailed the scrapping of 1,878,073 tons, or 60 capital ships—30 for the United States, 23 for Great Britain, and 17 for Japan. Some modifications of detail were made, largely because of Japanese reluctance to agree to the ratio. Japan was finally permitted to retain the *Mutsu*, one of the most powerful ships afloat; but it was a Pyrrhic victory, for in compensation Great Britain was allowed to build two super-dreadnoughts, and the United States got the right to complete two battleships of the *West Virginia* class. This bargain, however, was rather costly in money to Great Britain and the United States.

Some naval strategists maintained that the capital ship was obsolete; if that were so, its

limitation was little more than a magnificent gesture. The limitation of capital ships, furthermore, it was contended, would really cause an increased construction of smaller vessels, and these the conference failed to limit. Indeed, the naval programmes of the Powers, following 1922, already began to compete in ships which the treaty did not cover. Archibald Hurd, one of the most distinguished naval experts of England, declared that one of the results of the conference would be to "set up a higher standard for submarines, placing on each nation what amounts practically to an obligation to continue building submarines." Here, probably, was the most conspicuous failure of the conference. The submarine, "the criminal of the seas," which was directly responsible for the entrance of the United States into the War, was turned loose with a certificate of good conduct.

Article I of the treaty on the subject authorized the use of the submarine under certain specified conditions as a commerce destroyer. Article IV, however, declared that the signatory Powers recognized the practical impossibility of using the submarine as a commerce destroyer. There were ambiguities in the treaty which seemed likely to cause difficulty in the event of war, and meanwhile there was no limitation. Great Britain was anxious to act drastically, but France, on account of her strategic position, wished to retain the submarine as a weapon. France was excluded from the meetings in which England, the United States, and Japan deliberated on the naval holiday; and she was not notified of the decisions until they were accomplished facts. The American delegation might have been more diplomatic in this respect, since France's co-operation was necessary if submarines were to be successfully dealt with, to say nothing of the interests of the United States in having France agree to the rehabilitation of Germany. Aircraft, also, was too big a problem for the conference, although in this case their commercial possibilities would make any form of limitation extremely difficult. Another lacuna of the conference was its failure to define a merchant ship in the treaties relating to this subject.

Of the other treaties, one deserves special mention. The United States, Great Britain, France, and Japan agreed "as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean." Article II provided that "if the said rights are threatened by the aggressive action of any other power, the high contracting parties shall communicate with one another fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation." This was the so-called Four-power Treaty. It gave rise to a lively controversy in the United States Senate. In particular, critics did not fail to point out the similarity of this language to that of Article X of the League of Nations Covenant. One serious question raised by the treaty was whether the phrase "insular dominions" included the Japanese mainland. If it did—and this was the interpretation first given the treaty—the United States would be bound to confer on the measures necessary to protect Japan. The United States might be forced into indirect support of possible Japanese imperialism. There was a difference of opinion between President Harding and Secretary Hughes as to whether Japan proper was included, and as

a result of the ensuing public discussion, a supplementary treaty was drawn up, excluding the mainland from the term "insular possessions and insular dominions." The treaty probably left Japan in a better position in the Pacific than she was before, for American diplomatic freedom of action was limited. The most beneficial result was that the Anglo-Japanese Alliance was canceled. This was one of the principal objectives of the American delegation to the conference, but if, from the point of view of the United States, the Four-power Treaty was considered a winding-sheet for the Anglo-Japanese Alliance, Japan apparently thought that the alliance was extended. Premier Takahashi declared that the "Quadruple Entente, which for Japan replaces the Anglo-Japanese Alliance, is much wider in its bearing and removes all chances of war." Some pledge, however, such as the Four-power Treaty, was necessary to provide moral disarmament before actual disarmament could be achieved. The Four-power Treaty was bound up with the naval pact.

At the conference, China met with both successes and reverses. One achievement of the conference, the Shantung agreement, was a real advance. Direct negotiations had failed. China had little hope of securing assistance from the League of Nations, but in the Washington Conference, she was able to debate the matter with Japan and to receive satisfaction. Two important treaties relating to foreign rights and interests in China and the Chinese tariff failed to give China what she wanted. The United States stood back of China on occasion, but the matters involved were quite technical. The country was much more interested in the naval aspects of the conference, and there was no strong public opinion in the United States in favor of going to her aid and letting China get out of the straitjacket in which imperialistic policies had succeeded in placing her. See CHINA; SHANTUNG; YAP ISLAND; NAVIES OF THE WORLD; ANGLO-JAPANESE ALLIANCE.

WASHINGTON UNIVERSITY. A non-sectarian coeducational institution at St. Louis, Mo., founded in 1853. The student enrollment increased from 1390 in 1914 to 6669 in 1928, the faculty from 208 to 541 members, the library from 142,589 bound volumes and 60,000 pamphlets to 285,654 bound volumes and 78,386 pamphlets. Productive funds increased from \$6,156,223 to \$13,802,548.01 in the same period, the Wilson swimming pool and funds for Wilson Memorial Hall for the department of geology, the latter in memory of her husband, were given by Mrs. Newton R. Wilson; and the Grace Valle January Law School Building and funds for the erection of a building for the school of fine arts were received; by donation of private individuals and of the General Education Board, a school of Medicine was endowed with \$1,600,000, \$100,000 was given by Robert S. Brookings for a residence foundation in Washington, D. C., in connection with the graduate school of economics and government, a chair of history was endowed through anonymous gift; an athletic field house and the W. K. Bixby Hall of Fine Arts were completed, new courses were established in industrial engineering; the Charles Rebstock Hall of Biology and the St. Louis Maternity Hospital were opened; \$1,000,000 was received for Mallinckrodt Radiological Institute; a like amount for an eye, ear, nose, and throat hospital, a women's building and a school of den-

tistry building were completed; and \$600,000 was received for the George Warren Brown Department of Social Work. Acting Chancellor, George R. Throop, Ph.D.

WASSERMANN, vas'ër-man, JACOB (1873-). A German novelist, born at Furth, who has lived much in Austria. He is the author of many works, including: *Die Juden von Zirndorf* (1897); *Geschichte der Jungen Renate Fuchs* (1901); *Der Niegekusste Mund* (1902); *Der Moloch* (1903); *Alexander in Babylon* (1905); *Die Schwestern* (1906); *Caspar Hauser, oder die Tragheit des Herzens* (1908); *Die Masken Erwin Reiners* (1910); *Der Goldene Spiegel* (1911); *Der Mann von vierzig Jahren* (1913); *Das Hansemannchen* (1915); *Christian Wahnschaffe* (1917); *Der Wendekreis* (1920), and several prose essays, *Die Kunst der Erzählung*, *Faustina, oder ein Gespräch über die Liebe* (1912), and *Mein Weg als Deutscher und Jude* (1920). His later works are *Fabian oder die verlorenen Jahre* (1924); *Landin und die Samen* (1925); *Der Fall Maurizius* (1926), and *Aufbruch um den Junker Ernst* (1927). Among English translations of his works are *The Triumph of Youth*; *World's End*, *Wedlock*, *Gold* (1924); *Oberlins Three Stages* (1926); *Caspar Hauser* (1928), and *The Maurizius Case* (1929). He has written also five one-act plays under the title *Die ungleichen Schalen*.

WATER METERS. See WATERWORKS AND WATER PURIFICATION.

WATER POWER. In the years following 1914, there was no more important movement for the development of natural resources than that concerned with making water power available for the use of industry in an economical, convenient, and efficient manner. This was particularly evident with the increased cost of fuel, involved especially in the raising and transportation of coal, and due to the growing demand of industry along with the improved standards of living. This condition held good the world over, and the development of water power in such countries as Switzerland, Italy, and Scandinavia, not to mention North America, was indeed most important. Obviously, it was a subject which required deep interest and supervision even when private capital was employed, for the construction of dams, power plants, and transmission lines, considerable outlay was involved, although the maintenance costs were comparatively low. Naturally, in the years immediately succeeding the World War, it was not always easy to secure such capital in view of government indebtedness, high rates for loans, and often lack of private capital. Nevertheless, in many parts of the world there were important developments, as, for example, in connection with railway electrification in France and in Switzerland, for industrial purposes in Italy, and for general power development in America.

North America contains less than 15 per cent of the water-power resources of the globe, but by the end of 1928 it had developed more water power than all the rest of the world. European countries, particularly Germany, the territory comprised in the former Austria-Hungary, Norway, Sweden, France, Italy, and Switzerland, have developed a relatively larger percentage of their water power, but have not in any way approached the possible. Many of these countries have little or no natural fuel, and consequently with their ever-increasing industrial demands for power, they have been forced to develop their

water-power resources. This is especially true of Italy, which has no native coal but which has expanded industrially.

Japan in 1929 was developing a project of 102,000 horse power in northern Korea in which a 16-mile tunnel has been built to carry the water through the mountains to the water wheels. Russia has recently ordered in the United States four 80,000-horse-power units for a development on the Dnieper River. These are the largest capacity units to date and the plant will eventually contain 10. While Asia, Africa, South America, and Central America all possess water power in varying degrees, much of the territory of these countries has been comparatively unexplored or is not conveniently near markets for power; hence, in their present economic condition, the development of water power is a subject of little interest.

It may be said that North Africa and South Africa, where the rainfall is low, have but limited water-power resources, but tropical Africa, particularly the Congo Basin, with a heavy rainfall, has vast possibilities for the production of water power. Asia, with its vast area and the high altitude of its central part, is inferior in water-power resources to Africa, on account of the low precipitation through northern, western, and central Asia. This subject is comprehensively summarized in "Water Power of the World," Part II, of the *World Atlas of Commercial Geography*, published by the United States Geological Survey (Washington, '921).

Water Power in the United States. For many years, there had been considerable discussion and controversy as to the Federal water powers on streams within its jurisdiction. The matter, however, had not attained important dimensions until the twentieth century, and even then laws passed in 1901 and 1910 on the administration of water power hardly took into consideration the part which electrical power was destined to play in transportation and industry, or the safeguards which the State in the disposition of its important natural resources would be required to make in the interest of the investor as well as of the public. In fact, the rights granted at first were so insecure and the liabilities imposed were so uncertain that it was difficult to finance water-power developments requiring Federal authority, and the result was that American industry was unable to utilize the large water-power resources available to it. The Congress of the United States in 1924 had control over the disposition of some 85 per cent of the potential water power of the nation. This authority depends on three fundamental bases: first, that the United States is owner of the public lands, which may be used only in such manner and for such purposes as Congress may direct; secondly, that jurisdiction over all navigable waters of the United States is given to Congress through its power to regulate commerce, and it also has authority to determine what structures may be erected in or over them and under what conditions; thirdly, the manner in which international waters can be diverted and used, which of course must be the subject of treaty between the nations concerned, and the only power of making and enforcing treaties in the United States belongs to the Government.

In the beginning, Congress left the regulation of navigable rivers, and in a large measure their improvement, to the several States and acquiesced in the construction on such streams of

whatever structures the State laws might authorize. The use of public lands for power purposes also fell under a condition of similar policy, but later, this policy was modified through legislation seeking to preserve the public interest in the power resources under public control. Such legislation, however, did not appreciate the conditions which were necessary if these resources were to be developed for public use. Under the Act of 1901, grants on public lands and reservations were made by the Executive Department, on navigable streams, power grants demanded a special act of Congress. The Act of June 23, 1910, superseding a similar act approved on June 21, 1906, merely fixed the general conditions under which the special grants were made. These acts were considered practical failures, and in order to meet the conditions which had arisen and to provide for the proper requirements of industry, as well as to protect the nation at large, the Federal Water-power Act was passed by Congress and approved June 10, 1920. This Act created the Federal Power Commission, made up of the Secretary of War, the Secretary of the Interior, and the Secretary of Agriculture, together with an engineering, technical, legal, and administrative staff which was authorized to make investigations and to collect and report data concerning water resources and the water-power industry.

The commission was also empowered to issue permits and licenses for the construction, operation, and maintenance of dams, water conduits, reservoirs, power plants, transmission lines, and like projects, such licenses being issued for a period not exceeding 50 years, and prescribing special conditions under which the licensee should operate, including, of course, those that were set forth in some detail in the Federal Water-power Act itself. At the close of the fiscal year ending June 30, 1928, the Federal Power Commission reported that it had received 910 applications since the enactment of the Water-power Act. The accompanying small table gives a summary of several years

Date	Horse Power	Increase	
		Horse Power	Per cent
1921 (Nov.)	7,926,958		
1924 (Mar)	9,080,958	1,160,000 ^a	14.6
1925 (Mar)	10,037,655	950,697	10.5
1926 (Jan 1)	11,176,596	1,138,941 ^b	11.3
1927 (Jan 1)	11,720,983	544,387	4.9
1928 (Jan 1)	12,296,000	575,017	4.9
1929 (Jan 1)	13,571,530	1,275,530	10.4

^a About 2 3 years. ^b About 0 8 year.

From this summary, it will be apparent that the legislation of 1920 not only was needed but was the forerunner of improved and substantial developments. This does not mean that the Federal Power Commission was not involved in controversy or that there was a uniform acceptance by the various States of attempts to exert Federal authority over streams more or less navigable.

Toward the end of 1928, Congress passed a bill authorizing the expenditure of \$165,000,000 for the construction of a dam on the Colorado River at Black Canyon, which the commission of engineers had found more suitable than Boulder Canyon. This authorized the Secretary of the Interior to construct, operate, and maintain a dam for power and irrigation canals, and to construct of cause to be constructed a power plant, which would have a maximum of 1,000,000 horse power or 550,000 continuous horse power. The

operation of the power plant and the distribution of electricity were left to further determination.

At Muscle Shoals on the Tennessee River in Alabama, the Government constructed and has in operation a power plant with units having a total capacity of 260,000 horse power. More units are to be added. The maximum available energy at Muscle Shoals is 610,000 horse power, but this is available only for part of the year. The continuous all-year power is less than 100,000 horse power, which makes necessary the tying into a system containing steam and other hydro plants. This is actually done by the Gov-

ernment selling the output to the system of the Alabama Power Company which distributes the energy.

On the St. Lawrence, it is estimated that approximately 5,000,000 horse power will be available. This project is still in abeyance (1929), pending international agreement between the United States and Canada, also agreement with New York State which claims certain rights in the determination of the development.

A treaty was negotiated in 1928 between the United States and Canada for the preservation of the scenic beauty of Niagara Falls, the provisions of which will make possible additional

diversion of water on both the Canadian and the United States sides. The present installed capacity of the Niagara Falls Power Company in its active plants on the American side is about 450,000 horse power. In addition to this, two old plants, now held in reserve, have 110,000 horse power. On the Canadian side, nearly 1,000,000 horse power is developed in four plants, three of which are operated by the Ontario Hydroelectric Power Commission.

Another outstanding hydroelectric develop-

ment completed early in 1928 is that on the Susquehanna River at Conowingo, Md. This has seven 54,000-horse-power units and four more are to be added later. Although not the largest in capacity, these units are the largest in physical dimensions constructed to date.

The highest-head plant in operation in the United States is Big Creek 2A plant of the Southern California Edison Company, which has impulse wheels operating under a 2418-ft. head. This station contains two 50,000-horse-power units.

WATER POWER

OUTDOOR POWER HOUSE AND SWITCHING STRUCTURE OF A MODERN AMERICAN STATION WITH AN INSTALLED GENERATING

A notable low-head plant is that at Louisville, Ky., which contains eight 13,500-horse-power propeller-type wheels operating on a head that varies from 10 to 37 feet. The Rocky River Plant of the Connecticut Light & Power Co. is unique in that water for operation of the turbines is pumped up 240 feet into a storage reservoir during periods of off-peak steam power and is utilized to generate power through a 42,000-horse-power water turbine during peak-load periods. This is the only plant of its kind in the United States, although several such installations are now (1929) in operation in Europe, notably those in Italy.

Another development in New England worthy of special mention is the "Fifteen-mile Project" on the Upper Connecticut River in which 300,000 horse power will ultimately be produced in two stations. An unusual power plant is the Norwood Station of the Carolina Power & Light Co. in which the complete generating equipment, including generators, transformers, and switches, is of the outdoor type. This is the first plant to employ outdoor generators.

In 1928 in the electric public-utility power plants in the United States, about 34,000,000,000 kilowatt-hours of electricity was produced by the use of water power. To produce this quantity of power by the use of fuel would have required 31,000,000 tons of coal. The electricity produced by the use of water power for public-utility power plants in 1928 was over 40 per cent of the total.

Water Power in Canada. An analysis of the available and developed water power in Canada, according to the Dominion Water Power & Reclamation Service, shows a total available of 20,197,000 horse power for conditions of ordinary minimum flow during the entire year and 33,113,000 horse power for six months. The growth of developed hydroelectric power has been striking. The total installed horse power has grown from 977,000 in 1910 to 5,350,000 by the end of 1928. Of the latter, 445,700 horse power, or 83.1 per cent, is installed in central stations; 573,000 horse power, or 10.7 per cent, in the pulp and paper industry; and the remaining 6.2 per cent in other industrial plants such as sawmills, gristmills, mines, etc. In addition to its privately generated power, the pulp and paper industry purchases 789,500 horse power from the central stations, thus making it the largest industry using power in the Dominion. The largest central-station system in Canada is that of the Ontario Hydroelectric Power Commission, which in addition to its big Queenston Development of approximately 500,000 horse power operates other plants on the Canadian side at Niagara Falls and purchases large blocks of power from private developments in the Province of Quebec.

Water-power developments under construction in Canada (1929) were expected to add approximately 1,200,000 horse power to the total. These include the Beauharnais Project on the St. Lawrence, between Lake St. Francis and Lake St. Louis, which will ultimately contain ten 50,000-horse-power units, and the Bridge River project on the Columbia River which will have an initial capacity of 60,000 horse power and an ultimate of 700,000 horse power.

WATERS, HENRY JACKSON (1865-1925). An American college president and editor, born at Center, Mo., and educated at the University of Missouri and in Germany and Switzerland.

From 1892 to 1895, he was professor of agriculture at the Pennsylvania State College, and from 1895 to 1909, he was director of the Agricultural Experiment Station and professor of agriculture at the University of Missouri. From 1909 to 1917, he was president of the Kansas State Agricultural College and in 1918 became managing editor of the *Kansas City Weekly Star*. He also served as commissioner to the Philippines to report on agricultural and educational development and was a member of several State agricultural boards. During the World War, he was Federal Food Administrator. He wrote *The Essentials of Agriculture* (1915); *The Development of the Philippine Islands* (1915); *Essentials of the New Agriculture* (1924), and *Laboratory Manual of Agriculture*, with J. D. Elliff (1918).

WATER SUPPLY. In the field of domestic water supply, the most important two developments in the period from 1914 have been the construction of aqueducts of constantly increasing length and size, truly stupendous and remarkable works, and in the almost complete eclipse of filtering methods for the removal of bacteria in water supplies by the plan of treatment with chlorine. As would be expected, the United States has occupied a leading position in the construction of great aqueducts and it is also in America that the chlorine method has been most extensively applied.

In early days, many American water supplies were privately owned, and, while many still are, one of the first developments was toward municipal ownership. In the campaign for municipally owned supplies, the slogan was based on the fact that water was an essential for life, and was to the effect that "water should be as free as air." The inevitable result of this policy has been a constant increase in the demand for water. The great difference between the per-capita consumption of water in America and Europe has often been pointed out. Whereas, in many central European cities, 10 to 20 gallons per capita per day suffice, the consumption in America ranges from 75 to 150 with a few notable examples of even greater demand. In earlier days, this demand, although high was much less, and, with small populations could be met at a reasonable expense. Today, with all nearby sources of supply fully developed, the great urban centres have had to turn to distant watersheds for the additional supplies needed to meet these great rates of consumption and the rapid increases in population. Thus, New York City, after fully developing the Croton area, has turned to sources in the Catskills, 70 to 100 miles distant, San Francisco is building her Hetch Hetchy aqueduct 156 miles long to reservoirs in Yosemite Park; Los Angeles is discussing the feasibility of a line almost 300 miles long to the Colorado River; and several New Jersey cities are combining in the construction of a North Jersey supply—only to mention a few outstanding works.

As also was natural, attention was turned, in the face of these great expenditures for additional supplies, to the problem of reducing the great waste of water which such high rates of consumption indicated. It was pointed out that probably 50 gallons per capita per day represented the actual use of water and that any consumption beyond this figure was probably waste. While some of this waste was legitimate and unavoidable, or so costly to locate and control that it was less expensive to permit it to

occur than to attempt to stop it, there was much waste that could be prevented. As a result, numerous water-waste surveys have been made to locate leaky mains, connections, and fixtures, and there also has been much agitation for metering supplies and charging for the actual quantity used rather than by the usual method of a flat rate or fixed amount depending on the number of fixtures, tubs, wash basins, toilets, etc. supplied. While these efforts have had their effect in reducing waste, it has been clearly recognized that the demand is steadily increasing and many cities have paid little attention to curtailing waste.

During the earlier years of the twentieth century, great emphasis was put on the development of coagulation and filtration as a means not only for improving the physical quality of water, removing turbidity, color, etc. and in the improving of hard waters, but also on filtration as a means of removing bacteria dangerous to life. So many American cities were faced with the necessity of securing their water supplies from streams polluted by the sewage of other cities above, that typhoid epidemics forced attention to the necessity for adequate precautions. Indeed, the rapid increase in population made it increasingly difficult to find sources of supply free from pollution. The problem was older in Europe, but it had been answered in large measure by filtration, and America turned with force and determination to the filtration problem.

In the early years of the present century, large sums were expended in building the so-called slow sand filters through which the water flows by gravity. This type was particularly in favor with the large cities and where bacterial efficiency was the principal object sought. Mechanical filter plants, and coagulation and sedimentation basins were typical of the majority of smaller cities where turbidity and chemical improvement were problems. Just before the World War, chemical methods, ozone, chloride of lime, and sulphate of copper, were all being actively studied and experimented with. From these, the chlorine method, whereby small quantities of chlorine are mechanically introduced into the supply, has emerged as the modern process of disinfection. Many of the costly slow-filter plants have been abandoned and the use of chlorine has been widely introduced. It is probably true that this method, although very effective and far less expensive than filtration, has been relied upon in many cases where filtration also is essential to a thoroughly satisfactory supply. In Chicago, for example, probably one of the most backward cities in water supply in America, there is not only an unsatisfactory supply from the standpoint of quantity, caused largely by uncontrolled use and waste (consumption about 275 gallons per capita), but the quality also is frequently bad, due to the fact that the water is highly polluted and is rendered sterile by chlorine the combination of polluting and sterilizing elements making the water far from pleasant. The future will doubtless show a return to filtration in many cases where it is essential for the improvement of physical and chemical properties, as well as the continued and extended use of the remarkable and effective chlorine method of disinfection.

In the details of water-supply construction, as in other construction fields, methods have been marked by the increasing use of labor-saving devices and means of rapidly executing great works, rather than any new developments in de-

sign. While we know of no recent figures on the types of supply now in use in America, it is probably true that there has been a steady trend toward replacing pumped supplies, particularly from ground water sources, by gravity systems wherever this has been possible. Data for the period before 1900 indicated that over half of the American supplies came from ground water sources and European supplies also show a preponderance of such supplies. With the great increases in demand and population in America, such supplies have often become inadequate. They also, while often less expensive in first cost, involve much higher operating and maintenance charges than gravity supplies and it has, therefore, been economical to replace them by the latter type where and when the future of a community became assured, and thus long-life design was justified and could be financed at reasonable cost. Gravity plants, involving small operating charges, also can be more efficiently run by the usual community where political preference seldom insures efficient management of pumping plants.

For the distribution piping in city streets, cast-iron pipe, first introduced about 100 years ago both in London and in Philadelphia, continues to be standard. A recent development in this field is the centrifugal method of casting, a scheme imported from France, whereby a more dense material is secured, thus permitting a thinner pipe to be used. There also has been a tendency toward making this pipe in greater lengths, 16 feet, for example, instead of the older 12-foot standard.

Among the important great aqueduct works of recent years, the following are particularly notable.

Greater New York Water Supply. Although construction was begun in 1907, it was not until the later months of 1915 that the first water from the Catskill system entered the city, and not until May, 1917, that the new system was in full use. From the Ashokan Reservoir, an artificial lake 12 miles long for storing the waters of Esopus Creek, the aqueduct extends 92 miles to the city limits and 35 miles within the city. The magnitude and cost, the complexity, variety, and difficulty of the physical problems encountered, mark it as the greatest water-works man has ever built.

Notwithstanding the large capacity of the new supply, it was clearly understood that it was merely a step in the continued problem of furnishing additional supply to meet the constantly increasing demand and population. While the new aqueduct between the Catskills and the city was built of larger size than immediately necessary, and would therefore suffice for a number of years, it was necessary not only to continue to develop additional sources of supply in the Catskill region but also to provide increased distributing facilities, particularly in the Long Island and Staten Island sections which were rapidly growing.

The first additional source of supply was that furnished by the Scholarie watershed, immediately north of the Esopus. Water collected back of the Gilboa Dam, constructed in this new area, was led into the Esopus by means of the 18.1-mile Shandaken Tunnel, which was dug in record time, was opened in 1924, and is the longest continuous tunnel in the world. Excavation was accomplished both from the portals and from six intermediate shafts. It is concrete lined and of

a horseshoe section, $11\frac{1}{2}$ feet high by $10\frac{1}{4}$ feet wide. A maximum capacity of 600 m.g.d. (million gallons daily) was allowed for in the design.

In 1927 an additional supply of 600 m.g.d. was recommended from tributaries of the Delaware River within New York State and 100 m.g.d. from Rondout Creek, a tributary of the Hudson, just south of Esopus. These new plans involve five reservoirs on the Delaware tributaries and one on Rondout Creek. In addition, it is proposed to construct a new aqueduct leading from the new collecting area to the West Branch reservoir in the Croton watershed. This would permit some 100 m.g.d. to be diverted from the high-level sections of the Croton area (which is a low-level supply compared to the Catskill system and is now used for the lower levels of the city) into the new aqueduct and thus to Kensico and Hill View reservoirs of the Catskill system. Investigation of legal and other difficulties are under way for these additional works for which it is estimated there will be urgent need by 1935. Consult *Engineering News-Record*, Aug. 11, 1927.

One of the most interesting features of the Catskill system was the main distributing tunnel, deep under the city, from the shafts of which the supply finds its way into the usual cast-iron mains under the city streets. In October, 1928, contracts were awarded for the Catskill Water Supply System Tunnel No. 2, in New York City. This great work (\$42,692,867) is practically a duplication of Tunnel No. 1, on an easterly location. No. 1 runs south from Hill View Reservoir on the high ground east of Van Cortlandt Park, crossing under the Harlem River below High Bridge, and extending southward for the entire length of Manhattan Island and under the East River to Brooklyn. The new tunnel, No. 2, turns eastward from Hill View Reservoir and southward, approximately on the line of the Bronx River, passing under Randall's Island to Steinway Avenue, Queens. It continues southward through Brooklyn and joins Tunnel No. 1 near Fort Greene Park. This new work will have a diameter of 17 feet and will be constructed at depths of 250 to 700 feet below the surface with outlets to the city distributing system from shafts rising from the tunnel level. It is estimated that construction will take about six years. Consult *Engineering News-Record*, Mar. 31, 1927.

In the meantime, much work has been done in extending the existing distribution system in south Brooklyn and Staten Island. Another line was added to the original 36-inch cast-iron pipe which crossed the Narrows from South Brooklyn to Staten Island and the terminal, Silver Lake Reservoir. The new line was 42 inches in diameter and 9400 feet long and was placed in a trench, excavated in the channel bottom, by means of a long inclined "ladder" from special scows—the greatest submarine pipe-line work of this kind ever undertaken.

In connection with this and other Brooklyn lines, an extensive use was made of riveted-steel pipe—an unusual type for water-supply distribution. Sizes from 66- to 72-inch diameter were employed and the lines included not only the connections from Shaft 23 at Flatbush and Third avenues, Brooklyn, to the new Narrows "siphon," but also the 16,800-foot Mt. Prospect conduit extending from Shaft 24 at Fort Greene Park to the Flatbush district.

Los Angeles Water Supply. Not satisfied with the record aqueduct 240 miles long con-

structed in 1908-13, the Los Angeles authorities have had investigations under way to determine the feasibility of an even longer line (about 300 miles) to secure a supply from the Colorado River. Nearly \$1,000,000 has been expended on surveys and studies alone for this great supply, a sum sufficient to build a fair-sized system, and plans for the remarkable work, which will bring some 970 m.g.d. to Los Angeles, sufficient to supply the demand for 50 years, are now awaiting final action.

San Francisco Water Supply. The Hetch Hetchy project is still under construction. After many years of discussion and plans, the city of San Francisco started this much-needed water supply development in 1919 by awarding the contract for the Hetch Hetchy, or O'Shaughnessy, Dam, situated on the Tuolumne River in Yosemite Park about 150 miles east of the city. From the reservoir thus formed, water is to be carried to San Francisco and the metropolitan district by means of a system of aqueducts with an ultimate capacity of 400 m.g.d. At the same time, due to the height of the reservoirs in the mountains, there has been developed 200,000 hydroelectric horse power. The aqueduct has been constructed in sections, the first or Mountain section beginning at Early Intake and extending, after a short open canal, in a tunnel through the mountains 183 miles to Moccasin Creek, where the power plant is located. The Foothill division has about 17 miles of aqueduct from Moccasin Creek to Oakdale Portal, and then there are 45 miles of steel pipe across the San Joaquin Valley to Tesla Portal. The Coast Range tunnel extends 31 miles to the east of San Francisco Bay at Livingston Gate House, where the line divides in three, the main portion extending westerly under the bay through a pipe line of 200 m.g.d. capacity to the San Francisco peninsula, another section going to the east bay cities, and the third southwest to San José. The new aqueduct, by means of a connection of 23 miles between the Alameda Creek and the Crystal Springs reservoir of the Spring Valley Water Company, is to be connected with that system. The Hetch Hetchy supply is thus made available through the Spring Valley system as required, so that the distribution facilities can be used so long as they are adequate.

It is expected that the supply will reach the city by 1932. The upper section to the Moccasin power plant is finished and this plant is bringing in a revenue of about \$2,000,000 a year. The San Francisco Bay section also is complete, tunnels through the Coast Range are practically finished, and the bond issue for the San Joaquin pipe line has been authorized.

Mokelumne Water Supply. This project, under construction in 1929, is one of the most interesting of recent supplies. It is planned to deliver water from the Mokelumne River, through a 95-mile conduit, to cities on the east side of San Francisco Bay. The aqueduct consists in large part of a steel pipe line 65 inches in diameter, the lower levels of which are under a head of about 500 feet. Electric welding has been used for the first time in forming the longitudinal joints in this pipe which has a maximum thickness of one-half inch. This new departure is being watched with great interest by engineers as it is a pioneer experiment in the development of electric welding (see article BRIDGES). While the long pipe line is complete, the project has been held up by legal difficulties

and the connecting tunnels and dam was not completed in 1930.

Springfield. This Massachusetts city in 1929 enlarged its municipal water-supply system by the construction of Cobble Mountain Dam and Reservoir on Little River above Westfield, the main outlet being a 7000-foot tunnel which also was to furnish water to a hydroelectric plant, located on the river, with an estimated output of 30,000 kilowatts. The supply line, 6 miles in length, consisted of a pipe, 48-54 inches in diameter, formed of two semi-circular plates welded together in 30-foot lengths with riveted, butt-strap, and transverse-field joints. The dam, of the hydraulic-fill type, rose 245 feet above the ledge in the stream and had a total volume of 1,800,000 cubic yards with capacity to impound 22,250,000,000 gallons of water. The Massachusetts Legislature in 1928 authorized \$6,500,000 in bonds to enable the city to construct this system.

Boston. A critical situation has also arisen in the metropolitan system and some temporary, additional supply has been brought in pending the completion of the \$65,000,000 project now under construction for bringing in a new supply from the Swift and Ware rivers. Work is under way on a 14-mile tunnel westward from the existing Wachusett Reservoir, on the Nashua River, to the Ware River and this will be extended to the Swift River, a total length of 2½ miles. Flood flows of the Ware will be temporarily diverted to the Wachusett Reservoir, but later will flow first to a reservoir on the Swift River, and then by the tunnel to Wachusett.

Wanaque Aqueduct. The North Jersey District Water Supply Commission, which, in 1929, had under construction a 25-mile aqueduct as well as the huge Wanaque earth dam, completed the dam but ran into difficulties in connection with the aqueduct. It would appear that three groups of the eight cities represented in this commission (Newark, Kearney, Montclair, Bloomfield, Glen Ridge, Passaic, Paterson, and Clifton) had different ideas as to the possible effect on the aqueduct pressure of the various proposals for aerating the supply. At last reports, a settlement had been reached and the construction of the aqueduct was expected to go rapidly forward. The Wanaque Dam forms a reservoir 6 miles long and 1 mile wide, with a capacity of 28,000,000 gallons, and is expected to supply 100 m.g.d. It is a huge earth structure and a notable piece of construction.

Chicago. The supply of this city is totally different from the above-mentioned types of supply, for it pumps its water from Lake Michigan. There was under way in 1929, a new intake crib and tunnel construction. The so-called Two-Mile Crib, built 1865-67, was the earliest of the city's crib intakes, by means of which water from the lake is admitted to an intake tunnel from which in turn it is pumped into the supply system. A new 3-mile tunnel in rock at about 150 feet below water level extends out from the shore to the new crib. While earlier works were built in earth at less depth, in the more recent tunnels the plan of keeping the excavation in rock by going to greater depths has been followed. It is expected that the tunnel will be continued some 12 miles in length inland from the shore, and will improve supply conditions in the northern half of the city. Tunnel excavation had been under way for some time, but the new steel

crib, which was built near the Navy Pier and is 90 feet in diameter at the base, 70 feet at the top, and 45 feet high, was not launched and floated into position until the summer of 1928.

Miscellaneous Works. Among other American works of interest, although of smaller scale, is the new supply line for Washington, D. C., which practically parallels and replaces the notable old aqueduct built by General Meigs in 1863. Cabin John Creek is crossed by a siphon instead of the old stone-arch bridge which was for so many years the most famous American arch. The line is only 9 miles long from the Great Falls of the Potomac to Dalecarlis Reservoir.

Kansas City, Mo., also has constructed an interesting supply with a tunnel under the Missouri River, which carries the filtered water from the Kansas side to the city pumping stations. St. Louis also has augmented her supply with a 16-mile, 60-inch pipe line to the Missouri River. Tulsa, Oklahoma, built in 1924, a 55-mile line, largely 54- to 60-inch reinforced concrete pipe and perhaps the longest line of its kind in the world, for water supply.

Apulian Aqueduct. One of the longest aqueducts in the world, including some 152 miles of main trunk and 841 miles of main and subsidiary branches or a total length of supply conduits of 993 miles, was put into service in 1924 in southern Italy. This project, which as regards total length is comparable with the Coolgardie pipe line in Australia, is 350 miles long and may be compared, in length but not in size, with the Los Angeles aqueduct, the longest in America, about 240 miles long. It was constructed to supply some 266 communities with a population of about 300,000 people, scattered over some 8100 square miles, and included in the ancient Apulia on the eastern or Adriatic slope of the Apennine Peninsula.

This work had been under construction since about 1907, and involved a main-trunk conduit beginning at the Caposele Springs at the head of the Sele River on the western slope of the Apennines, and extending in an easterly direction piercing the Apennine Mountains by means of a series of 38 grade tunnels, aggregating almost 50 miles in length. At a point 15 miles away from the Adriatic coast, the main aqueduct turns southeast and runs practically parallel with the coast for about 90 miles until it reaches Villa Castelli in the Province of Lecce. For this portion of the aqueduct, the construction was largely a cut-and-covered conduit. The total length of the main-trunk aqueduct is 244 kilometers (152 miles), and in this are included 99 tunnels of about 67 miles total length, about 76 miles of cut-and-covered conduit, 93 aqueduct approaches, having a total of 4.25 miles in length, and six siphons, having a total length of 4.6 miles. From the main trunk, branches were built to such towns and districts as Foggia, Bari, Brindisi, Toranto, etc. A very complete series of articles on this work appeared in the journal, *Engineering* (London), in 1928.

Winnipeg Aqueduct. A different type of aqueduct was this important water-supply system put under construction in 1913 and completed so that in 1919 the first water could be passed through. The country traversed is generally flat and the aqueduct is 80 miles in length from the intake at the lake reservoir to within 17 miles of Winnipeg. It is built of

concrete pipe and arch sections and has a nominal capacity of 85 m.g.d., though this is exceeded. See WATERWORKS AND WATER PURIFICATION.

WATERWAYS. See CANALS.

WATER WHEELS AND TURBINES.

Modern water wheels are divided into three main types, namely, the reaction turbine, the impulse wheel and the propeller type turbine. In the reaction turbine, often designated as the Francis type, water enters around the periphery of the runner, reacts on the vanes and discharges inward to a central draft tube. This type is used up to very large capacities and sizes—the 70,000 horse power units of the Niagara Falls Power Company, representing the greatest capacity in operation up to 1930, although four units of 84,000 horse power rating under a 116-foot normal head at that time were building for the Dnieper River project in Russia. It was expected that these latter units each would develop over 100,000 horse power under a maximum head of 123 feet. These units represented the record capacity to 1930. The 54,000 horse power units in operation at Conowingo on the Susquehanna River are the largest in physical dimensions, although of somewhat smaller capacity owing to operation at a lower head, 89 feet.

Reaction turbines are used on low and moderately high heads, the highest head so far employed with this type being 861 feet at Waterville, N. C. Incidentally, this was the highest head plant in the eastern part of the United States. Another high head installation employing this type of turbine was in operation at the Oak Grove, Oregon, plant of the Portland Railway Light & Power Company. This operated under an 850-foot head.

Efficiencies of over 90 per cent are common with the reaction-type of turbine, and a maximum efficiency of over 93 per cent was reported at the Big Creek No. 8 Plant of the Southern California Edison Company. An important factor in the increased efficiency of reaction turbines has been the attention given in late years to the design of draft tubes so that the water leaving the turbine will do so with a minimum of turbulence.

In the impulse wheel, known as the Pelton type, the water is converted into velocity before impinging tangentially on the buckets of the wheel. Impulse wheels are especially adapted to high heads, although they are also used for moderate heads. Many high-head impulse wheels are to be found in operation on the Pacific Coast. One of the highest head plants in service in that section is Big Creek No. 2-A of the Southern California Edison Company, where two 56,000-horse power, double, overhung units are operating under a head of 2200 feet. These units were reported to have developed a maximum of 70,000 horse power each over considerable periods. Efficiencies of impulse wheels are somewhat lower than those of reaction turbines, 85 per cent representing good practice with the former, as against over 90 per cent with the latter. Impulse wheels are generally of the horizontal type, and reaction wheels vertical. In some cases double impulse wheels have been employed, one on either side of the generator.

The propeller type, developed in Europe by Kaplan and in the United States by Nagler, employs a wheel similar to a ship's propeller. This type is adapted especially to low and variable heads up to 60 feet and to high speeds. It is now

finding wide application. The largest propeller type wheels as to physical dimensions installed in the United States are those employed at Louisville, Kentucky, where the head varies over a range from $7\frac{1}{2}$ to 37 feet. The plant contains eight 13,500-horse power units. This installation is unusual in that there is on the average forty days during the year when high water makes it impossible to generate any power whatever; therefore, the plant is used as a part of a system for the generation of secondary power.

In some instances adjustable blades have been employed under the control of the governor. This permits more efficient use of a variable flow under a variable head. An interesting application of the propeller type, as mentioned in the 1929 *Progress Report of the Hydraulic Division of the American Society of Mechanical Engineers*, is the Back River project of the Montreal Power and Light Company. Here two units have been built with injectors which are expected to increase the output of the machines approximately 1000 horse power each during periods of high water.

The increased economy of large steam plants, the opening up of large natural gas plants in certain sections, and the fact that most of the lower cost water power sites have been developed, has reacted for the present to retard water power development to some extent in the United States, although hydroelectric development is active in the Eastern Provinces of Canada. This competition from steam power is being met by attempts to lower investment costs in hydro plants and to increase the efficiency of units.

One effort in this direction has been the outdoor type of hydroelectric plant. A notable installation of this type is the Norwood Plant of the Carolina Power & Light Company, put into operation during 1928, where the water wheel units instead of being housed in a building are placed outside, with the generators inclosed in plate steel casings that are removable by means of a gantry crane.

Progress in the art of welding has also been a factor in the building of large turbine units, where through the use of steel plates and angles, rotors, stators and casings can be built up to replace heavy castings and thus greatly reduce the weight involved as well as the cost. This will make it possible to construct still larger units in the future. In Europe, and to some extent in the United States, welded pipe is being used extensively for penstocks. Finally, increased attention is being given to research in both the turbine design and the related structures, in which model testing and the testing of units under operating conditions is playing an important part.

A hydroelectric plant that is quite unusual and has attracted considerable attention is the Rocky River development of the Connecticut Light and Power Company, which went into service in 1928. Here the water is pumped up into a large reservoir by two 8100 horse power motor-driven pumps operated by off-peak power from a steam station on the system. This water is then utilized during peak periods through a 33,000 horse power vertical shaft water wheel, operating under a 240-foot head. The overall efficiency of the pumps and water wheels amounts to slightly over 60 per cent. The water is used a second time in another hydro plant on the Housatonic river below the Rocky River plant. Although this is the only plant of its kind in the United States, the

principle has been applied in several instances in Europe.

There are some types of water wheels other than those previously mentioned which were used extensively in the earlier periods but are now employed only under very special conditions. Among these may be mentioned the current wheel in which large paddles dipped into the stream and were turned by the velocity of the current. These were used largely for raising water for irrigation, but had extremely low efficiencies. The undershot wheel with an inclosed flume and later the overshot wheel were outgrowths of the current wheel and were extensively used on low heads for driving mills during the middle of the nineteenth century. A few isolated installations are still to be found. Fairly good efficiencies of 50 to 60 per cent were obtained by some of the better wheels of this type.

Tidal power has also been employed on a small scale in some favored locations where the rise and fall of the tides is large. In these cases the gates are open on the incoming tide and the water is impounded in a reservoir. On the receding tide the gates are closed and the water allowed to flow through water wheels. By employing a series of reservoirs, which can be used alternately, continuous power is obtained. A large development of this character was projected on the Passamaquoddy River, Maine, near the Bay of Fundy, but no construction work had been undertaken up to 1930. Such a plant on a large scale involves a high investment cost per unit of power delivered. A similar tidal project was projected on the coast of Brittany for the development of about 5000 horse power. A small tidal plant is still in daily operation at a mill not far from Boston.

Wave motors form another source of power which occasionally receives popular attention. A few experimental installations have been built involving the use of large floats, which in rising with the waves impart power mechanically through a train of gears to a shaft. It has been found, however, that the ratio of the power obtainable to the investment cost is too small to warrant its commercial application. See WATER POWER.

WATERWORKS AND WATER PURIFICATION. In number of places and number of population supplied, as well as in general efficiency and vital relations to the health and safety of the public, waterworks lead among the municipal enterprises of the United States. The number of municipalities served with public water supplies in 1929 was unknown, but taking into account the rate of growth indicated by the various issues of *The Manual of American Waterworks* (1897, the latest), *The McGraw Waterworks Directory* (1915), and information gathered by *Engineering News-Record* in 1928, it may be assumed that over 10,000 places have public water supplies, including many with populations under 500.

A few hundred of these places were supplied from works outside their boundaries owned either by other municipalities or by private companies. In number of separate municipalities supplied, the Hackensack Water Company held the lead; it supplied some 50 different municipalities in northeastern New Jersey. A much larger population, although fewer separate municipalities, was supplied by State-built works in the Boston metropolitan district, operated under the direction of the Metropolitan District Commission. Both the first cost and operating ex-

penses of these works are met by the municipalities, to which the water is delivered wholesale by meter measurement. After 1920 water districts embracing a number of municipalities increased rapidly.

By far the greater part of the entire water supply in most countries of the world is drawn from surface sources, but considerable areas are favored with underground water drawn from springs and wells, some of the latter tapping artesian sources. Broadly speaking, water supplies drawn from surface sources are subjected to some degree of purification—filtration in Europe and largely also in the United States and Canada, with chlorination widely used in the two latter countries and steadily being introduced elsewhere as a finishing process or insurance against stray disease-producing bacteria that may have escaped the filters. Chlorination is also extensively used in the United States where filtration has not been introduced. The chlorinating plants are relatively inexpensive in both first and operating cost. More than 50 of these were installed on the New York water supply, they ranged from capacities of many hundred million gallons a day on the Catskill Aqueduct supply down to small plants in other parts of the waterworks system. In 1929 New York City, Boston, San Francisco, Los Angeles, Portland, and Seattle were exceptional among larger American cities in not having filtration plants for their surface water supplies drawn from streams, and so are Chicago, Milwaukee, and Duluth among the cities on the Great Lakes. Nearly all the filtration plants of later construction in the United States and Canada have been of the rapid or mechanical type, as compared with the slow sand filters most commonly used in England and introduced quite largely in the United States from the early 1890's onward for some 10 or 15 years. Water softening, long common in England, was introduced somewhat sparingly in the United States but latterly was adopted in connection with a number of the mechanical filtration plants. In the case of some underground water supplies, aeration and filtration plants were built for the removal of iron and manganese.

Aside from the rapid introduction of chlorination and the increase in filtration plants, the most notable change in waterworks systems during the decade was the substitution of centrifugal for reciprocating pumps. The centrifugal pumps, except in the rare cases where water power is directly available, are most frequently driven by steam turbines; but many of the later installations of centrifugal pumps are electric-driven. Cast iron remained by far the most widely used material for water-pipe distribution systems, but for supply mains from source to city and large trunk mains within, steel and concrete gained in use after 1915 while in some localities wood-stave pipe, introduced much earlier, continued to be used on old and new installations. To keep down waste and to distribute justly the cost of the service according to the volume of water wasted and used, meters were becoming more and more common; many cities had practically all consumers metered. Besides enlargements constantly in progress in thousands of cities, notable additions were being made in 1929 to the water-supply systems of Boston, New York, Albany, Detroit, St. Louis, San Francisco, Oakland, and other large cities of the United States and to the waterworks of Ottawa and To-

routo, Canada, while immense additional supplies were projected for New York, Rochester, and Los Angeles.

WATSON, JAMES E. (1864-). An American public official, born at Winchester, Ind., and educated at De Pauw University. He began the practice of law in 1886 in his father's office. He was Representative from Indiana in the Fifty-fourth, Fifty-sixth, and Sixtieth Congresses. In 1916 he was elected United States Senator to fill the unexpired term of Benjamin F. Shively, deceased, and was reelected for the terms of 1921-27 and 1927-33. He was chairman of the Senate Committee on Interstate Commerce.

WATSON, JOHN (1847-). A Canadian professor of philosophy (see Vol. XXIII). He published a volume of political philosophy, *The State in Peace and War* (1919), and in 1922 was honored by a collection of testimonial essays written by his former students.

WATSON, JOHN BROADUS (1878-). An American psychologist (see Vol. XXIII). He resigned from the faculty of The Johns Hopkins University in 1920. In 1921 he joined the staff of the New School for Social Research (New York City), and lectured on behaviorist psychology. His work on *Psychology from the Standpoint of a Behaviorist* (1919) was instrumental in directing a movement on the part of American psychologists away from introspection to the empirical observation of external behavior. See BEHAVIORISM. Among his more recent works are *Behaviorism* (1925); *Psychological Care of Infant and Child* (1928); *The Ways of Behaviorism* (1928). He was editor of the *Journal of Experimental Psychology* (1915-27).

WATSON, THOMAS EDWARD (1856-1922). An American politician and writer (see Vol. XXIII). In 1916 he was for the third time tried for the publication of three chapters in his book, *The Roman Catholic Hierarchy*, and was finally acquitted. In 1917 he opposed conscripting soldiers for service abroad, and his magazines were barred from the mails. He was elected U. S. Senator from Georgia for the term 1921-27. See *Life of Thomas E. Watson*, by W. W. Brewton (1926).

WATSON, THOMAS LEONARD (1871-1924). An American geologist, born in Chatham, Va., and educated at the Virginia Agricultural and Mechanical College and later at Cornell University. During 1892-95 he was instructor in geology at the Virginia Agricultural and Mechanical College and during 1904-07, professor there. Meanwhile (1901-04), he held the chair of geology at Denison University and (1907-10) that of economic geology at the University of Virginia, where, after 1910, he was also head professor of the school of geology. In addition to many articles on geological subjects contributed to various journals and reports of surveys with which he was connected, he was associated with H. Ries in the authorship of *Engineering Geology* (1914) and *Elements of Engineering Geology* (1921).

WATSON, SIR WILLIAM (1858-). A British poet and epigrammatist (see Vol. XXIII). He was created a knight in 1917. His later publications include, *Pencraft: A Plea for the Older Ways* (1916); *Retrogression* (1916); *The Man Who Saw the Superhuman Antagonists* (1919); *Ireland Unfreed* (1920); *A Hundred Poems* (selection, 1922); *Poems Brief and New* (1925); *Selected Poems, with Notes* (1928).

WATTS, MARY STANBERY (Mrs. MILES TAYLOR WATTS) (1868-). An American novelist (see Vol. XXIII). Her later works include *The Boardman Family* (1918); *From Father to Son* (1919); *The Noon Mark* (1920); *The House of Rimmon* (1922); and *Luther Nichols* (1923).

WAUGH, FRANK ALBERT (1869-). An American horticulturist, born at Sheboygan Falls, Wis., and educated at the Kansas Agricultural College and at Cornell University, and in Germany. For several years, he was engaged in newspaper work and after 1902 was professor of horticulture and landscape gardening at the Massachusetts Agricultural College. He wrote, *Landscape Gardening* (1898); *The Landscape Beautiful* (1910); *Beginner's Guide to Fruit Growing* (1912); *Rural Improvement* (1914); *Outdoor Theatres* (1917); *Downing's Landscape Gardening* (1921); *Textbook of Landscape Gardening* (1922); *Country Planning* (1924); *Formal Design in Landscape Architecture* (1927). He was also landscape engineer collaborating with the United States Forest Service.

WEATHER AND WEATHER FORECASTING. See METEOROLOGY.

WEBB, BEATRICE (1858-). An English economist and author (see Vol. XXIII), wife of Sidney Webb (see below). She was a member of several important committees during and after the World War, including the reconstruction committee in 1917-18, the war cabinet committee on women in industry in 1918-19, and the Lord Chancellor's advisory committee for women justices in 1919-20. From 1919 to 1927, she was a justice of the peace in London. Besides helping her husband in his writing, she wrote *Men's and Women's Wages: Should They Be Equal?* (1919), and *My Apprenticeship* (1926). She received honorary degrees from Manchester, Edinburgh, and Munich universities.

WEBB, RT. HON SIDNEY, FIRST BARON PASSFIELD (1859-). An English economist and Socialist (see Vol. XXIII). He served on many governmental committees, including the Coal Industry Commission (1919), entered Parliament as a Labor member (1922), and was president of the Board of Trade in the MacDonald government (1924). He was made a member of the Privy Council (1924), and received an honorary degree in Munich. In June, 1929, he was appointed Secretary of State for Dominion Affairs and the Colonies in the second Labor cabinet, and shortly afterward was created Baron Passfield. His later works include *Towards Social Democracy?* (1916); *The Works Manager To-day* (1917); and *The Story of the Durham Miners (1662-1921)* (1921). He edited *How to Pay for the War* (1916) and *Fabian Essays* (1920 edition). In collaboration with his wife, Beatrice Webb (see above), he published *A Constitution for the Social Commonwealth of Great Britain* (1920); *The Consumers Co-operative Movement* (1921); *English Prisons under Local Government* (1922); *The Decay of Capitalist Civilization* (1923); and *English Poor Law History* (part 1, 1927).

WEBB-POMERENE ACT. See TRUSTS.

WEEKS, JOHN WINGATE (1860-1928). An American banker and public official (see Vol. XXIII). He succeeded Winthrop Murray Crane as United States Senator from Massachusetts in 1913, but failed of reelection in 1919. During the World War, he assisted in investigations which resulted in the reorganization of the Ordnance and Quartermaster departments and also of the aircraft-production board. President Harding appointed him Secretary of War in 1921. He remained in President Coolidge's cabinet until October, 1925, when he resigned.

WEEVIL. See ENTOMOLOGY, ECONOMIC.

WEINGARTNER, vin'gart'nër, FELIX (1863-). An Austrian musical conductor (see Vol. XXIII). From 1919 to 1924, he was chief conductor and general director of the Volksoper at Vienna. In the fall of 1924, he entered on his duties as general director of the Deutsches Opernhaus in Charlottenburg (Berlin), but resigned the next year. In 1927 he settled in Basel as director of the Conservatory and conductor of the Allgemeine Musikgesellschaft. His recent works include two operas, *Meister Andra* and *Terokayn* (both produced in Vienna, 1920); an overture, *Aus Schwerer Zeit*; a second violin concerto; a 'cello concerto; two more symphonies, No. 4 (in F), No. 5 (in C minor).

WEINMAN, ADOLF ALEXANDER (1870-). An American sculptor (see Vol. XXIII). Among his later works are a bronze statue of Lincoln in the Capitol at Frankfort, Ky.; the pediment group of the Capitol at Madison, Wis., and several war memorials. His most important decorative works are the sculptures for the Pennsylvania Station in New York City, and those for the Municipal Building, New York City. He recently became well known as a medalist, having designed besides others the medals of the National Institute of Arts and Sciences, the American Numismatic Society (1920), and the dime and half-dollar of the national currency. In 1920 he was awarded the Saltus Medal of the American Numismatic Society.

WEISMANN, THEORIES OF. See HEREDITY.

WEIZMANN, CHAIM (1874-). A president of the World Zionist Organization, who was born in Motol, Province of Grodno, Russia, and educated in Pinsk and the universities of Berlin and Freiburg. He was a lecturer in chemistry in Geneva and later in biochemistry at the University of Manchester. From 1916 to 1919, he was director of the British Admiralty Laboratories. For many years a leader in the Zionist movement, he was instrumental in securing the proclamation of the Balfour Declaration in favor of a Jewish national home in Palestine. In August, 1929, he was reelected head of the World Zionist Organization and also president of the Jewish Agency Council, an organization of Zionists and non-Zionists interested in the establishment of a national home in Palestine.

WELCH, WILLIAM HENRY (1850-). An American pathologist (see Vol. XXIII). Professor Welch has collected and published many individual contributions with the title, *Papers and Addresses* (1920), and assumed the editorship of the *American Journal of Hygiene* (1921). In 1926 he was appointed professor of the history of medicine at Johns Hopkins. He has played a leading part in the organization of the new William H. Welch Medical Library of that university dedicated in October, 1929, which was named in his honor.

WELDING, ELECTRIC. See ELECTRIC WELDING.

WELFARE LEGISLATION. See CHILD LABOR.

WELLAND CANAL. See CANALS.

WELLER, STUART (1870-1927). An American geologist, born in Maine, N. Y., and educated at Cornell and Yale universities. In 1895 he became connected with the University of Chicago, where from 1915 until his death he was professor of paleontological geology. In addition to his professional work, he had wide experience on State geological surveys. He was also assistant geologist on the United States Geological Survey during 1901-06 and geologist, 1906-27. His specialty was Paleozoic paleontology, particularly in its relation to geologic problems. In addition to papers on geological subjects, he was the author of many reports on paleontology contributed to the publications of the National and State geological surveys with which he was connected.

WELLESLEY COLLEGE. A nonsectarian institution for the higher education of women at Wellesley, Mass., founded in 1875. The enrollment of students in 1914 was 1452, as compared with 1597 in 1928, the faculty numbered 140 in the earlier year, as compared with 164 in the latter; and the library increased from 80,000 to 125,000 volumes. In 1914 the main building of the college burned and thereafter two dormitories, Tower Court, given by Mrs. Ellen Stebbins James, and Claflin Hall, named in memory of Governor Claflin and Mrs. Claflin, Founder's Hall, a recitation building, the student-alumnae building, and two faculty residence buildings were erected. A \$2,000,000 endowment fund was raised to which the Rockefeller Foundation gave \$750,000, the General Education Board, \$200,000; two anonymous donors, \$100,000 each; and Andrew Carnegie, \$95,000. Severance Hall, a dormitory, and a botany building, including lecture rooms and laboratories, were opened in 1927. In that year, the curriculum was changed to reduce prescribed work by six hours weekly. Two dormitories, Stone and Olive Davis, were opened in 1928 and ground was broken in that year for a faculty apartment house. The total endowment in 1928 amounted to \$8,995,406. President, Miss Ellen Fitz Pendleton, Litt D., LL.D.

WELLESZ, EGON (1885-). An Austrian composer and musicologist, born at Vienna. He studied there under Arnold Schonberg (counterpoint) and Bruno Walter (composition), at the same time taking courses in musicology at the university under Professor Adler. In 1911 he became professor of the history of music at the Neues Konservatorium in Vienna. His literary essays, contributed to various important musical journals, deal mainly with Byzantine and Oriental music. As a composer, he is a follower of his teacher, Schönberg, and an extreme futurist. His compositions consist of the operas, *Prinzessin Gurnara* (Frankfort, 1921) *Alkestis* (Mannheim, 1924), *Scherz, List und Rache* (Stuttgart, 1928); the ballets, *Diana*, *Persisches*, *Achilles auf Skyros*, *Die Nachtlichen*; a symphonic poem, *Vorfrühling*; four string quartets; piano pieces; and many songs.

WELLS, FREDERIC LYMAN (1884-). An American psychiatrist and psychologist (see Vol. XXIII). He was attached to the McLean Hospital at Waverley, Mass., from 1918 to 1921, when he became head of the psychology depart-

ment at the Boston Psychopathic Hospital and instructor at the Harvard Medical School. His works after the World War include *Mental Adjustments* (1917); *Pleasure and Behavior* (1923); and *Mental Tests in Clinical Practice* (1927).

WELLS, H(ERBERT) G(EORGE) (1866-). An English novelist (see Vol. XXIII). He wrote several serious works which achieved wide circulation and added considerably to his already high reputation. These included: *The Research Magnificent* (1915); *Balby* (1915); *Mr. Britling Sees It Through* (1916); *The Elements of Reconstruction*, under the pseudonym "D. P." (1916); *War and the Future, God, the Invisible King, The Soul of a Bishop* (1917); *In the Fourth Year*, on the League of Nations; *Joan and Peter* (1918); *The Undying Fire* (1919); *The Outline of History*, an effort "to replace narrow nationalist history by a general review of the human record"; *Russia in the Shadows* (1920); *The Salvaging of Civilization* (1921); *The Secret Places of the Heart, Washington and the Hope of Peace; A Short History of the World* (1922); *Men like Gods* (1923); *The Dream* (1924); *The Story of a Great Schoolmaster* (F. W. Sanderson) (1924); *A Year of Prophecy* (1924); *Christina Alberta's Father* (1925); *Collected Works* (Atlantic Edition, 1925); *The World of William Chissold* (1926); *Mr. Belloc Objects to the Outline of History* (1926); *Democracy Under Revision* (Sorbonne Lecture, 1927); *The Open Conspiracy* (1928); *Mr. Blottsworthy on Rampole Island* (1928), and *The Way The World is Going* (1928). Consult *H. G. Wells*, by Ivor Brown (1923); *H. G. Wells, Educationalist*, by F. H. Doughty (1926), and *The Works of H. G. Wells, 1887-1925, a Bibliography, Dictionary, and Subject Index*, by Geoffrey H. Wells (1926).

WELLS COLLEGE. An institution for women, founded in 1868 at Aurora, N. Y. Due to a limitation on enrollment, the student body did not show any marked increase in numbers between 1913, when there were 194 students, and 1927-28, when there were 242. The faculty increased during that period from 33 to 42 members, and the volumes in the library from 25,160 to 60,000. Largely through two endowment drives, one for \$500,000 and the other for \$1,000,000, the funds of the college increased from \$361,800 to \$1,528,764, of which sum \$300,000 was contributed by the General Education Board. The income for 1927-28 amounted to \$78,840. During the period under review, a comprehensive examination system for matriculation was adopted, honors courses instituted, and a modification of the group system put into force. A wing was added to Glen Park, six cottages were purchased, the campus was increased from 76 to 350 acres, an athletic club house was received from R. L. Zabriskie, and a golf course of nine holes was added to the athletic equipment. President, Kerr Duncan Macmillan, B. A., B. D., S. T. D.

WENCKEBACH, KARL FRIEDRICH (1864-). An Austrian physician, known chiefly as a prominent member of the later school of cardiac specialists which came into being as the result of improved methods of diagnosis. He received his medical degree from the University of Vienna and was made a professor of internal medicine there in 1914. His first work on the heart was *Die Arrhythmie als Bestimmter Funktionsstörungen des Herzens* (1903), which appeared in English translation; and in 1914 he

added *Die Unregelmässige Herzthätigkeit*, brought out in a new edition of 2 vols. (1927), in collaboration with H. Winterburg.

WERFEL, FRANZ (1890-). An Austrian poet and dramatist, born at Prague, and educated there and in Leipzig. He is the author of *Der Weltfreund* (1911); *Wir Sind* (1913); *Einander* (1915); *Die Troerinnen* (1915); *Gedänge aus den Drei Reichen* (1917); *Der Gerichtstag* (1919); *Besuch aus dem Elysium* (1919); *Nicht der Mörder, der Ermordete ist Schuldig* (1920); and the dramas, *Spiegelmensch* (1920) and *Bocksgesang* (1922), which have had a sensational success. His later works are *Schweiger*, a tragedy (1923); *Beschwörungen*, poems (1923); *Verdi*, a novel (1924); *Juarez und Maximilian*, a drama (1924); *Paulus unter den Juden*, drama (1926); and the novels *Der Tod des Kleinburgers* (1920), *Geheimniss eines Menschen* (1927), and *Der Abituriententag, die Geschichte einer Jugendschuld* (1928, English trans., *Graduation Anniversary—the Story of a Youthful Crime*).

WERRENBATH, REINALD (1883-). An American concert baritone, born in Brooklyn, N. Y. He studied first with his father, then with C. Dufft, A. Mees, and Percy Rector Stephens, and made his début at the Worcester Festival of 1907. He then made several transcontinental tours and everywhere met with enormous success. In 1918-19 he was a member of the Metropolitan Opera Company. He is especially fine in oratorio. He has written some male choruses and edited a collection of modern Scandinavian songs.

WERTHEIMER, MAX (1880-). A German psychologist, born at Prague and educated in philosophy and psychology at the universities of Prague and Berlin. He performed experiments at the psychological institutes of Berlin and Würzburg. He was professor at the University of Berlin and one of the editors of the review, *Psychologische Forschung*. His published monographs deal largely with the perception of movement, which he investigated from a new point of view. He was one of the leaders of the school of Gestaltpsychologie, or psychology of forms. His works include: "Experimentelle Studien über das Sehen von Bewegung" (*Zeitschrift für Psychologie*, 1912); "Untersuchungen zur Lehre von der Gestalt" (*Psychologische Forschung*, 1922); a doctoral dissertation, *Experimentelle Untersuchungen zur Tatbestandsdiagnostik*; and *Gestalttheorie* (1925).

WESLEYAN METHODIST CONNECTION (OR CHURCH) OF AMERICA. A denomination formed in 1843 in Utica, N. Y., largely as an outgrowth of a controversy in the Methodist Episcopal Church over the right to discuss the slavery question freely. In doctrine, this non-episcopal connection resembles other Methodist bodies. At the quadrennial conference, in June, 1927, the use of tobacco in any form, its growth, sale, or manufacture, was made a test of full membership. There were, in 1928, 23 annual conferences, besides mission conferences in India and Africa. Membership in the church increased slightly from 20,939 in 1923 to 21,000 in 1928; and the number of ministers rose from 628 to 666; the Sunday-school enrollment dropped, however, from 35,254 to 30,124. The denomination publishes a weekly, *The Wesleyan Methodist*. It maintains, among other institutions, Central College, Central, S. C.; Houghton College, Houghton, N. Y., which received its permanent charter

in 1927; Marion College, Marion, Ind.; and Miltonvale College, Miltonvale, Kans. The headquarters of the church are at 330 East Onondaga Street, Syracuse, N. Y.

WESLEYAN UNIVERSITY. A nonsectarian institution for the higher education of men at Middletown, Conn., founded in 1831. In 1919 the trustees voted to limit the enrollment to approximately 500; in the fall of 1928, it was 620. During the period 1914-1928, the number of members in the faculty was increased from 42 to 71, and the library from 100,000 to 160,000 volumes. The Van Vleck observatory, largely the gift of Joseph Van Vleck in memory of his brother, Prof. John Monroe Van Vleck, was opened in 1916; in the same year, Mrs. Gardner Hall, Jr., gave \$150,000 to build a chemistry laboratory in memory of her husband. Ralph Ensign and his son, Joseph R. Ensign, gave \$30,000 to remodel the chapel; John Gribbel gave \$10,000 for an organ; and the class of 1863 gave a set of chimes. The university received in 1923 from Mrs. Dexter Smith of Springfield, Mass., \$175,000 toward a new library building. In the spring of 1922, William Arnold Shanklin, president of the university since 1909, completed a campaign for adding \$3,000,000 to the productive endowment, the total of which in 1928 was \$4,627,486.52. The Hall Laboratory of Chemistry was completed in 1926, and the Olin Library in 1927. The library, the Harrison Dormitory, and the Shanklin Laboratory of Biology were dedicated the following year. President, James Lukens McConaughy, Ph.D.

WEST, REBECCA (1892-). An English author, educated at George Watson's Ladies' College in Edinburgh. In 1911 she became a reviewer on the staff of the *Freewoman* and in 1912 began writing political articles for *The Clarion*. Later, she wrote many articles for magazines and newspapers in England and America. Her books include *Henry James* (1916); *The Return of the Soldier* (1918); *The Judge* (1922); *Strange Necessity* (1928); *Harriet Hume: A London Fantasy* (1929). She edited *Selected Poems of Carl Sandburg* (1926).

WEST, ROY OWEN (1868-). An American lawyer and public official. He was born at Georgetown, Ill., and graduated from De Pauw University, Greencastle, Ind. (1890). Admitted to the bar at Chicago, he became assistant county attorney of Cook County (1894) and city attorney of Chicago (1895-97). From 1898 to 1914, he served as member of the Cook County Board of Review. He was five times chosen chairman of the Illinois Republican State Central Committee, was a member of the Republican National Committee from 1912 to 1916, and served as secretary of that body in 1924. From 1917 to 1924, he was attorney of the South Park Commissioners. President Coolidge appointed him Secretary of the Interior in 1927 and he held that office until the close of the Coolidge Administration in March, 1929.

WESTCHESTER, Ill. See CITY AND REGIONAL PLANNING.

WESTERMANN, WILLIAM LINN (1873-). An American professor of history, born at Belleville, Ill., and educated at the University of Nebraska and in Berlin. He was instructor in Latin and Greek at the University of Missouri (1904-06), assistant professor of history at the University of Minnesota (1906-08), assistant professor of history at the University of Wisconsin (1908-20), and professor of ancient

history at Cornell University (1920-23). After 1923 he was professor of history at Columbia. In 1926-27 he was in charge of the American school of classical studies at the American Academy in Rome. At the Peace Conference in Paris, he acted as adviser on Turkish matters and as chief of the division of western Asia of the American delegation. Professor Westermann wrote *Story of the Ancient Nations* (1912) and contributed to American historical and philological journals. He was also the editor of *Westermann's Classical and Historical Map Series*.

WESTERMARCK, wés'tér-mark, EDWARD ALEXANDER (1862-). A Finnish anthropologist (see Vol. XXIII). His later works are *Marriage Ceremonies in Morocco* (1914); *The Belief in Spirits in Morocco* (1920); *Ritual and Belief in Morocco* (2 vols., 1926); *A Short History of Marriage* (1926); *The Goodness of Gods* (1926); and *Reminiscences*, in Swedish (1927).

WESTERN AUSTRALIA. A state of the Australian Commonwealth occupying the entire western third of the continent. Area, 975,920 square miles, population in 1911, 284,114; in 1928, 400,048. Full-blooded aborigines were estimated at 25,034 in 1928. Perth, the largest city, including its suburbs, had 191,791 inhabitants in 1928 (85,945 in 1911). Cultivation was spreading, there being 3,720,100 acres under crops in 1928 (1,537,922 acres in 1914). The wheat acreage continued to increase. Other agricultural products are oats, hay, barley, and fruits. The Government, after the World War, continued to apply itself to aiding settlers. Soldiers in particular were singled out for loans. Pastoral activities remain important. Sheep increased from 4,421,375 in 1913 to 8,447,480 in 1927. In 1927 the total wool clip was 62,702,073 pounds. Gold production showed decreases after 1914. The output of 1927 was valued at £1,735,000, as compared with £5,237,351 in 1914. There was a falling off in total mineral production total value in 1913, £6,036,265, in 1927, £2,202,437. For 1926-27 the value of production was agriculture, £13,034,025, pastoral, £7,190,770; dairy, poultry and bee farming, £1,800,024, forest and fisheries, £2,664,531, mining, £2,348,913, manufacturing, £6,618,473; total, £33,656,736. Imports and exports for 1914 were £8,960,397 and £8,406,182; for 1927-28, £18,287,876 and £18,240,775. Government accounts showed revenues and expenditures for 1913-14, £5,205,343 and £5,340,754; for 1927-28, £9,807,949 and £9,834,415. The public debt of £30,728,078 in 1914 mounted to £67,528,626 in 1928. Railroad construction continues. Railway lines in 1928 totaled 3977 miles (2967 miles in 1914). Tonnage entering Western Australian ports in 1927-28 totaled 1,289,066 tons.

WESTERN COLLEGE FOR WOMEN.

An institution at Oxford, Ohio, founded in 1855. The student enrollment increased from 260 in 1914 to 401 in 1928-29, the faculty was increased from 28 to 39 members, and the number of volumes in the library from 20,000 to 30,000. The productive endowment grew from \$250,000 to \$850,000, and two new dormitories, a heating plant, and a stone chapel, were built during the period 1914-1928. President, William W. Boyd, A.M., Ph.D.

WESTERN RESERVE UNIVERSITY.

A nonsectarian institution of higher education at Cleveland, Ohio, chartered in 1826. It included two colleges of liberal arts and sciences, Adelbert College for men and the college for women, with

815 undergraduates in 1914, and 1746 in 1928; and five professional schools with 544 students enrolled in 1914, and eight professional schools with 2111 students in 1928. The summer school in 1928 enrolled 1983 students, and 1838 teachers in service were taking courses in 1928. In that year, there was a registration of 3114 in Cleveland College, which was founded in 1925 as an independent organization affiliated with Western Reserve University and the Case School of Applied Science, giving evening courses in liberal arts, business administration, and engineering, the faculty for the most part being drawn from the teaching staffs of the affiliated institutions. During the period 1914-28, the faculty of the University was increased from 228 to 668 on the regular staff, and the libraries from 82,000 to 300,000 volumes. The endowment in 1914 was \$3,521,081.22, as compared with \$7,819,483.00 in 1928, and the income was \$269,006.10 in the earlier year, compared with \$1,739,906 in the later. Twelve acres adjoining the main campus were bought for the medical school in 1915, and in 1921 Samuel Mather gave \$500,000 to assure the removal of the school to the new site. In the following year, he pledged himself for the entire cost of the new buildings, which were completed in 1925. The new campus included the University Hospital, a group consisting of Lakeside Hospital, the Babies' and Children's Hospital, the Maternity Hospital, the school of medicine, and the school of nursing. Additional buildings constructed since 1914 include Flora Mather House, a dormitory for women, a gymnasium for men, and laboratories for the school of pharmacy and for the department of household administration of the college for women.

In 1927 facilities were acquired to meet the physical needs of the rapidly growing graduate school and this was followed in 1928 by the appointment of men to devote all their time to graduate instruction and research. In the same year, the university and the Board of Education of the City of Cleveland, by contract, undertook to operate the Cleveland School of Education with which the university forthwith merged its departments of education and nursing, kindergarten and primary training. The entrance requirements of the undergraduate colleges were broadened in 1919 by an increase in the number of electives which might be offered, and a diminution in the number of prescribed subjects. In 1922 the dental school increased its entrance requirements to include a year of college work, the school of pharmacy instituted a four-year course leading to the B.S. degree, and a department of nursing education was added to the college for women. In 1922 a course in business administration was added to the liberal arts curriculum, leading to the B.A. degree, and in 1923 the department of nursing education was organized as a separate school of the university with an initial endowment of \$500,000, the gift of Mrs. Chester C. Bolton. President, Robert E. Vinson, D.D., LL.D., LL.D.

WEST INDIES. See the articles on the island groups and the separate islands: **BAHAMAS**; **BARBADOS**; **CUBA**; **JAMAICA**; **HAITI**; **PORTO RICO**; **LEeward ISLANDS**; **WINDWARD ISLANDS**; **TRINIDAD**; **VIRGIN ISLANDS**; **GUADELOUPE**; **MARTINIQUE**.

WESTMINSTER COLLEGE. An institution for men and women under the auspices of the United Presbyterian Church, at New Wilmington, Pa., founded in 1852. The student

enrollment increased from 206 in 1914 to 528 in the autumn of 1928, and the faculty from 18 to 33 in 1927-28. The endowment rose from \$150,000, to \$750,000 in 1928, and the income for 1927-28 was \$180,000. A Bible chair fund of \$40,000 was raised during the period under review; a gymnasium was built in 1921 and Browne Hall a freshman residence building, in 1928, at a cost of \$185,000, as well as Old Main Memorial, at a cost of \$350,000. President, W. Charles Wallace, D.D.

WEST POINT. See **UNITED STATES MILITARY ACADEMY**.

WEST VIRGINIA. The fortieth State in size (24,170 square miles) and the twenty-seventh in population; capital, Charleston. The population increased from 1,221,119 in 1910 to 1,463,701 in 1920, a gain of 19.9 per cent, estimated population, 1928, 1,724,000. The white population increased from 1,156,817 (1910) to 1,377,235 (1920); Negro, from 64,173 to 86,345; native white, from 1,099,745 to 1,315,329; foreign-born white, from 57,072 to 61,906. Urban population rose from 228,242 to 369,007; rural, from 992,877 to 1,094,694. The growth of the principal cities was as follows: Wheeling, 1910, 41,641; 1920, 56,208, Huntington, 31,161 to 50,177, Charleston, 22,996 to 39,608.

Agriculture. Agriculture in West Virginia has undergone some decline in its general aspects. The number of farms decreased 9.7 per cent, or from 96,985 in 1910 to 87,289 in 1920, but rose to 90,380 in 1925; the total area in farms decreased 4.6 per cent, or from 10,026,442 acres in 1910 to 9,569,790 in 1920, and fell farther to 8,979,849 in 1925. The improved land in farms totaled 5,520,308 acres in 1920. The percentage of the total land area in farms decreased from 65.2 (1910) to 62.2 (1920) and 58.4 (1925). The total value of farm property rose 57.7 per cent, or from \$314,738,540 in 1910 to \$496,439,617 in 1925, but receded to \$411,159,152 in 1925; the average value per farm was \$3255 in 1910, \$5687 in 1920, and \$4549 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 74,943 were operated by owners; 662, by managers; and 14,775, by tenants. The corresponding figures for 1910 were 75,978, 872, and 19,835. White farmers in 1920 numbered 86,785 and colored farmers, 504. In 1925 white farmers numbered 89,666, colored, 714. There were 9104 farms reported as under mortgage in 1925; 10,274 in 1920. Cattle numbered 587,462 in 1920; 567,769 in 1925, dairy cows numbered 255,021, in 1920, 137,323 in 1925. Sheep numbered 509,831 in 1920; 441,401 in 1925; swine, 305,211 in 1920; 177,012 in 1925. The estimated production of the principal farm products in 1928 was as follows: Corn, 16,524,000 bushels; wheat, 1,586,000, oats, 5,712,000, potatoes, 7,500,000; tobacco, 5,100,000 pounds; and hay, 1,198,000 tons. Comparative figures of 1913 are corn, 22,692,000 bushels; wheat, 3,055,000; oats, 2,760,000, potatoes, 3,984,000, hay, 925,000 tons, and tobacco, 10,200,000 pounds.

Mining. West Virginia is fifth among the States in the value of its mineral products first in the production of natural gas as to value, and second in that of coal. Coal is by far its most valuable mineral, although the outputs of natural gas, petroleum, and clay products are also of great importance. The progress of coal mining during the period starting with 1914 is

indicated by the following production figures: 1914, 71,707,626 net tons, valued at \$71,391,408; 1915, 77,184,069, \$7,561,349; 1916, 86,460,127, \$102,366,092; 1917, 86,441,667, \$200,659,368; 1918, 89,935,839, \$230,508,846; 1920, 89,970,707, \$390,046,000; 1921, 72,786,996, \$206,661,500; 1926, 143,509,340, \$264,736,000; 1927, 145,122,447, \$249,730,000; and 1928, 132,952,159, \$211,480,000. The greatly increased value of the coal produced from 1917 to 1920 was due chiefly to conditions in the coal-mining field which resulted in a greater demand for coal, and partly to the inflation of the currency which reduced the buying power of money and thereby increased prices. The production of natural gas, in 1914 was 236,489,175 M cubic feet; 1918, 265,160,917; 1920, 239,718,800; 1921, 174,920,800; 1926, 180,223,000. In later years, the production of natural gas gasoline was large and valuable. In 1920, 58,941,488 gallons; in 1926, 63,807,000. The production of petroleum was as follows. 1914, 9,680,033 barrels; 1916, 8,731,184; 1918, 7,866,628; 1920, 8,249,000; 1922, 7,021,000; 1926, 5,946,000. Clay products increased from a value of \$5,761,411 in 1914 to \$7,634,321 in 1916; \$10,988,677 in 1918; and \$16,121,172 in 1926. In addition to the minerals mentioned above, the State also produces salt, sand and gravel, and stone. The total value of the mineral production in 1926 was \$395,941,940, compared with \$547,872,037 in 1920; \$298,168,194 in 1919; \$327,962,260 in 1918, and \$133,633,229 in 1914.

Manufactures. West Virginia has many important industries. These had a steady growth from 1909. There were in the State in 1920, 10 cities with more than 10,000 inhabitants, which contained 17.9 per cent of the total population and reported, in 1919, 41.2 per cent of the value of the State's manufactured products. There were in the State in 1909, 2586 manufacturing establishments; in 1919, 2785; in 1925, 1395; and in 1927, 1313. Persons engaged in manufacturing numbered 71,463, 93,688, 80,700, and 77,630, respectively. The capital invested amounted to \$150,922,586 in 1909, and \$339,189,678 in 1919. The value of products in 1909 amounted to \$161,949,526; in 1919, to 471,970,877; in 1925, to \$470,821,582, and in 1927, to \$451,555,334. The increase in value of products about 1919 was in great measure due to the change in industrial conditions brought about by the War and cannot be taken to indicate a proportionate increase in the manufactures; but the increase in the number of persons employed clearly indicated a growth in the State's manufacturing activities. The principal industry in point of value of its product is the iron and steel and rolling mill, with an output valued in 1909 at \$22,435,000; in 1919, \$85,036,000; and in 1925, at \$92,565,227. Lumber and timber products rank second in point of value, amounting to \$28,758,000 in 1909; \$46,314,000 in 1919; and \$26,787,495 in 1925. The manufacture of glass, third in value, had a product valued at \$7,779,000 in 1909; \$14,631,000 in 1914, and \$42,730,000 in 1919. Wheeling and Huntington were the leading manufacturing centres. In 1909 there were in Wheeling 176 manufacturing establishments, with a product valued at \$27,077,000; in 1914, 201 with \$27,879,000; and in 1919, 243 with \$72,640,000. Parkersburg had, in 1909, 75 with \$5,498,000; in 1914, 83 with \$7,143,000; and in 1919, 73 with \$24,056,000.

Education. Among the notable features in the more recent educational development of West

Virginia was the addition to the Department of Education of a supervisor of teacher training, a supervisor of health and sanitation, and a supervisor of physical education. A high-school assistant supervisor and two rural professors also were added as part of the organization. The Legislature of 1919 passed three important measures: the teacher's-salary law; a measure providing for the standardization of rural schools; and a law increasing the general school fund by \$1,000,000 for each of the next two years. A high-school movement in the State made progress, with the result that the number of classified high schools rose from 171 in 1919-20 to 205 in 1922 and that in 1925-26, 227 school houses were employed for secondary instruction exclusively. The Negro schools of the State made noteworthy improvement. There were in 1922 16 recognized Negro high schools, 6 of which were high schools of the first class. The enrollment in colored high schools increased from 484 in 1919 to 2324 in 1925-26. The development of vocational education kept pace with that of other branches. There was a very considerable enrollment in home economics, trades, and industries, and mining and vocational agriculture. The Legislature of 1921 took an advanced step by passing what is known as the compulsory part-time law, requiring all cities with a population of 10,000 or more, and other industrial centres where as many as 50 young people are working under labor permits, to establish part-time schools or classes. In cooperation with the Federal government, the State Board of Education organized a civilian rehabilitation service, which was thought very effective in its operation. The total enrollment in the high and elementary schools in 1912 was 435,611; in 1925-26 it was 382,830. In the high schools, in the latter year, there were enrolled 36,114. The total colored enrollment in 1925-26 in kindergarten, elementary, and secondary grades was 22,225. The expenditure for public day schools in 1925-26 was: current, \$22,070,820; outlays for new buildings, sites, and equipment, \$4,164,659. The percentage of illiteracy in the State decreased from 10.2 in 1910 to 8.2 in 1920: in the native white population, from 8.4 to 6.1; in the colored, from 24.2 to 18.9. In the foreign-born white population it increased from 23.9 to 24.5.

Finance. State expenditure in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, was for maintenance and operation of State departments, \$12,952,347 (of which \$2,228,610 was for local education), for interest on debt, \$2,510,508; for permanent improvements, \$11,964,378; total, \$27,427,233 (of which \$12,452,106 was for highways, \$2,319,868 being for maintenance and \$10,132,238 for construction). Revenues were \$20,758,241; of these, property and special taxes formed 23.4 per cent; departmental earnings, 8 per cent; receipts from licenses, 57.7 per cent. Assessed property valuation was \$2,130,255,951; State taxation thereon, \$2,982,358. Net State debt on June 30, 1927, was \$51,536,254.

Political and Other Events. On July 1, 1914, a drastic prohibition law went into effect, as a result of a State-wide prohibition amendment passed in 1912. In 1915 a report was made on the long-standing controversy between Virginia and West Virginia as to the liability of the latter in the State debt of Virginia before the separation of the two States. Charles D. Littlefield, special arbitrator, decided that West

Virginia should pay part of the debt. The Supreme Court, on June 14, 1915, decreed that West Virginia should pay \$12,393,929. In 1916 the Democrats elected as governor John J. Cornwell. The Republicans elected Howard Sutherland United States Senator. For President, Hughes received 141,432 votes; Wilson, 139,013. In 1918 Davis Elkins, Republican, was elected to the United States Senate. In 1920 E. F. Morgan, Republican, was elected governor. For President, Harding received 282,007 votes; Cox, 220,789. In May, 1921, as a result of disorders arising from strikes in the coal mines, Mingo County was placed under martial law by Governor Morgan. The strike was the result of an attempt to unionize the mines in this part of the State. The trouble continued until September, when the armed miners surrendered to Federal troops, who took charge of the situation. In 1922 M. M. Neely, Democrat, was elected United States Senator. For President, Coolidge received, in 1924, 288,635 votes; Davis, 257,232; La Follette, 36,723. Howard M. Gore, Republican, was elected governor in 1925; in 1928 William G. Conley, also Republican. For President, the vote in 1928 was: Hoover, 375,551; Smith, 263,784. Henry D. Hatfield (Rep.) was elected Senator.

Legislation. In 1915 the Legislature enacted an amendment to the prohibition law. The Legislature of 1917 amended the election laws and passed a measure providing for the protection of judges against personal violence. This Legislature refused to make provision for the payment of the State's portion of the Civil War debt, but the session of 1919 adopted a resolution for settling the debt. The Legislature of 1919 provided for a constitutional amendment dividing the legislative session into two parts, the first, lasting 15 days, to be devoted to the introduction of bills, the second, after a recess, to be given to their consideration and final action. This Legislature authorized the creation of a State police force and enacted measures forbidding child labor. It also compelled school attendance of children under 14 years of age. A special session of the Legislature was held in 1920 to ratify the woman-suffrage amendment. By virtue of a constitutional amendment ratified by the people in 1920, the Legislature of 1921 authorized the governor to issue \$50,000,000 in bonds for permanent road improvement. A further amendment, for the issue of \$35,000,000 more, was proposed in 1927. A mine-regulatory act, creating the Department of Mines, was passed in 1925.

WEST VIRGINIA UNIVERSITY. A co-educational State institution of higher education at Morgantown, W. Va., founded in 1867. The student enrollment increased during the period 1914-28, with 775 registered in the earlier year and 2650 in the latter. Faculty membership increased from 80 to more than 300, and the number of volumes in the library from 47,000 to 92,000. Woman's Hall, Oglebay Hall, the medical building, and the law school building were constructed during the period. A gift of valuable coal lands was received from Dr. I. C. White, and a farm and live stock from the estate of Lawrence A. Reymann. In 1924 a course leading to the degree of B.S. in public health was established. A chemistry building, a woman's gymnasium, and a field house for men were completed in 1927-28. President, John Roscor Turner, Ph.D.

WHARTON, EDITH (1862-). An American novelist (see Vol. XXIII). Her later books are *Summer* (1917); *The Marne* (1918); *French*

Ways and Their Meaning (1919); *The Age of Innocence* (1920); *Glances of the Moon* (1922); *A Son at the Front* (1923); *False Dawn* (1924); *Mother Recompense* (1925); *The Writing of Fiction* (1925); *Here and Beyond* (1926); *Twilight Sleep* (1927); *The Children* (1928); *Hudson River Bracketed* (1929).

WHEAT. For the countries reporting their yields every year, the production of wheat increased from an annual average of 1,500,000,000 bushels for the 3 years 1891-93 to 3,632,720,000 for the 3 years 1926-28. In the United States, production rose rapidly during the World War. For the years 1914-24, the average annual production was 837,464,000 bushels, as compared with 681,368,000 for 1904-13. The largest crop ever grown, 1,025,801,000 bushels, was produced in 1915 and the highest acreage, 73,099,421, an increase of 20 per cent over any previous year, was harvested in 1919. The general effect of the War was to increase production and to limit consumption. The principal governments of the world passed laws requiring a maximum percentage of flour in grinding, prescribing minimum percentages of wheat-flour substitutes in baking, placing wheat-flour consumption on a rationing basis, regulating the trade in wheat, and fixing the price. In the United States, wheat prices, beginning to rise with the outbreak of the War, had reached \$1.40 per bushel by May, 1915. In 1917 the United States Food Administration fixed the price of No 1 Northern Spring Wheat at \$2.20 per bushel at Chicago with differentials for grades and other terminal markets. The price had reached \$2.58 per bushel on June 1, 1920, a month before price fixation by the Government terminated, and a downward movement began which, by December, 1921, had reduced the price to \$0.90 per bushel. In purchasing power, the price of \$0.94 on Dec. 1, 1921, was below that of the low price of \$0.49 on Dec. 1, 1894.

Since 1920 the quantity of protein in wheat has become an increasingly important price factor and by 1928 a high protein content in the bread wheats quite generally commanded a premium. At present, testing wheat for protein content by either State or commercial laboratories is an accepted practice at the principal terminal markets of the Central West, which receive the winter and spring hard wheats. Plans are under advisement by which the grower may be assured of the full market value of his product to which he may be entitled on the basis of protein content.

The combined harvester and thresher, or combine, confined to the Pacific States for 50 years, made its appearance in the Great Plains region about 1917, and since then its use has spread to all the important grain-producing sections of the United States and Canada. These machines are operated with horses or tractors and vary in size and type to meet requirements. A machine cutting 16 feet wide harvests about 30 acres per eight-hour day.

Standards and Grading. The United States Grain Standards Act of Aug. 11, 1916, authorized the Secretary of Agriculture to investigate the handling and grading of grain, establish official standards, and license grain inspectors. Under this law, all wheat in interstate and foreign commerce is graded by the licensed inspectors according to the official wheat standards of the United States, as revised and effective Sept. 15, 1927. These standards, based on color and texture of kernels, as indicating quality, comprise the following classes and subclasses: Class

1, hard red spring wheat, with subclasses (a) dark northern spring, (b) northern spring, and (c) red spring; Class II, durum wheat, and subclasses (a) amber durum, (b) durum, and (c) red durum, Class III, hard red winter wheat, including subclasses (a) dark hard winter, (b) hard winter, and (c) yellow hard winter; Class IV, soft red winter wheat, including subclasses (a) red winter, and (b) Western red, and Class V, white wheat, with subclasses (a) hard white, (b) soft white, and (c) Western white. Each subclass is divided into five grades, determined by test weight per bushel, moisture content, percentage of damaged kernels, purity, cleanness, and condition. Wheat failing to meet the specifications for any one of these grades is designated "sample grade." In addition, grades for mixed wheat, mixed durum, treated, gurlicky, smutty, and weevily, wheat are included. A campaign to eradicate the common barberry, on which the spring stage of black stem rust of wheat occurs, has been in progress since 1918. Consult U. S. Department of Agriculture *Year Book* for 1921 and 1927. See AGRICULTURE.

WHEATON COLLEGE. An institution for the higher education of women at Norton, Mass., founded under the direction of Mary Lyon as a seminary in 1834, and chartered as a college in 1912. Admission is by college-entrance board examinations. There was a student enrollment of 497 in 1927-28, and the faculty consisted of 10 men and 40 women in the autumn of 1928. The productive funds of the college increased from approximately \$1,000,000 in 1924 to \$1,025,000 in 1928, and the value of buildings and equipment from \$1,000,000 to \$1,606,246. The campus covers more than 100 acres, including large stretches of pine woods, and the plant consist of 33 buildings, including dormitories, chapel, science building, gymnasium, observatory, power house, and library (with 25,000 volumes). President, J (ohn) Edgar Park, A.B., D.D., LL.D.

WHEAT RUST. See PLANTS, DISEASES OF.

WHEELER, BURTON KENDALL (1882-). A United States Senator, born at Hudson, Mass., and educated at the University of Michigan. He began his career as a stenographer in Boston, but later became a lawyer in Butte, Mont., and attracted much attention by his success in winning damage suits for the miners against the big copper companies. The liberal political element in Butte sent him to the State Legislature in 1911, and he was Federal district attorney in Montana during 1913-19. In 1922 he was elected to the United States Senate by a large majority. While in charge of the investigation of former Attorney General Daugherty, he was indicted in Montana on a charge of accepting a fee illegally, but was exonerated by a special Senate committee. In 1924 he was nominated for the office of Vice President of the United States on La Follette's Progressive ticket. He was reelected to the Senate in 1928.

WHEELER, WILLIAM MORTON (1865-). An American zoologist (see VOL. XXIII.) He has continued as professor of entomology and dean of the Bussey Institute for Research in Applied Biology at Harvard. He wrote *Social Life among the Insects* (1923).

WHIPPLE, GEORGE HOYT (1878-) An American pathologist. He was born at Ashland, N. H., graduated from Yale, and received his M.D. degree from The Johns Hopkins Medical School (1905). Until 1908 he conducted pathological

researches in Ancon Hospital, Panama, and from 1909 to 1914, he was pathologist at The Johns Hopkins University and Hospital. He then went to the University of California as director of medical research (1914-21) and dean of the medical school (1920-21). Since 1921 he has been dean and professor of pathology at the University of Rochester School of Medicine and Dentistry. In 1927 he became a trustee of the Rockefeller Foundation. He was elected a member of the National Academy of Science in 1929.

WHIPPLE, GUY MONTROSE (1876-). An American psychologist, born at Danvers, Mass., and educated at Brown and Cornell universities. He began teaching in 1902 at Cornell and went to the University of Illinois in 1914. The Carnegie Institute of Technology employed him from 1917 to 1919 as acting director of its bureau of salesmanship and as professor of applied psychology. He was professor of experimental education in the University of Michigan from 1919 to 1925. During the World War, he was a member of the committee on mental examination of army recruits. His writings include *Questions in School Hygiene* (1909); *Manual of Mental and Physical Tests* (2d ed, 1914); *How to Study Effectively* (1916); *Classes for Gifted Children* (1919); *Problems in Educational Psychology* (1922); *Problems in Mental Testing* (with Helen D. Whipple, 1925).

WHITAKER, MILTON C. (1870-). An American chemist, born in Frazzysburg, Ohio, and educated at the University of Colorado. In 1903 he became chemist and general superintendent of the Welsbach Company, but resigned in 1911 to accept the professorship of chemical engineering at Columbia University. This chair he held until 1917, when he was made vice president of the United States Industrial Alcohol Company and president of the United States Industrial Chemical Company. He resigned from both positions in 1927. In 1923 he received the Perkin Medal of the American section of the Society of Chemical Industry for his original work on the chemistry and production of alcohol and its derivatives. In 1911-16 he was editor of the *Journal of Industrial and Engineering Chemistry*.

WHITE, FRANK (1856-). An American public official. He was born at Stillman Valley, Ill., and graduated from the University of Illinois (1880). Having settled in North Dakota, he was elected to the House of Representatives of that State (1891-93) and to the State Senate (1893-99). He was major of the First North Dakota Volunteer Infantry in the Spanish-American War and served in the Philippines. From 1901 to 1905, he was Governor of North Dakota. In the World War, he was a colonel of infantry (41st Division), serving fourteen months in France. During the years 1921-28, he was Treasurer of the United States and since 1928 has been president of the Southern Mortgage Guaranty Corporation of Chattanooga, Tenn.

WHITE, JAMES (1863-1928). A Canadian geographer (see VOL. XXIII.). He was made chairman of the advisory board on wild life protection in 1917 and in the same year won the Alexandre Roquette Prize. In 1921 he was employed in the Labrador boundary case and in 1922 became technical adviser to the Minister of Justice. He was chairman of the geographic board from 1925 until his death.

WHITE, JOHN ELLINGTON (1868-). An American Baptist clergyman and college president, born at Clayton, N. C., and educated at the

Wake Forest College. Ordained to the Baptist ministry in 1892, he served as pastor in churches in North Carolina and South Carolina. From 1916 to 1927, he was president of Anderson College. He was the founder of a system of Baptist schools for the mountaineers and president of the Clifton Conference for Negro Schools. From 1914 to 1916, he was preacher and lecturer at the University of Chicago. Since 1927 he has been pastor of the First Baptist Church of Savannah, Ga. He is the author of *The Silent Southerners* (1906); *The New Task and Opportunity of the South* (1908); *Southern Highlanders* (1913); and *A Yielded Pacifist* (1917).

WHITE, WILLIAM ALANSON (1868-). An American neurologist and alienist (see Vol. XXIII). Since 1914 Dr. White has produced several major works, beginning with the treatise on neurology written in collaboration with Jelliffe, *Diseases of the Nervous System* (1915). The ninth edition of his *Outlines of Psychiatry* appeared in 1923. The following monographs also came from his pen: *Mechanisms of Character Formation* (1916); *The Principles of Mental Hygiene* (1917); *The Mental Hygiene of Childhood* (1919); *Thoughts of a Psychologist on the War and After* (1919); *Foundations of Psychiatry* (1921); *Insanity and the Criminal Law* (1923); *Essays in Psychopathology* (1925); *The Meaning of Disease* (1926); and *The Major Psychoses* (1928).

WHITE, WILLIAM ALLEN (1868-). An American journalist and author (see Vol. XXIII). During the World War, the American Red Cross sent him to Russia as an observer, and he was appointed a delegate to the Russian Conference at Prinkipo in 1919. His later publications include *God's Puppets* (1916); *In the Heart of a Fool* (1918); *The Martial Adventures of Henry and Me* (1918); *Life of Woodrow Wilson* (1924); *Life of Calvin Coolidge* (1925); *Masks in a Pageant* (1928).

WHITEHEAD, ALFRED NORTH (1861-). A British mathematician and philosopher (see Vol. XXIII). He was professor of applied mathematics at the Imperial College of Science and Technology, South Kensington (1914-24), president of the Mathematical Association (1915-16), and of Section A of the British Association (1916), and professor of philosophy at Harvard University (since 1924). He received the first James Scott Prize of the Edinburgh Royal Society (1922), and the Sylvester Medal of the Royal Society (1925). After terminating his joint inquiry with Bertrand Russell into the foundations of mathematics and logic, published as *Principia Mathematica* (3 vols., 1910-13), he devoted himself to the elaboration of a philosophy of physical science. This philosophy, although conducted on realistic presuppositions, was free from the deterministic dogmatism characterizing so many realistic philosophies. In *The Principle of Relativity* (1922), he presented what he regarded as an alternative rendering of the theory of relativity. He retained the metrical formula of Einstein's special theory but discarded the general theory and so reframed the equations as to maintain the traditional distinction between physics and geometry. His other works since 1914 include *Principles of Natural Knowledge* (1919); and *The Concept of Nature*, Tarnier Lectures delivered in Trinity College, Cambridge, 1919 (1920); *Science and the Modern World*, Lowell Lectures (1925); *Religion in the Making*, Lowell Lectures (1926); *Symbolism; its Mean-*

ing and Effect (1927); and *The Aims of Education and other essays* (1929).

WHITEHEAD, JOHN BOSWELL (1872-). An American electrical engineer, born in Norfolk, Va., and educated at The Johns Hopkins University. In 1897 he returned there as instructor in applied electricity, and in 1910 he was advanced to a professorship. Since 1919 he also has been dean of the faculty of engineering there. His original researches have had to do with such subjects as magnetic effect of electric displacement, single-phase railway system, and submarine detection. Besides many papers on engineering and physical topics, he wrote *Electric Operation of Steam Railways* (1909) and *Dielectric Theory and Insulation* (1927).

WHITE SLAVERY. See LEAGUE OF NATIONS.

WHITHORNE, EMERSON (1884-). An American composer, born at Cleveland, Ohio. He studied there with J. Hartman (piano and harmony) and J. Rogers (composition). From 1904 to 1906, he continued his studies in Vienna under Leschetizky (piano) and R. Fuchs (composition) and spent the following year in Berlin with Arthur Schnabel (piano). In 1907-14 he lived in London as a teacher and writer on musical subjects and served as critic on the *Pall Mall Gazette* (1913-14). In 1915 he settled in St. Louis as editor for the Art Publication Society. In 1907 he married the pianist Ethel Leginska, but separated from her in 1909. His works include the symphonic poems, *Ranga*, *The City of Ys*, *In the Court of the Pomegranates*, and *Fata Morgana*, the orchestral suites, *Japanese*, *Adventures of a Samurai*, and *New York Days and Nights* (also arranged for piano); several minor works for orchestra; three string quartets, a song cycle for vocal quartet, *Songs of Sappho*; piano pieces; and songs. He is the author of *Instruments of the Modern Symphony Orchestra* (1921).

WHITING, WILLIAM F (1864-). An American paper manufacturer and Secretary of Commerce. He was born at Holyoke, Mass., and after being graduated at Amherst College (1886), developed and expanded the paper-making industry inherited from his father. Never seeking public office, he was keenly interested in politics, and was a delegate to the Republican National Convention in 1920, 1924, and 1928. In August, 1928, President Coolidge, a personal friend of many years' standing, appointed him Secretary of Commerce to succeed Herbert Hoover, who had been nominated for President. Mr. Whiting served in this office until the close of the Coolidge administration in March, 1929.

WHITLOCK, BRAND (1869-). An American author and diplomat (see Vol. XXIII). As United States Minister to Belgium during the World War, he opposed German aggression with great boldness and considerable success and on many occasions saved the Belgians from the effects of drastic edicts. He was Ambassador to Belgium from 1919 to 1920, and for his services during the War received numerous European decorations. In 1918 he wrote *Memories of Belgium Under the German Occupation*. He published the following novels: *J. Hardin and Son* (1923); *Uprooted* (1926); *Transplanted* (1927); and *Big Matt* (1928), and a biography, *La Fayette* (1929).

WHITMAN COLLEGE. A coeducational institution of higher learning at Walla Walla, Wash., founded in 1859. Student enrollment in

the fall of 1928 was 546. In the same year, productive funds amounted to \$1,182,851.04 and annual income to \$222,624. Gifts included \$250,000 from the General Education Board and \$75,000 from the Weyerhaeuser family. New buildings included Lyman House, a men's dormitory costing \$100,000, Prentiss Hall, a dormitory for women, costing \$200,000, and a heating plant costing \$50,000. Two financial campaigns in the interest of the college resulted in subscriptions of approximately \$1,500,000. President, Stephen Beasley Linnard Penrose, D.D., LL.D.

WHITNEY, GERTRUDE VANDERBILT (Mrs. Harry Payne Whitney) (1877-). An American sculptor. During the World War, she founded a hospital in France and labored unremittingly among the soldiers. Her war sculptures are unique in their quality of distinctly feminine sympathy and tenderness for the young soldiers. Among the best of them are "Found," "Engineers," and "Not Yet Discharged." These are all figures and groups of American soldiers.

WICA, L. See **WILLIAM (WILHELM), PRINCE OF SWEDEN.**

WICKERSHAM, GEORGE WOODWARD (1858-). An American lawyer and public official (see Vol. XXIII). In 1915 he was delegate-at-large and chairman of the judiciary committee of the New York Constitutional Convention. From 1914 to 1917, he was president of the Association of the Bar of the City of New York. He was a member and later vice chairman of the District Board of the City of New York under the United States Selective Service Law in 1917-18. In 1920 he was president of the American Prison Association and chairman of the executive committee of the New York Prison Association. He has been president of the American Law Institute since 1923, and since 1924, a member of the commission on progressive codification of international law, appointed by the Council of the League of Nations. In 1925-26 he served on the Commission for the Reorganization of the New York State Government. In 1929 President Hoover appointed him chairman of the National Law Enforcement Commission. He received the honorary LL.D. degree from Harvard (1921), Hobart (1922), and the University of Michigan (1927). He wrote *Spring in Morocco* (1923).

WIDAL, vè-dál (GEORGES) FERNAND ISIDORE (1862-1929). A French bacteriologist and clinician (see Vol. XXIII). In the decade since 1914, he added to the laurels which he had won in serodiagnosis and in the salt-poor diet for renal dropsy, by innovations in the prognosis of chronic kidney disease by determining the amount of residual blood nitrogen. In collaboration with Roger and Teissier, he produced *Nouveau Traité de Médecine* (1920) and, with Teissier and others, *Rhumatismes* (1924).

WIDDEMER, MARGARET (Mrs. ROBERT HAVEN SCHAUFFLER) (?-). An American author, born at Doylestown, Pa., and graduated from the Drexel Institute Library School in 1909. She wrote poems when a child. A child-labor poem entitled *The Factories*, her first published work, attracted wide attention. Among her other writings are *The Rose-Garden Husband* (1915); *Winona of the Camp Fire* (1915); *Why Not?* (1915); *The Washing-Ring Man* (1917); *Winona's War Farm* (1918); *The Old Road to Paradise* (1918), which gained her a share of the Pulitzer Prize for the best book of poems, in the year 1919; *Graven Image* (1923); *Gallant Lady* (1926); *Collected Poems* (1928).

WIEDENFELD, KURT (1871-). A German economist and public official, who was born in Berlin and educated at the universities of Lausanne, Munich, Leipzig, and Berlin. He became a lecturer on economics at the University of Berlin in 1903, later served as director of the German Foreign Trade Department, and in 1918 was for a short time Minister for Foreign Affairs. During 1921-22 he was German Chargé d'Affaires in Russia, after which he became professor of economics at the University of Cologne and (in 1923) at the University of Leipzig. He wrote *Die Nordwesteuropäischen Welthäfen* (1923); *Das Persönliche im modernen Unternehmertum* (1911, 1920); *Lenin und sein Werk* (1923), translated into English as *The Remaking of Russia; Gewerbepolitik* (1927).

WIELAND, vè-lant, HEINRICH (1877-). A German chemist, who was born at Pforzheim and educated at the universities of Munich, Berlin, and Stuttgart. He became professor of chemistry at the technical high school of Munich in 1917 and at the university there in 1925. In 1927 he received the Nobel Prize for chemistry for his discovery of the structure of the substance which gives bile its color and its relation with chlorophyll and hemoglobin. In addition to his work in chemistry, he holds doctorates in medicine, engineering, and philosophy. He is a member of the academies of Munich, Göttingen, and Heidelberg and chairman of the German Chemical Society. His publications include numerous works on chemistry and biochemistry. He also edited *Liebig's Annals of Chemistry*.

WIENER, FRANZ VON. See **CROISSET, FRANCIS DE**.

WIESBADEN AGREEMENT. See **GERMANY**, under *History*; *REPARATIONS*.

WIGGIN, KATE DOUGLAS (Mrs. GEORGE C. RIGGS) (1859-1923). An American author (see Vol. XXIII) who died in London. Among her later stories were *Bluebeard*, a musical fantasy (1914), *Penelope's Postscripts* (1916); *Ladies in Waiting* (1918), and *Homespun Tales* (1920). Her reminiscences were published posthumously as *My Garden of Memories* (1924).

WIGMORE, JOHN HENRY (1863-). An American professor of law (see Vol. XXIII). He was professor of law at Northwestern University, Chicago, Ill., from 1893 to 1928, serving as dean of the law faculty during the last 27 years of that period. He retired with the title of dean emeritus. His later works included *Problems of Law, Its Past, Present, and Future* (1920) and *A Panorama of the World's Legal Systems* (1928). He was editor and co-editor of various legal treatises. In the World War, he served as colonel and was awarded the Distinguished Service Medal.

WILAMOWITZ-MÖLLENDORF, vè-la-mò-vits-mèl'en-dörf, ULRICH VON (1848-). A German philologist (see Vol. XXIII). He translated and edited many Greek classics. His later works are *Antike Metrik* (1922); *Pindar* (1923); *Reden und Vorträge* (1925-26); *Die Heimkehr des Odysseus, neue homerische Untersuchungen* (1927); *Erinnerungen, 1848-1914* (1928).

WILBUR, CURTIS DWIGHT (1867-). An American lawyer and public official, born at Boonesboro, Iowa. He was graduated at the United States Naval Academy in 1888, resigned from the Navy in the same year, and in 1890 began the practice of law in Los Angeles. He was judge of the Superior Court of Los Angeles County from 1903 to 1918 and became justice of

the Supreme Court of California in 1919. He organized the Juvenile Court of Los Angeles and drew up several of the juvenile-court laws of California. On the resignation of Edwin Denby, Judge Wilbur was appointed Secretary of the Navy by President Coolidge and served from March, 1924, to 1929.

WILBUR, RAY LYMAN (1875-). An American physician, educator, and former president of Stanford University (see VOL. XXIII). In 1917 he was chief of the conservation division of the United States Food Administration and a member of the California State Council of Defense. In 1918 he was a regional director of the Students' Army Training Corps and in 1919 president of the California State Conference of Social Agencies. He was president of various medical societies, chairman of the medical council of the U S Veterans' Bureau (since 1924), chairman of the Institute of Pacific Relations at Honolulu (since 1925), and a member of the American delegation to the sixth Pan-American Conference at Havana in 1928. In March, 1929, he was appointed Secretary of the Interior in President Hoover's cabinet.

WILCZYNSKI, ERNEST JULIUS (1876-). An American mathematician, born in Hamburg, Germany, and educated at the University of Berlin. Coming to the United States in 1897, he taught mathematics at the University of California (1898-1907), and at the University of Illinois (1907-10), then transferring to the University of Chicago as associate professor (1910-14), and professor (since 1914). He is a member of the National Academy of Sciences. He wrote *Projective Differential Geometry of Curves and Ruled Surfaces* (1906), *The New Haven Colloquium*, with E. H. Moore and M. Mason (1910); *Plane Trigonometry and Applications* (1913); and *College Algebra with Applications* (1916).

WILDER, HARRIS HAWTHORNE (1864-1928). An American zoologist, born at Bangor, Me., and educated at Amherst College and at Freiburg. He was professor of zoology at Smith College (1892-1928). His most important researches were on the embryology and anatomy of vertebrates, the epidermic markings of the palms and soles of the primates, and the teratology of vertebrates. He published *Invertebrate Zoology* (1894), *History of the Human Body* (1910), *Personal Identification* (1902); *Manual of Anthropometry* (1920); *Man's Prehistoric Past* (1923), *The Pedigree of the Human Race* (1925).

WILDER, THORNTON NIVEN (1897-). An American author. He was born at Madison, Wis., and graduated from Yale (1920), after having served for four months in 1918 in the Coast Artillery Corps. After graduation, he passed two years in Italy and one year in the Graduate School at Princeton. He then became a master at the Lawrenceville School. His first published work to win recognition was *The Cabala* (1926). This was followed by *The Bridge of San Luis Rey* (1928), and *The Angel That Troubled the Waters and Other Plays* (1928).

WILDMAN, EDWIN (1867-). An American editor and author, born at Corning, N. Y., and educated at the General Wesleyan Seminary, Phillips Exeter Academy, and Harvard University. He was editor and proprietor of newspapers in Georgia and New York, was a writer and war correspondent for *Leslie's Weekly* (1897-98), served as special war correspondent in the Philippines from 1898 to 1900, and was special commissioner with the allied troops during the

Boxer Rebellion in China (1900-01). From 1918 to 1920, he was president and editor of *The Forum*. He wrote *Writing to Sell* (1915); *America's Attitude toward the War* (1917); *American Leaders of Industry* (1919, 1921); *Famous Leaders of Character* (1922); *Founders of America* (1924); *Builders of America* (1925); *Jewish Leaders of America* (1928).

WILES, IRVING RAMSEY (1861-). An American portrait painter (see VOL. XXIII). His later portraits, particularly those of women, continued his able, academic manner. In 1919 he received the Maynard Portrait Prize from the National Academy of Design, New York City, and the Lippincott Prize from the Pennsylvania Academy, Philadelphia.

WILEY, HUGH (1884-). An American writer, born at Zanesville, Ohio, and educated in the public schools. From 1902 to 1917, he was an engineer and contractor. During the World War, he served in the Engineers Corps as captain. Besides contributing short stories, many of them in Negro dialect, to magazines, he wrote *The Waldrat* (1920), *Jade* (1921); *Lady Luck* (1921); *For Meals a Day* (1927); *Manchu Blood* (1927); *Here's Luck* (1928).

WILHELM, PRINCE OF SWEDEN. See **WILLIAM (WILHELM), PRINCE OF SWEDEN.**

WILKINS, ERNEST HATCH (1880-). An American college president. He was born at Newton Center, Mass., graduated at Amherst College, and took graduate work at The Johns Hopkins and at Harvard (Ph.D., 1910). After teaching Romance languages at Amherst (1900-04) and at Harvard (1906-12), he went to the University of Chicago as associate professor of Romance languages (1912-16) and from 1916 to 1927 held a full professorship there. He was also dean of the colleges of arts, literature and science from 1923 to 1926. In the World War, he was associate executive secretary of the war personnel board, national war work council, Y. M. C. A., and later directed the educational bureau in charge of educational work carried on by the Y. M. C. A. in camps in the United States. Since 1927 he has been president of Oberlin College. He is the author of *Dante—Poet and Apostle*, and *The Changing College* (1927); joint author of *Concordance to the Latin Works of Dante*, and translator of Papini's *Four and Twenty Munds*.

WILKINS, SIR GEORGE HUBERT (1888-). An Australian aviator and polar explorer. Born on a ranch in South Australia, he was graduated in electrical engineering from the Adelaide School of Mines (1906). He gave up an engineering career to become photographic correspondent of a London newspaper in the Balkan Wars. In 1913 he accompanied Vilhjalmur Stefansson on the latter's first arctic expedition. At the outbreak of the World War, he joined the Australian Flying Corps and was second in command of the Military History Department as official photographer.

After the War, Sir George conducted explorations for the British Museum of Natural History in northern Australia and the islands of the Pacific. He was second in command of the British Imperial Antarctic Expedition to Graham Land in 1920-21 and returned the following year with the ill-fated Shackleton-Quest Expedition. Turning next to aerial exploration, he headed the Detroit Arctic Expedition of 1925 and the *Detroit News-Wilkins Expedition* of 1927, both of which were in the main unsuccessful, due to unfavorable weather and other circumstances. On the latter

trip, he was forced down north of Alaska on the frozen Arctic Ocean. With his pilot, he succeeded in reaching an Eskimo settlement on foot, after great hardships. In April, 1928, he surprised the world by flying from Point Barrow, Alaska, to Green Harbor, Svalbard, Norway, covering the distance of 2200 miles over the polar regions in 20 hours. For this exploit, he was knighted by King George. Later the same year, he led an airplane expedition to the Antarctic, studied meteorological conditions, and flew over previously unexplored territory. In 1929 he returned to the Antarctic to survey Ross Sea by airplane and chart the region between Graham Land and the Bay of Whales. He wrote *Flying the Arctic* (1928), a book which definitely contributed to polar science.

WILLARD, DANIEL (1861-). An American railway president, born at North Hartland, Vt., and educated at the Massachusetts Agricultural College. He entered the railway service in 1879 and became assistant general manager of the Baltimore & Ohio Railroad in 1899 and its president on Jan. 15, 1910. In 1917 he became chairman of the Advisory Commission of the Council of National Defense and in the next year was made chairman of the War Industries Board. He was commanding colonel of engineers in the U. S. Army in 1918. Since 1926 he has been president of the board of trustees of The Johns Hopkins University. In April, 1929, he was awarded the gold medal of the National Institute of Social Sciences for distinguished social service.

WILCOX, WILLIAM RUSSELL (1863-). An American lawyer (see VOL. XXIII). From 1916 to 1918, he was chairman of the Republican national committee.

WILLEBRANDT, MABEL WALKER (1889-). An American lawyer, born at Woodsdale, Kan. She graduated from the Temple (Ariz.) Normal School in 1911 and from the law department of the University of Southern California in 1916. After teaching law for several years, she was admitted to the bar and practiced in Los Angeles. She acted as public defender of women and was attorney in some 2000 cases. In 1921 she was appointed Assistant Attorney General of the United States, the first woman to fill that office. She was placed in charge of the enforcement of the prohibition law, tax laws, and the Bureau of Federal Prisons. She played a prominent part as a supporter of Herbert Hoover in the presidential campaign of 1928. In May, 1929, she resigned as Assistant Attorney General and became counsel to Washington aviation interests.

WILLETT, HERBERT LOCKWOOD (1864-). An American theologian, born at Ionia, Mich., and educated at Bethany College, W. Va., and Yale, Chicago, and Berlin universities. In 1890 he was ordained to the ministry of the Christian Church and for several years was a pastor at Dayton, Ohio. He was associate professor (1909-15) and professor of Semitic languages and literature (since 1915) at the University of Chicago. From 1908 to 1920, he was minister of the Memorial Church of Christ of Chicago. He was well known as a lecturer and wrote *Life and Teachings of Jesus* (1898); *Prophets of Israel* (1899); *The Moral Leaders of Israel* (1916); and *Our Bible—Its Origin, Character, and Value* (1917). From 1916 to 1920, he was president of the Chicago Church Federation, and in the latter year became Chicago representative of the Federal Council of Churches of Christ in America.

WILLIAM II (FRIEDRICH WILHELM VICTOR ALBERT) (1859-). Ex-Emperor of Germany and ex-King of Prussia (see VOL. XXIII). The virtually absolute monarch of a great and powerful nation and generally considered an able and energetic leader, William II was probably the outstanding world figure at the outbreak of the World War. Its close found him bereft of every vestige of power, a fugitive from his own people, and hated by millions the world over. Animosity toward him gradually waned in the decade following the Armistice, only to be replaced by an almost complete indifference. His responsibility for the War remained a matter for debate. He repeatedly protested that he did his utmost to maintain peace and recent revelations indicate that he made half-hearted efforts which were nullified by the militaristic influences surrounding him, the belligerency of Austrian and Russian officialdom, and lack of cooperation on the part of the German Embassy at St. Petersburg. The Allies charged him with full responsibility and found support for their thesis in the memoirs of Prince Lichnowsky, German Ambassador to London in 1914, and in the works of Maximilian Harden, Dr. Wilhelm Muhlom, and other German writers.

William signed the order for the German mobilization on Aug. 1, 1914, and thereafter receded more and more into the background. His peace offer of 1916, his opposition to the peace resolution of the Reichstag in 1917, and his visits to the various battle fronts were his only significant activities. Failure of the German offensive of 1918 brought assurance from his generals that defeat was inevitable, but he refused to capitulate, urging the army to fight to the last. On Oct. 8, 1918, he was forced to announce his decision to "offer peace to the enemy." His tottering prestige was further shattered by an agreement among the other German sovereigns curtailing his power to make war and sign treaties and by President Wilson's refusal to treat with "Germany's present rulers." He then authorized the formation of a constitutional ministry, left Berlin with its threatening populace on October 30, and took refuge with the army. The Socialist Minister, on November 3, demanded his abdication, but he hesitated until November 28 before complying, although informed November 9 by Hindenburg that the army would not support him. Shortly afterward, he fled to Holland, where he lived for a year as the guest of Count Bentinck at Amerongen, and then purchased (1920) the chateau of Doorn near Utrecht, where he subsequently resided.

The Allies, in Article 227 of the Paris Peace Treaty, demanded his punishment for "a supreme offense against international morality." Plans for his trial before a special court of Allied jurists were balked by the refusal of Holland to extradite him. William's sons and a number of leading Germans, including Hindenburg, had offered to stand trial in his place and 432,000 Germans petitioned the new Republic to "save the Kaiser."

Joachim, one of his seven sons, committed suicide in 1920 and William's wife, the former Kaiserin Augusta-Victoria, died on Apr. 11, 1921. To the indignation of many former subjects, he married Princess Hermine of Schouaich-Carolath (née of Reuss) Nov. 5, 1921. He gradually abandoned hope of his restoration. In October, 1926, the Prussian government settled 250,000 acres of land and 15,000,000 gold marks

upon him in return for his confiscated property in Prussia. The failure of the Reichstag to renew the law for the defense of the Republic expiring June 27, 1929, left the way open for his return to Germany without sanction of the Government, but he did not avail himself of the opportunity.

Bibliography. William published *Comparative History, 1878-1914*, a defense of his reign (Eng. trans., 1921); *Ereignisse und Gestalten aus den Jahren 1878-1918* (1922); *Aus Meinem Leben 1859-1888*, memoirs (1927), and *Meine Vorfahren* (1929). The so-called "Willy-Nicky correspondence" between William and Czar Nicholas, brought to light by the Soviet government in 1917, was translated into French (1924) as *Correspondance entre Guillaume II et Nicholas II, 1894-1914*. Consult also *As We See It*, by René Viviani (Eng. trans., 1924), *Twelve Years at the Imperial German Court*, by Count Robert Zedlitz-Trutshel (Eng. trans., 1924); *Kaiser Wilhelm II*, by Emil Ludwig (1926); *Chronicles of the Prussian Court*, by Anne Topham (1926), *Schuld und Schicksal: Die Tragodie Wilhelms II*, by Josef Sonntag (1927); *Der Kaiser, das wahre Gesicht Wilhelms II*, by Edgar von Schmidt-Pauli (1928); and *Briefe 1882-1924 und Briefwechsel mit Kaiser Wilhelm II*, by Houston Steward Chamberlain (1928).

WILLIAM (FRIEDRICH WILHELM VICTOR AUGUST) (1882-) Ex-Crown Prince of Prussia and Germany (see Vol. XXIII). At the outbreak of the World War, he was put in command of the 5th Army on the west which won the battles of Longwy and Longuyon on Aug. 22 and 24, 1914. Later, he was nominally in charge of the unsuccessful operations against Verdun. In November, 1918, he followed his father to Holland and took refuge on the island of Wieringen in the Zuyder Zee. On Dec. 1, 1918, he formally renounced his rights of succession to the crowns of Prussia and the former German Empire.

WILLIAM (WILHELM), PRINCE OF SWEDEN and DUKE of SODERMANLAND (1884-). A Swedish writer and explorer, second son of King Gustavus V. His marriage to the Grand Duchess Maria Pavlovna of Russia (1908) was dissolved in 1914, leaving their son Prince Lenart with Prince William. He was a naval officer, and visited the United States (1907), India, Siam, Indo-China, and East Africa, and commanded a division of destroyers throughout the World War. It was then that he began to write, and he published his first book under the pseudonym L. Wica. At the close of the War, he resigned from the navy in order to pursue a literary career. He was dramatic critic for *Idun*, a Stockholm weekly, and traveled to Spitzbergen, Central America, and Central Africa to get material for his books. In 1927 he made a lecture tour in the United States, telling of the latter trip, on which he was supervising a collection for the Riksmuseum in Stockholm, and during which he nearly died of malaria. His writings include three volumes of poetry (1916-22); several collections of his short stories; the plays *Kinangozi* (1924), *Ombord (On Board)*, (1926), and *The Other One* (1927), and the books based on his travels: *In the Lands of the Sun* (1915), *Between Two Continents* (1921); *Among Pygmies and Gorillas* (1923); *At the Water Holes; Wild African Animals I Have Known* (1923); and *Sydfranskt* (Provence) (1926).

WILLIAM AND MARY, COLLEGE OF A coeducational State institution at Williamsburg,

Va., founded in 1693. Student enrollment increased from 242 in 1916 to 1356 in 1928; the faculty from 21 to 70, in the same period; and the library from 15,000 to 60,000 volumes. In 1918 women were admitted to the college for the first time and a dormitory was built for them in 1921. A men's dormitory and a gymnasium were opened in 1925. Courses in commerce, accounting, and other business subjects were offered in 1919. The Kate Waller Barrett Dormitory for Girls, the William Barton Rogers Science Hall, and Old Dominion Hall for men were completed in 1927. President, Julian A. C. Chandler, LL D.

WILLIAM JEWELL COLLEGE. A coeducational institution of higher learning at Liberty, Mo., founded in 1849. Student enrollment in the fall of 1928 was 420. Productive funds in the same year were \$1,148,933.03 and income \$136,439.96. Early in 1929, a gymnasium costing \$150,000 was completed. President, John F. Herget, A.M.

WILLIAMS, ALFORD JOSEPH, JR. (1891-). An American naval aviator, who was born in New York City and educated at Fordham University (A. B., 1914) and the Georgetown Law School. He became an aviation student in 1917 and was commissioned ensign in the U. S. Naval Reserve Force in November, 1918. He entered active service in February, 1922, as test pilot at the Hampton Roads naval air base, with the rank of Lieutenant, and in November, 1926, was transferred to the Bureau of Aeronautics at Washington, D. C. He established two world's speed records at the Pulitzer Air Races in St. Louis in 1923, where he won first place in the 100- and 200-kilometer races with a speed of 243.81 miles an hour and 243.67 miles an hour, respectively. Later, he established another record by flying 266.59 miles an hour for three kilometers. In 1929 he was selected to represent the United States in the Schneider Air Races held in England, but was forced to withdraw when preliminary tests of his plane was unsatisfactory.

WILLIAMS, CHARLES TURNER (1874-). An American banker and Red Cross official, born at Warrenton, N. C., and educated in the public schools. He worked as a stenographer, newspaper reporter, and railroad executive before entering the private banking business in Richmond, Va., in 1904. In 1910 he became interested in investment banking in Baltimore. During 1917-19 he was captain in the Red Cross Mission to Rumania. He crossed Siberia into Russia with a trainload of supplies, thence to Archangel, and carried the first supplies from the United States south to Rumania. In 1918 he was promoted to the rank of major and placed in charge of the American Red Cross Mission which took relief supplies to Archangel.

WILLIAMS, JESSE LYNCH (1871-1929). An American journalist, author, and playwright (see Vol. XXIII). He received the Litt. D. degree from Princeton in 1919 and in 1925-26 was holder of a fellowship in creative arts at the University of Michigan. His later works were the plays *And So They Were Married*, comedy (1915), *Why Marry?*, a new edition of the same play which won the Pulitzer Prize (1917); *Why Not?*, comedy (produced New York, 1922); *Lovely Lady*, comedy (produced Washington, 1925).

WILLIAMS, RALPH VAUGHAN (1872-). An English composer, born at Down Ampney in Wiltshire. He received his musical education at the Royal College of Music under H. Sharpe and

G. Moore (piano), W. Parratt (organ), and Hubert Parry and Charles Villiers Stanford (composition). In 1897-98 he was in Berlin with Max Bruch, and later, developing a strong leaning toward impressionism, he spent some time with Ravel in Paris. With the exception of a short period as organist at South Lambeth Church (1896-99) and as extension lecturer at Oxford University, he held no official position but devoted his entire time to composition until, in 1920, he became professor of composition at the Royal College of Music and conductor of the London Bach Choir, which latter post he resigned in 1928. He wrote for orchestra, *A London Symphony*, *Pastoral Symphony*, *The Solent*, *Bucolic Suite*, *Heroic Elegy*, *Norfolk Rhapsodies* (three), *Harnham Down*, and *Boldrewood*, and a suite, *Flos Campi*, a symphonic impression, *In the Fen Country*, *Concerto Accademico*, for violin and orchestra; *Fantasia*, for piano and orchestra; the choral works with orchestra, *Toward the Unknown Region*, *Willow-wood*, *A Sea Symphony*, *The Garden of Prosperpine*, *Five Mystical Songs*; incidental music to Aristophanes' *The Wasps* and Ben Johnson's *Pan's Anniversary*; a mass in G minor; two piano quintets; two string quartets; many part-songs and songs; the operas, *The Shepherds of the Delectable Mountain* (London, 1922) and *Hugh the Drover* (London, 1924, Washington, 1928), a ballet, *Old King Cole* (Cambridge, 1923).

WILLIAMS, SIDNEY CLARK (1878-). An American editor and author, born at Wells, Me., and educated in the public schools and privately. For several years, he was on the staff of papers in Maine and in Boston. He was literary editor and dramatic critic of the *Boston Daily Advertiser* (1912-14), literary editor of the *Boston Herald* (1914-19), of the *Philadelphia North American* (1920-25), and the *Philadelphia Inquirer* (since 1925). He wrote *A Reluctant Adam* (1915), *The Eastern Window* (1918); *The Body in the Blue Room* (1922); *In the Tenth Moon* (1923); *Mystery in Red* (1925); *The Drury Club Case* (1927).

WILLIAMS COLLEGE. A nonsectarian institution for the higher education of men at Williamstown, Mass., founded in 1793. Student enrollment increased from 499 in 1914 to 807 in 1928; the faculty from 59 to 82 members, in the same period; the library from 78,000 to 125,000 volumes; and productive funds from \$1,842,243 to \$5,591,579.66. The Institute of Politics, which holds its meetings during the summer, was authorized by vote of the trustees of the college in 1913, but the members of the board of advisers were not chosen until 1919. Annual sessions have been held since 1921. See **POLITICS**, **INSTITUTE OF**. A field house was built in 1926 and in that year, honors courses were introduced for juniors and seniors of good scholarship. A gymnasium and Lehmann Hall, a freshman dormitory, were opened in 1928. President, Harry A. Garfield, L.H.D., LL.D.

WILLINGTON, FREEMAN FREEMAN-THOMAS, FIRST VISCOUNT (1866-). A British Governor General of Canada. He was a Liberal member of the British Parliament for Hastings (1900-06) and for the Bodmin Division of Cornwall (1906-10). He served as Junior Lord of the Treasury from 1905 to 1912, as Governor of Bombay (1913-19) and of Madras (1919-24). In 1924 he was delegate for India at the Assembly of the League of Nations. Since 1926 he has been Governor General of Canada.

WILLIS, FRANK BARTLETTE (1871-1928). A United States Senator. He was born at Lewis Center, Ohio, and graduated from Ohio Northern University, where for twelve years he held the professorship of history and economics, serving also as a member of the Ohio House in 1901-04. In 1906, having studied law, he was admitted to the bar. He represented the Eighth Ohio District in the Sixty-second and Sixty-third Congresses (1911-15) as a Republican, and in 1914 was elected governor for the term ending 1917. In 1920 he was elected United States Senator to succeed Warren G. Harding, and was reelected in 1926. He was noted as a political orator, having placed Mr. Harding in nomination for President at the Republican National Convention. He died suddenly when about to deliver a political address in Ohio. At the time of his death, he was chairman of the Senate Committee on Territories and Insular Possessions.

WILLIS, H (ENRY) PARKER (1874-). An American economist (see VOL XXIII). He was professor of banking at Columbia University (after 1917), editor-in-chief of the *New York Journal of Commerce* (since 1919), secretary (1914-18) and director of research (1918-22) of the Federal Reserve Board, Washington, D. C., president of the Philippine National Bank (1916-17), and chairman of the Banking Commission of the Irish Free State (1926-27). His later publications include *The Modern Trust Company*, with Kirkbride and Sterrett (1910); *Business and Banking*, with G. W. Edwards (1921); *The Federal Reserve System* (1923); and *Federal Reserve Banking Practice*, with W. H. Steiner (1925).

WILLOUGHBY, WILLIAM FRANKLIN (1867-). An American economist, born in Alexandria, Va., and educated at The Johns Hopkins University. He was treasurer of Porto Rico (1901-07), president of the executive council of the Porto Rican Legislative Assembly during 1907-09, and assistant director of the United States Census (1909-11). A member of the President's Commission on Economy and Efficiency (1911-12), he was then called to the chair of jurisprudence and politics at Princeton University, but resigned in 1916 to become director of the Institute for Government Research. In addition to many reports and special articles, he is the author of *Workingmen's Insurance* (1898); *Territories and Dependencies of the United States* (1905); *The Problem of a National Budget* (1918); *The Government of Modern States* (1919); *Government Organization in War Time and After* (1919); *Reorganization of the Administrative Branch of the National Government* (1923); *The National Budget System, with Suggestions for Its Improvement* (1927); and *The Legal Status and Functions of the General Accounting Office* (1927).

WILLSIE, HONORE (MRS. WILLIAM MORROW) (?-). An American editor and writer, born at Ottumwa, Iowa, and educated at the University of Wisconsin. She was editor of *The Delineator* in New York City from 1914 to 1919. Her novels portray Western life. *Heart of the Desert* (1913) was her first published novel, and won immediate recognition. Others were *Still Jim* (1915); *Lydia of the Pines* (1916); *Benefits Forgot* (1917); *The Forbidden Trail* (1919); *The Enchanted Canyon* (1921); *Judith of the Godless Valley* (1922); *We Must March* (1925); *Forever Free* (1926); *The Father of Little Women* (1927); *Mary Todd Lincoln* (1928);

With Malice Toward None (1928); *The Splendor of God* (1929).

WILLY, COLETTE. See COLETTE.

WILMER, WILLIAM HOLLAND (1863-). An American physician and ophthalmologist, born in Powhatan County, Va., and educated at the Episcopal High School, Alexandria, Va., the University of Virginia, the New York Polyclinic, and in Europe. He spent his internship at Mt. Sinai Hospital, New York, was an instructor in the New York Polyclinic, and then practiced in Washington, D. C. (1889-1925), meanwhile serving as professor of ophthalmology at Georgetown University (1906-25), and as surgeon to the Episcopal Eye, Ear, and Throat Hospital (1895-1925). In the latter year, he went to The Johns Hopkins University, becoming director of the Wilmer Ophthalmological Institute there, professor of ophthalmology and ophthalmologist in chief to The Johns Hopkins Hospital. A new building for the institute was dedicated in 1929. During the World War, Dr. Wilmer was surgeon in charge of the U. S. Army Medical Research Laboratories in France, with the rank of colonel, winning the D. S. M. for his services. Later, he became a brigadier general in the Medical Reserve Corps. He received an honorary Sc. D. degree from Princeton in 1926. He is a member and officer of numerous medical societies.

WILMINGTON. The largest city of Delaware. The population increased from 87,411 in 1910 to 110,168 in 1920, and to 128,500 in 1928, by estimate of the U. S. Bureau of the Census. The enactment of a zoning ordinance has provided districts for residences, office buildings, and factories, and defines the type of construction in each zone. During 1927 Wilmington experienced its greatest construction year, 1281 building permits, representing a value of \$6,927,279, being issued. A reinforced concrete bridge was built in 1923 across Brandywine Creek was a memorial to the veterans of the World War. It is 720 feet long and 72 feet wide and is supported by three arches, the longest of which has a span of 250 feet. The same year, a new public library was erected at a cost of \$535,224. In 1923 the city completed the construction on the Delaware and Christiana rivers of a deep-water terminal costing \$3,410,000. It is fully equipped with loading and unloading facilities, railroad sidings, transit and storage sheds, and has berthing space for five average-sized vessels. It is the first unit of an extensive port-development plan. The Wilmington airport, Bellanca Field, which is located approximately 6 miles south of the city on the Delaware River, is on the New York-Atlantic air route. In 1925, 13,993 persons were employed by approximately 190 industrial establishments in Wilmington and received \$17,926,025 in wages; the value of products manufactured was \$81,705,752. The clearings of 16 banks in 1928 amounted to \$222,311,141; the assets of 16 building and loan associations were \$6,310,537. The assessed valuation of property in 1928 was \$136,050,650; the net debt in 1927 was \$10,455,201.

WILMOTTE, MAURICE (1861-). A Belgian professor of philology at Liège University, born in Brussels. He was a member of the Royal Academy of Brussels. His works include *La Belgique morale et politique* (1902); *Études Critiques sur la Tradition littéraire en France* (1909); *La Culture française en Belgique* (1912).

WILSON, CHARLES STETSON (1875-). An American diplomat, born at Bangor, Me. He began his diplomatic career as secretary of

legation in Greece, Rumania, and Serbia in 1901. After serving in the legations in many capitals, among them Buenos Aires, Rome, and Havana, he was secretary of the Embassy at Madrid (1916-18), and later counselor there and chargé d'affaires at Sofia in Bulgaria (1918-21). He was named Minister to Bulgaria in October, 1921. In 1928 he was transferred to Rumania.

WILSON, CHARLES THOMSON REES (1869-). A British physicist. He was born at Glencorse, Midlothian, and educated at Owens College, Manchester, Sidney Sussex College, and Cambridge. Since 1895 he has been engaged in research on condensation of nuclei of ions and atmospheric electricity. He has been Jacksonian professor of natural philosophy at Cambridge since 1925. In 1927 he shared with Professor Arthur H. Compton, of the University of Chicago, the Nobel Prize in physics, awarded for his method of observation of electric particles.

WILSON, EDWIN BIDWELL (1879-). An American mathematician, born in Hartford, Conn., and educated at Harvard and Yale universities, and in Paris. He became instructor in mathematics at Yale in 1900 and assistant professor in 1906; a year later he accepted a call to the Massachusetts Institute of Technology, where he was professor of mathematical physics and head of the department of physics during 1917-22. Since 1922 he has been professor of vital statistics at the Harvard School of Public Health. He was president of the American Academy of Arts and Sciences (1927), and editor of the *Proceedings of the National Academy of Sciences* (since 1915). His original investigations include studies of vector analysis, multiple algebra, geometry, mechanics, and relativity. His publications include *Gibbs' Vector Analysis* (1910), *Advanced Calculus* (1912); and *Aeronautics*, Lowell Lectures (1920).

WILSON, SIR HENRY HUGHES, FIRST BARONET (1864-1922). A British field marshal, born in Ireland. He joined the army in 1884 and served in Burma and South Africa. Promoted to the rank of colonel in 1904, he later became commandant of the staff college. In 1910 he was appointed director of military operations and in 1914, deputy chief of the general staff and liaison officer between the French and British forces. He commanded the 4th Army Corps in 1915, went to Russia on the Milner mission in 1917, and later served as British military representative on the new Supreme War Council. In February, 1918, he became chief of the Imperial General Staff, and in 1919, a field marshal and baronet. He resigned from the War Office in 1921 and was elected a member of the Irish Parliament in Ulster the next year. Shortly afterward, he was assassinated by two men who were connected with the Sinn Féin Army.

WILSON, HUGH ROBERT (1885-). An American diplomat, who was born at Evanston, Ill., and graduated from Yale. He later studied at the École Libre des Sciences Politiques, Paris. He was private secretary to the American Minister to Portugal in 1911 and Secretary of Legation at Guatemala in the following year. After serving in legations and embassies at Buenos Aires, Berlin, Vienna, Berne, and Tokyo, and at Washington, D. C., he became chief of the Division of Current Information, State Department (1924-27). Since April, 1927, he has been Minister to Switzerland. He served as secretary of the Conference for the Limitation of Naval Armaments at Geneva in 1927. He also acted as American

representative to the Geneva conferences (1927) on communications and transit and for abolition of import and export prohibitions and restrictions.

WILSON, JAMES THOMAS (1861-). A British anatomist, born at Moniaive, Dumfriesshire, Scotland. He was graduated from Edinburgh University in 1883 and soon afterward was made demonstrator of anatomy. He was called to the University of Sydney, N. S. W., Australia, in 1890, remaining until 1920, when he was made professor of anatomy at the University of Cambridge. In 1924 he was chosen president of the Anatomical Society of Great Britain and Ireland. He is the author of many papers on human and comparative anatomy and embryology.

WILSON, SAMUEL ALEXANDER KINNIER (?-). A British physician and neurologist, born in New Jersey, U. S. A., where his father, an Irish clergyman, was temporarily located. He was educated at the University of Edinburgh (M.D., 1911) and afterward studied at Leipzig and Paris. He specialized in neurology in London and became associated with several clinics. Through brain studies, he succeeded in isolating a new disease or syndrome, technically called degeneration of the lenticular nucleus, but more familiarly known as "Wilson's disease." He translated into English Meige and Feindel's monograph, *Les tics*, and is editor of the *Journal of Neurology and Psychopathology*. In 1926 appeared his monograph on aphasia.

WILSON, (THOMAS) WOODROW (1856-1924). The twenty-eighth President of the United States (see VOL XXIII). The first two years of President Wilson's administration were marked by noteworthy achievements; the reduction of the tariff, the establishment of the Federal Reserve Bank System (1913), the Clayton Anti-trust Act and the Federal Trade Commission (1914) were in large part due to his personal leadership of the Democratic Party. The "new freedom" of domestic policy was marked by the keynotes of democracy and justice in foreign affairs. He withdrew from the Chinese financial consortium, deprecated economic imperialism and territorial aggrandizement in Latin America, tried to make amends to Colombia for the Panama Canal seizure, and pursued his course of "watchful waiting" with respect to Mexico, intervening only reluctantly when popular opinion demanded bold action to satisfy the national honor. The outbreak of the World War elicited from him an appeal to his fellow-countrymen to "be impartial in thought as well as in action." From the beginning, he believed it would be the mission of the United States to step forward, at the proper moment, as disinterested peacemaker. At times, this hope was imperiled; the *Lusitania* and *Sussex* notes brought the United States to the verge of a break with Germany; but he could go to the country, in the election of 1916, on the issue that "he kept us out of war," and his reelection in November, 1916, by a popular plurality of nearly 600,000, seemed to express the nation's approval of his course.

The events of 1917 clearly indicated that the lot of the United States could not remain that of a disinterested spectator. Germany's announced policy of unrestricted submarine warfare, the failure of her leaders to realize that President Wilson's severance of diplomatic relations threatened war, the continuance of submarine outrages, compelled him to ask Congress on Apr. 2, 1917, for a war declaration. Only then

did he give full utterance to his belief that German autocracy must be crushed and the world "made safe for democracy." The war was prosecuted to the fullest extent of American resources.

The United States under President Wilson gained a material leadership first and then a spiritual one. Wilson's historic "Fourteen Points" speech of Jan. 8, 1918, and his address of Sept. 27, 1918, promising justice even to "those to whom we do not wish to be just," won him so commanding a position as spokesman of the Allies that to him Germany's peace overtures were directed. The calling of the Peace Conference found him ready to attend in person, and the extraordinary enthusiasm with which the peoples of Europe greeted him, as the prophet of justice and the hope of the world, convinced him of the wisdom of his decision. The story of his courageous fight for a just peace and the League of Nations, of his departure for the United States in February, 1919, with the draft of the Covenant, of his return to Paris in March, his conflicts with the Italians regarding Fiume, with the French concerning the Rhine, and with the Japanese regarding Shantung, and his voyage home at the end of June with the completed Peace Treaty is told in the article **PEACE CONFERENCE AND TREATIES**. The making of the peace had estranged him from Colonel House and Secretary Lansing; the opposition of the Republican Senate to the Treaty strengthened his resolve to make plain to the country the nature of his achievement. On Sept. 3, 1919, he began his coast-to-coast tour, but the great strain placed on him compelled him to retire to Washington, a very sick man. The disappointment of the rejection of the treaty by the Senate in March, 1920, was tempered for him somewhat by knowledge of the instrument's ratification by the European Powers and the establishment of the League itself in January, 1920. The last blow showed him how unsympathetic public opinion was: the presidential elections of November, 1920, to which he had looked for a "solemn referendum" on the League, gave an overwhelming majority to the Republican candidate, Warren G. Harding, who opposed the League.

On Mar. 4, 1921, he retired to private life and continued his residence in Washington. He lived to see the League of Nations firmly established, and he continued to deplore America's "sullen and selfish isolation" (speech of Nov. 11, 1923). He died on Jan. 30, 1924. See **WORLD WAR, DIPLOMACY OF THE; UNITED STATES, History; PEACE CONFERENCES AND TREATIES**. Consult *Life of Woodrow Wilson*, by William Allen White (1924); *Woodrow Wilson and World Settlement*, by Ray Stannard Baker (3 vols., 1922); *The Public Papers of Woodrow Wilson*, edited by Ray Stannard Baker and William E. WILSON DAM. See **DAMS**.

WINDAUS, ADOLF (1876-). A German chemist, winner of the Nobel Prize for chemistry in 1928. A professor of chemistry at the University of Göttingen and head of the Chemical Institute in that city, he received the Nobel Prize for his successful repetition of experiments proving that ultra-violet light confers anti-rachitic properties on ergosterol. He is a member of the German Academy of Natural Sciences.

WOODROW WILSON

St. Lucia. These constitute three separate colonies but are administered by a single governor. Total area, 524 square miles; total population in 1911, 157,204; in 1927, 178,459 (estimated). The leading products are cocoa, lime juice, sugar, rum, cotton, nutmegs, mace. Commercial and financial statistics for 1927 follow (1913 figures in parentheses): imports, £816,549 (£694,219); exports, £865,950 (£756,809); revenue, £294,468 (£193,121); expenditure, £277,196 (£192,353); public debt, £476,711.

WINNIPEG. The capital of the Province of Manitoba and the fourth city in size in Canada. The area is 15,961 acres and the population which in 1921 was 179,087, in 1928 was estimated to be 202,377. In 1918 the Board of Control, or executive body of the city government, was abolished as a result of a popular referendum. In 1920 the Winnipeg Charter was amended, reducing the number of wards into which the city was divided from 7 to 3 and increasing the number of aldermen from 14 to 18, three aldermen being elected annually from each ward for a period of two years. Since that year, the city government has been vested in the mayor and aldermen who constitute the City Council. The council as a whole is the legislative body and carries on its executive work through standing committees. On July 15, 1920, the Parliament Buildings of the Manitoba Legislature were officially opened, the occasion being the fiftieth anniversary of Manitoba's entry into the confederation. Winnipeg supplies through its municipal hydroelectric system, which was inaugurated in 1905, the cheapest electric power of any city in North America. In 1919 the city opened a notable water-supply system by which 100,000,000 gallons of soft water could be delivered daily to the city from Shoal Lake, 96 miles distant. The cost of this construction was more than \$15,000,000. The city also owns and operates its central steam-heating system, street-lighting system, stone quarry, and asphalt plant. Winnipeg is the railroad centre of western Canada, 27 main and branch railways radiating from it. Its stock yards are the largest in Canada, representing an investment of more than \$1,000,000 and covering some 200 acres of land. In Greater Winnipeg, including the city of St. Boniface, there are more than 600 industrial establishments whose output is more than \$100,000,000 annually. The pay roll of these industries exceeds \$23,000,000 annually. Winnipeg stands third among Canadian cities in point of bank clearings, which in 1928 amounted to \$3,443,151,986. In 1928, 2652 building permits, representing a value of \$10,547,400, were issued. The assessed valuation of property in 1928 was \$229,748,400; the net general debt was \$4,275,841.

WINTER, GEORG (1856—). A German gynecologist and obstetrician, distinguished for his efforts in the prevention of cancer. Born in Rostock, he received his medical education at the University of Heidelberg, and in 1897 was made professor of obstetrics and diseases of women in the University of Königsberg and director of the clinic for women. In 1896, in collaboration with Ruge, he published his important work, *Lehrbuch der Gynäkologische Diagnostik*, which was translated into Russian and English. His small work, *Die Bekämpfung des Uteruskrebs*, appeared in 1904. His prolonged study of the subject of falling birth rates led to the publication of two companion books, *Die Indikationen zur Künstlichen Unterbrechung der Schwangerschaft* (1918)

and *Die Indikationen zur Künstlichen Sterilisation der Frau* (1920). In 1922 a *Festschrift* volume was published and in 1927 he published *Lehrbuch der operativen Geburtshilfe*.

WIRTH, KARL JOSEPH (1870—). A German public official, born in Baden and educated at the University of Freiburg. He became a teacher of economics at the Technical College in Freiburg in 1908. As a member of the Catholic Centre Party, he was elected to the Diet of Baden in 1913 and was Minister of Finance, 1918–20. He was elected to the Constituent Assembly by the Reich at Weimar in 1919 and received the portfolio of Finance in March, 1920. When the ultimatum on reparations was presented by the Allies in May, 1921, Dr. Wirth was asked to form a new cabinet. He secured the cooperation of Democrats, Catholics, and Socialists. The new ministry then accepted the Allies' reparation terms, and by Aug. 31, 1921, the first half-yearly installment had been paid. Dr. Wirth stood his ground solidly against various attempts to overturn the German Republic, but did not conceal his fear that the partition of Upper Silesia would render it impossible for Germany to fulfill her obligations. He resigned as chancellor in 1922 and has since been a leading member of the Reichstag.

WISCONSIN. The twenty-fifth State in size (56,066 square miles) and the thirteenth in population; capital, Madison. The population was 2,333,860 in 1910 and 2,632,067 in 1920, an increase of 12.8 per cent; estimated population, 1928, 2,933,000. The white population increased from 2,320,555 (1910) to 2,616,938 (1920); Negro, from 2900 to 5201; native white, from 1,807,986 to 2,156,810. The foreign-born white population decreased from 512,569 to 460,128. Both urban and rural populations mounted, the former from 1,004,320 to 1,244,568; the latter from 1,329,540 to 1,387,499. The growth of the principal cities was as follows: Milwaukee (q.v.), 1910, 373,857, 1920, 457,147; Racine, 38,002 to 58,593; Kenosha, 21,371 to 40,472. Superior's population decreased, in 1910 it was 40,384; in 1920, 39,671.

Agriculture. As Wisconsin is one of the important grain-growing States, agricultural conditions have been materially affected by the general agricultural situation during the War and in the post-war period. The general situation is discussed fully under AGRICULTURE and in the articles on various grains, WHEAT, CORN, and others. The number of farms increased 6.9 per cent, or from 177,127 in 1910 to 189,295 in 1920, and rose further to 193,155 in 1925, the total area of land in farms increased from 21,060,066 in 1910 to 22,148,223 acres in 1920, but fell thereafter to 21,850,843 in 1925. The improved land in farms totaled 12,452,216 acres in 1920. The percentage of the total area in farms in 1925 was 61.8. The total value of farm property rose 89.5 per cent, or from \$1,413,118,785 in 1910 to \$2,677,282,997 in 1920, falling thereafter to \$2,272,402,472 in 1925; the average value per farm was \$7978 in 1910, \$14,143 in 1920, and \$11,765 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 162,052 were operated by owners; 1167, by managers; and 29,936, by tenants. The compar-

ative figures for 1910 were 151,022; 1451; and 24,654. White farmers in 1920 numbered 188,632; colored farmers, 663. In 1910 white farmers numbered 176,536; colored, 591. The number of farms reported as under mortgage, 94,258 in 1920, fell to 90,819 in 1925. The total number of cattle was 3,050,829 in 1920; 3,010,493 in 1925; dairy cows numbered 2,763,483 in 1920; 1,951,527 in 1925. Sheep numbered 470,991 in 1920, 309,758 in 1925; swine, 1,596,419 in 1920; 1,363,135 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 91,203,000 bushels; wheat, 2,141,000; oats, 108,532,000; barley, 26,898,000; rye, 2,171,000; potatoes, 31,97,000; hay, 5,296,000 tons; tobacco, 49,025,000 pounds. Comparative figures for 1913 are corn, 66,825,000 bushels; wheat, 3,065,000; oats, 83,038,000 barley, 18,125,000; rye, 7,438,000; potatoes, 32,155,000; hay, 3,848,000 tons; and tobacco, 50,740,000 pounds.

Mining. Wisconsin is not among the States most important in mineral production. Its chief minerals in the order of their value are stone, zinc, sand and gravel, mineral waters, and iron ore. Lime also is produced. The iron shipped from mines in 1914 was 591,595 long tons, valued at \$1,178,610; 1916, 1,529,459, \$3,644,542; 1918, 1,167,640, \$3,786,408; 1920, 1,067,159, \$4,333,307; 1921, 1,177,755, \$300,954; and 1926, 1,238,885, \$3,178,156. The value of clay products is about \$1,000,000 annually. The total value of the mineral production in 1926 was \$20,711,736, compared with \$19,630,114 in 1920; \$18,772,601 in 1919; \$20,091,146 in 1918, and \$11,140,365 in 1914.

Manufactures. Wisconsin as an industrial State developed greatly after 1909. In 1920 it had 21 cities with more than 10,000 inhabitants. These contained 36.6 per cent of the total population and in 1919 reported 63.9 per cent of the State's manufactured products. There were in the State 9721 manufacturing establishments in 1909, 10,393 in 1919; 7262 in 1925, and 7473 in 1927. Wage earners in manufactories numbered 263,949 in 1919; 247,341 in 1925; and 247,722 in 1927. Capital invested amounted to \$605,657,324 in 1909 and \$1,361,729,196 in 1919. The value of products was \$590,305,538 in 1909; \$1,846,984,307 in 1919; \$1,859,243,930 in 1925, and \$1,973,653,261 in 1927. Increase in value of products evidenced in 1919 was partly due to the higher prices of war time. The principal industry is the manufacture of automobiles and parts. The value of these was \$11,440,000 in 1909; \$119,381,000 in 1919; \$215,847,361 in 1925; \$177,452,567 for motor vehicles, and \$87,691,426 for parts in 1927. Slaughtering and meat-packing products attained \$27,217,000 in 1909, \$106,207,000 in 1919; and \$75,793,912 in 1927. The leather industries had a product valued at \$44,608,000 in 1909; at \$94,762,000 in 1919; and \$35,077,010 in 1927. There were in Milwaukee in 1909, 1764 manufacturing establishments, with a product valued at \$208,324,000; and in 1919, 2093 with \$576,161,000; the products in 1925 were valued at \$541,912,000. In 1909 Racine had 142 establishments, with a product valued at \$24,673,000; 1919, 230, with \$120,027,000. Similar figures for Kenosha are in 1909, 62 with \$23,182,000; 1919, 84 with \$103,726,000. Other important manufacturing cities are Green Bay, Beloit, La Crosse, Sheboygan, Superior, and Appleton.

Education. Education in Wisconsin has always been maintained at a high degree of excel-

lence, and notable further progress has been made in recent years. Special attention was given to improvement in the administration of elementary schools. Results are shown by the fact that while 49 out of every 100 pupils finished the eighth grade in 1914-16, 60 out of every 100 finished in 1918-20. This increase, indicating an upward trend in the holding power of the elementary school in the State, may be attributed in part to an awakened interest in education on the part of parents, to the enforcement of the compulsory-education law, and to changes gradually taking place in the State school organization.

Special attention at the same time has been given to increasing the efficiency of the high schools. There are in the State four types of secondary schools, the State graded schools, four-year high schools, junior high schools, and senior high schools. The number of high schools in the State increased from 318 in 1913 to 407 in 1920. State supervision of the public high schools was in charge of five supervisors, the primary purpose of such supervision was to assist local school authorities and teachers in the improvement of their schools.

The junior-high-school law, which was enacted in 1919, provided for the establishment of such schools under the required conditions. The State graded schools, created by a legislative act in 1901, had long before become a feature of the Wisconsin educational system. In 1921-22 there were 226 State graded schools of the first class, which means schools of three or more departments; and 352 graded schools of the second class, each of two departments. Every county contained at least one graded school. Vocational work has been carried on since 1913, when the Legislature gave high schools special financial aid to further the introduction and maintenance of certain so-called vocational training courses, including courses in manual training, domestic science, agriculture, and commercial science, the system was developed to an exceptionally high degree of efficiency.

Total enrollment in schools in 1925-26 was 542,584. Of this number, 126,696 were enrolled in the secondary grades, while enrollment in the kindergarten and elementary grades totaled 415,888. The expenditures in the academic year 1925-26 for public day schools were current, \$38,780,608; outlays, \$6,735,432. The percentage of illiteracy in the State decreased from 4.2 in 1910 to 3.2 in 1920, in the native white population, from 0.9 to 0.6, in the foreign-born white, from 8.9 to 8.8, and in the Negro population, from 5.3 to 4.8.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were for maintenance and operation of governmental departments, \$31,070,324 (of which \$5,562,672 was aid to local education); for interest on debt, \$123,459; for permanent improvements, \$13,656,704; total, \$44,850,487 (of which \$15,810,474 was for highways, \$4,444,044 being for maintenance and \$11,366,430 for construction). Revenue was \$46,428,373. Of this, property and special taxes formed 38.8 per cent; departmental earnings and charges for officials' services, 9.6 per cent; sales of licenses and taxation of gasoline, 39.5 per cent. State taxes levied amounted to \$7,451,220. Only street railways were subjected to property tax for State purposes. Net funded State debt on June 30, 1927, was \$1,663,700.

Political and Other Events. Senator La Follette, until his death in 1925, remained the conspicuous Republican leader of the State. He was, however, opposed both by Governor Philipp, who was three times elected, and by Senator Lenroot, who was twice elected to the Senate. E. L. Philipp, Republican, was elected governor 1914; the Democrats elected Paul O. Husting Senator. Senator La Follette was reelected in 1916, and so was Governor Philipp. For President, Hughes received 221,323 votes; Wilson, 193,042. The stand taken by Senator La Follette on government war measures aroused bitter feeling in 1917. Senator Husting was accidentally killed in 1917, and in 1918 Irvine L. Lenroot was chosen to succeed him. Governor Philipp was reelected in 1918. In 1920 the Republicans elected, as governor, John J. Blaine. Senator Lenroot was reelected. For President, Harding received 498,576 votes; Cox, 113,422. Governor Blaine was reelected in 1922 and 1924; Senator La Follette was reelected in 1922. As third-party candidate for President in 1924, on a Progressive ticket, La Follette carried the State with him, but won no other State. The vote for President in Wisconsin was. La Follette, 453,678; Coolidge, 311,615; Davis, 68,115. After his father's death, Robert M. La Follette, Jr., was appointed to the resulting Senate vacancy and entered the Senate Republican group; he was reelected in 1928. F. R. Zimmerman, Republican, was elected governor in 1926, in 1928, another Republican, W. J. Kohler. Governor Blaine was elected Senator in 1926. Hoover, for President, received in 1928, 544,205 votes; Smith, 450,259.

Legislation. In 1917 the laws relating to criminal procedure were amended, and provision was made for absentee voting. The banking and insurance laws of the State also were amended. In 1919 a special session passed a soldiers'-bonus law providing \$10 for each month of service. The act was submitted to the people and was adopted. The labor laws were amended and a State Board of Conciliation was created. The Legislature of 1921 provided for a juvenile department for the care of dependent, defective, and delinquent children. In 1923 the Legislature made the sale of narcotics a felony and the possession of drugs illegally obtained a crime. The labor laws were amended by further limiting use of injunctions in labor disputes. The session of 1925 proposed a referendum in favor of 2 75 per cent of alcohol in beer, which was carried in 1926 but was nugatory under the Volstead Law. The Industrial Commission was empowered in 1925 to fix a minimum wage. A constitutional referendum to permit the recall of officials was proposed in 1925 and carried by popular vote in 1926. State income-tax laws were revised in 1927.

WISCONSIN, UNIVERSITY OF. A coeducational State institution at Madison, Wis., founded in 1848. The student enrollment increased from 4874 in the fall of 1914 to 9042 in the fall of 1928; in the same period, the faculty was increased from 694 to 1284 and the library, from 483,000 volumes to 796,000 volumes and 387,000 pamphlets. The income in 1914 was \$2,758,118; in 1928, \$7,951,001.65. A physics building was constructed in 1916, and the student infirmary and Bradley Memorial Hospital were built in 1920. In 1921 work was begun on the Wisconsin State Hospital, for which the Legislature appropriated \$1,500,000. The degree of Ph.B. was established in 1918, with stress on the scientific and without foreign-language requirements. In

1925 a union memorial building and a men's dormitory were erected and an addition to Bascom Hall was built. The courses in the medical school, in pharmacy, and in music were changed in this year from two to three years, and in 1926 the medical-school course was lengthened to four years leading to the M.D. degree. In 1927 schools of commerce and journalism were formed from courses formerly offered in those subjects, with two years of letters and science as entrance requirements; and an experimental college was opened under the direction of Dr. Alexander Meiklejohn, former president of Amherst College. President, Glenn Frank, Litt.D., LL.D.

WISSLER, CLARK (1870-). An American anthropologist (see Vol. XXIII). He became professor of anthropology at Yale in 1924. In 1929 he was elected a member of the National Academy of Sciences. His most recent works are *Riding Gear of the North American Indian* (1914); *Costumes of the Plains Indians* (1914); *Harpoons and Darts of the Stefansson Collection* (1916); *General Discussion of the Shamanistic and Dancing Societies* (1916); *The Sun Dance of the Blackfoot Indian* (1917); *The American Indian* (1917); *Archæology of the Arctic Eskimo* (1918); *Indian Bead Work* (1919); *The American Indian: An Introduction to the Anthropology of the New World* (1922); *Man and Culture* (1923).

WISTER, OWEN (1860-). An American author (see Vol. XXIII). In 1929 Mr. Wister received the Roosevelt Medal for Distinguished Service, in recognition of his work as a historian of the West. His later works include *The Ancient Grudge, or A Straight Deal* (1920); *Indispensable Information for Infants* (1921); *Neighbors Henceforth* (1922); *Watch Your Thirst* (1923); and *When West Was West* (1928). A definitive edition of his writings appeared in 1928.

WITHERS, HARTLEY (1867-). A British economist (see Vol. XXIII). He was editor of the *London Economist* (1916-21) and of the financial supplement of the *Saturday Review* (1921-23). His publications include *International Finance* (1916); *Our Money and the State* (1917); *Business of Finance* (1918); *War-time Finance Problems* (1919); *The Case for Capitalism* (1920); *Bankers and Credit* (1924); *Hints about Investments* (1926); and *Money* (1927).

WODEHOUSE, PELHAM GRENVILLE (1881-). A British author who was educated at Dulwich College and then went into journalism as editor of the "By the Way" column in the *Globe* (1903-09). He became known as a delightfully humorous novelist. Much of his writing was done in the United States. His many books include *The Pothunters* (1902); *Love Among the Chickens* (1906); *Psmith in the City* (1910); *The Little Nugget* (1912); *Psmith, Journalist* (1914); *A Damsel in Distress* (1919); *Indiscretions of Archie* (1921); *Leave It to Psmith* (1923); *The Inimitable Jeeves* (1924); *Carry on, Jeeves* (1925); *Sam the Sudden* (1925); *The Heart of a Goof* (1926); *The Small Bachelor* (1927); *Money for Nothing* (1928); *Fish preferred* (1929). He also wrote *Good Morning, Bill*, a comedy which was produced in 1927 and published in 1928, and he was part author and writer of lyrics for 18 musical comedies, produced mostly in America.

WOESTIJNE, KAREL VAN DE (1878-1929). A Belgian poet, born in Ghent, who became professor of the Flemish language at the University

there. He was a member of the Royal Flemish Academy. His first noteworthy poem, *Chromos*, published when he was sixteen years old, attracted immediate attention. Before he was twenty, he had published other volumes of poetry, in English translation, *The Father's House*, *The Orchard of Birds and Fruits*; *The Golden Shadow*, *Interludes* (1912); *The Man of Mody*; *Substrata*, and *Backwards Sun*. His prose works include several books of essays and criticism, a study of primitive Flemish painters, and the novels, *Janus Bifrons*, *The Continual Presence*, *Divine Images* and an epistolary novel written in collaboration with Herman Terlinck.

WOJIECHOWSKI, STANISLAS (1869-). A President of Poland. Exiled as a young man for protesting against Russian oppression, he went to Geneva, Paris, and London, and when he returned to Poland in 1904, definitely broke with international socialism and threw all his efforts into the cooperative movement. When the World War began, he urged a united stand against Germany. Driven from Warsaw by the Austro-German invasion, he helped form the Polish Legion in France, and in 1919 he returned to Poland and was made Foreign Minister under Paderewski. He was President of Poland from Dec. 20, 1922, until Pilsudski's *coup d'état* of May, 1926, when he resigned his office and retired from Warsaw.

WOLFE, HUMBERT (1885-). A British poet, who was educated at Bradford Grammar School and Wadham College, Oxford. He served as principal assistant secretary to the Ministry of Labor and substitute British government member of the governing board of the International Labor Office. In 1918 he was made a Commander of the Order of the British Empire and in 1925, a Companion of the Bath. His poems included *London Sonnets*, *Circular Sails* (1923); *The Unknown Goddess* (1925); *Humoresque*, *News of the Devil* (1926); *Requiem*, *Lampoons*, and *Kensington Gardens* (1927), and *Cursory Rhymes and Dialogues and Monologues* (1928). He edited the *Augustan Books of English Poetry*, 2d series (since 1927) and wrote *Labour Supply and Regulation*, published by the Carnegie Endowment for International Peace (1923).

WOLFF, völf, ALBERT (1884-). A French conductor and composer, born at Paris. In 1898 he entered the Conservatoire, where his teachers were Leroux, Vidal, and Gédalge. He began his career as organist at St. Thomas d'Aquin (1907-11). In 1911 he was appointed second conductor at the Opéra Comique and of the Concerts Rouges and, in the following year, also conducted the orchestra of the Cercle International at Vichy. Until the outbreak of the World War, he appeared as guest-conductor in several cities of France and in Buenos Aires. During the War, he served in the French Army. After the Armistice, he returned to his post at the Opéra Comique. From 1919 to 1923, he was conductor of the French repertoire at the Metropolitan Opera House from which he resigned because of the demands made on his time by his duties at the Opéra Comique, where, in 1920, he had been appointed Messenger's successor as first conductor and general musical director. In 1924 he resigned and accepted a similar position at the Théâtre des Champs Élysées, but returned the following year to the Opéra Comique. In 1928 he succeeded Paray as conductor of the Lamoureux Orchestra. He wrote the operas, *Le Marchand de Masques* (Nice, 1904), *L'Oiseau*

Bleu (New York, 1919), and *Sœur Béatrice* (not produced); a ballet, *Kilidja*; a symphonic poem; and a violin sonata.

WOMAN SUFFRAGE. In almost no other movement was the influence of the War so decisively effective as in the struggle for woman suffrage. There was a striking advance between 1914, when the political franchise was exercised by women in only four countries, and 1918, when full suffrage had been granted them in Austria, Canada, Czechoslovakia, Denmark, Finland, Germany, Holland, Hungary, Iceland, Ireland, Norway, Poland, Serbia, Sweden, and the United Kingdom. In general, the new countries created by the War incorporated woman suffrage in their constitutions, as in Palestine and the Ukraine, and the Baltic states. In the Covenant of the League of Nations, there was a clause making women eligible for all appointments under it.

In 1924 Spain granted the municipal franchise and eligibility to single women, widows, and female heads of families over 23. In 1928 Great Britain finally extended the franchise to all women 21 years and over. By 1928, in addition to the countries listed above, women had the full franchise in Australia, New Zealand, Russia, the United States, and Great Britain. In 41 other countries, women had a limited franchise and went to the polls. The fact is, on the Continent of Europe, only in France and Switzerland were the women denied some form of the franchise. During the second half of the period under survey, the woman's movement shifted its emphasis from merely political equality to complete legal equality between the sexes. Women's organizations, however, were not united in their aims. With the gaining of the franchise, in most countries a schism developed in which the right wing took up the support of a social reform programme in which peace was the outstanding objective; the left wing, on the other hand, concentrated its efforts entirely on the single goal of equality.

In the United States, the aims of the left wing have been militantly advocated by the National Women's Party which has sought the passage of a constitutional amendment giving women complete equality free of every "distinction, restriction, prohibition, or permission" based upon sex. Unfortunately, the party has become identified in the public eye with an effort to eliminate from the statute books all legislation giving women in industry special protection, and for this reason it has been the target of much effective criticism. It was pointed out in 1928 by the Federal Women's Bureau that the chief argument of the National Women's Party is not true, viz., that as a result of protective legislation women are discriminated against by employers. (See *WOMEN IN INDUSTRY*.) On the other hand, the National League of Women Voters has found a secure place for itself in the political life of the country by studying and advocating programmes of social reform. The organization in 1929 had branches in 44 States and in three-fourths of the congressional districts. The six standing committees of the league indicate the catholic character of its interests. legal status of women, child welfare, women in industry, education, living costs, social hygiene.

United States. Although presumably the first expression of the desire of women for the franchise was made in the United States, the country was among the last to grant woman suffrage, in 1920, after 70 years' agitation. The campaign for the ballot for women had latterly

been carried on along two lines: one aiming to secure State action, the other to put through a Federal amendment. By 1914 full suffrage had been granted by 12 States and Territories: Wyoming, 1869; Colorado, 1893; Utah and Idaho, 1896; Washington, 1910; California, 1911; Arizona, Kansas, and Oregon, 1912; Alaska, 1913; Montana and Nevada, 1914. In 1915, it was estimated that about 4,000,000 women in the United States were eligible to vote. By 1920, at the time the Federal amendment passed, full suffrage had already been won in 15 States (New York, 1917; Michigan, Oklahoma, and South Dakota, 1918), presidential suffrage in 13, the vote in primary elections in 2, and municipal suffrage in a few others. The effort to secure Federal action had met with less encouragement. In 1913 a National woman-suffrage-amendment resolution was defeated on the ground that the question was a State, not a National, issue. This was followed by mass meetings and parades in protest, petitions to Congress, delegations to the President, and a nation-wide demonstration. The movement made evident progress in the next few years. Whereas, in 1912 Roosevelt had been the first important presidential candidate to support it, by 1916 all the presidential candidates had declared for woman suffrage, although the Democratic Party did not favor Federal action in the matter. In 1918 the same Federal amendment which, in substance, had been 12 times before Congress since 1878 and four times since 1913, came within two votes of passage by the Senate, but even President Wilson's plea for it as a war measure could not bring about the necessary two-thirds' vote. In 1919, however, its passage was finally achieved; by Mar. 22, 1920, 35 States had ratified; and the amendment, now being hastened by both Republican and Democratic parties, came into force, with the ratification of Tennessee in August, in time for women to take part in the presidential election of that fall.

It was not possible to measure the results of this extension of the franchise. As a rule, the proportion of eligible women who voted was smaller than that of the eligible men. The women's vote was recognized as an active menace to vice and the liquor interests; it was given credit in large measure for such achievements as the passage of the Federal act giving equal rights of citizenship to married women; it was credited with having rallied to the support of the Eighteenth Amendment and having aided in the election of Herbert Hoover in the presidential campaign of 1928; and its influence was felt in the increasing volume of welfare legislation throughout the States.

By the end of 1928, the presence of women in politics was no novelty. Important places were reserved for them in the counsels of both the major parties, a woman was one of the chief strategists of the Smith campaign; a woman held the office of Assistant Attorney General in the Coolidge administration; in 1928, four women were elected to the Lower House of the National Congress. During 1927 there were 122 women legislators in 34 States and senators in 11 States. Women, as women, however, accounted for no distinct change in the complexion of our political life; they accepted party loyalties as faithfully as did the men, found no difficulty in fitting into the system of "boss" government characteristic of all the cities, and showed, too, that they were not beyond fraud and corruption while in office. (In 1928, for example, a New York State

jury found the former woman Secretary of State Mrs. Florence E. Knapp, guilty of corruption in connection with the administration of the State census.) In other words, the enfranchisement of women seemed to indicate that the only real result was a doubling of the number of persons eligible to vote.

Other Countries. In England, after the succession of the unsympathetic Premier Asquith in 1908, sensational violence and vandalism had been resorted to by the militant wing of the woman-suffrage movement, in an effort to overcome public apathy. After 1913 the nonmilitant suffragists had thrown their influence solidly to the sympathetic Labor Party, in the endeavors to undermine the Asquith government. Between the two forces, the woman-suffrage issue had achieved great prominence. On the outbreak of the War, however, all obstructionist tactics were immediately forsworn by the women of both followings, in favor of prompt and full cooperation with the Government. This action and the part that women subsequently played in both administration and industry, during the emergency, quickly converted even those most hostile to the cause of political equality. It was not, however, until 1918 that the Representation of People Act was passed; and then, in order to preserve a majority of male voters, the franchise was granted only to women at least 30 years of age. Some acceleration in welfare legislation became evident thereafter and, through the Women's Freedom League, efforts were pledged to gain certain legal equalities, but, in the 10 years following, the main emphasis continued to be upon the extension of the franchise to all women 21 years and over.

The Ramsay Macdonald Labor government pledged its support to the extension, but was unseated before it could introduce a franchise measure. The Conservative government under Stanley Baldwin resisted all efforts of the National Suffrage Association until 1927, then finally, on April 13, the Premier announced that his Government at the next session of Parliament would introduce a bill to give the vote to all women 21 years and over on the same terms as those possessed by men. On Mar. 29, 1928, by a vote of 387 to 10, the House of Commons passed the Women's Franchise Bill through its second reading and in this fashion gave its approval for the enfranchisement of approximately 5,000,000 women. By its passage, 14,500,000 women could vote in Great Britain, thus outnumbering the male voters by approximately two millions.

In Canada, where there had already been some extension of the privilege, except in Quebec, and full suffrage in the three prairie provinces from 1916, the Dominion government granted the full franchise in 1917 to women who had near relatives at the front, then, in 1918, to all women who had reached the age of 21. In Australia, where full parliamentary suffrage was granted by the Federal government in 1902, there were 1,100,000 women voters in 1916; but although eligible to both Federal Houses, women were entitled to sit in the state Houses of only South Australia and Queensland. In New Zealand, where full suffrage dated from 1893, about 300,000 women possessed the ballot in 1916 and used it in nearly the same relative proportion as men; they were eligible to all offices except seats in Parliament.

Finland, the first division in Europe to grant actual full political enfranchisement to women (1906), had 24 women in its Diet in 1917. Nor-

way established full suffrage and eligibility in 1913 Iceland in 1914 granted the suffrage to women 40 years of age and over; in 1924 suffrage was universal at 25 years. The limited woman's franchise in Denmark was extended in 1915 to equal suffrage. The women of Holland, enfranchised in 1919 and voting for the first time in 1922, sent seven women to the Parliament of 100 members. After the provisional Government established in Germany in 1918 granted universal suffrage at the age of 20 years, 40 women were elected to the National Assembly, which incorporated adult suffrage in the new constitution. In Italy, a suffrage bill passed the Chamber of Deputies in 1923 but was opposed by Mussolini, who, however, approved a bill granting women municipal suffrage. With the defeat of a woman-suffrage bill in the Senate in 1922, the issue was shelved in France.

WOMEN IN INDUSTRY. The twentieth century has seen a revolution taking place with respect to the entrance of women into industry. In the United States in 1870, of all gainfully employed workers 16 years and over, women made up only 14 per cent (1,645,188 out of 11,766,759). In 1880 the proportion of women was 14.5 per cent (2,353,988 out of 16,273,743). In 1890 the proportion of women in industry was 16.5 per cent (3,596,615 out of 21,814,412). In 1900 the proportion was 17.7 per cent (4,833,630 out of 27,323,055). In 1910 the proportion was 20.6 per cent (7,438,686 out of 36,177,111). In 1920 the proportion was 20.2 per cent (8,202,901 out of 40,553,390). The careful researches of Joseph A. Hill in the U. S. Census Monograph *Women in Gainful Occupations, 1870 to 1920*, have shown that out of the 34,241,749 women in the country 16 years of age and over in 1920, fully 24 per cent were engaged in gainful occupations. Of the rest, 65.7 per cent were housekeepers without gainful occupations, 4.2 per cent were attending schools or colleges, and 6.1 per cent were in all other groups. While this was the distribution for the whole country, in the large cities a greater proportion of the women 16 years and over was gainfully employed. In most cities of over 100,000 population, the proportion was usually in the neighborhood of one-third. In New York, the percentage of women in gainful occupations was 34.2 per cent; in Chicago, it was 32.3 per cent; in Philadelphia, 32.2 per cent; in St. Louis, 33.0 per cent; in Baltimore, 33.5 per cent; in San Francisco, 33.2 per cent; in Boston, 37.2 per cent. In the mill towns of New England, the percentages were high. In Fall River, for example, the proportion was 45.7 per cent and in New Bedford it was 46.1 per cent. Among the various racial and nativity groups, there were to be found marked differences. Of the native white women of native parentage, the proportion was 20 per cent gainfully employed; of the group one or both of whose parents were foreign born, the proportion was 29.2 per cent; of the white immigrant group, the proportion was 18.8 per cent; among Negro women, 43.7 per cent.

The census of 1910 recorded 7,438,686 women, 16 years of age and over, out of the total of 29,188,575 in these groups as being gainfully employed, or 25.6 per cent. In the 1920 census, the figure was 8,202,901 out of 34,241,749, or 24 per cent. This would apparently show a decline. It is, however, to be explained by the fact that the change of the time of enumeration from the spring to the winter and the change in the instructions given to the enumerators resulted in

a marked falling off in the number of women engaged in agriculture. Thus, in 1910, 1,397,324 women were reported to be in agriculture, or 4.8 per cent of the total. In 1920 the number was 896,057, or 2.6 per cent. In other words, the proportion of women in nonagricultural pursuits rose somewhat over the period 1910-20. In 1910, there were 6,041,362 (20.7 per cent) women working in industry; in 1920 the number was 7,306,844 (21.3 per cent). There were other factors affecting the situation. Mr. Hill, in the monograph above cited, shows that with the stoppage of immigration following the war, the American population became an older group and therefore the number of younger women in industry was smaller than in the previous decade. Another important change over the period 1910-20 was the decline in the number of women employed in five important occupations, viz., servants, dressmakers and seamstresses, (not in factories), laundresses (not in laundries), milliners and millinery dealers, boarding- and lodging-house keepers. The total number of women engaged in these five occupations decreased from 2,458,737 in 1910 to 1,785,036 in 1920. Thus, if the figures are corrected further, we find these significant conclusions "The percentage of women employed in nonagricultural pursuits exclusive of the five occupations above mentioned increased from 12.3 per cent in 1910 to 16.1 per cent in 1920. . . . The conclusion seems to be justified that, if agricultural pursuits (for which the census figures are misleading) and the five occupations (from which women are apparently turning away) are left out of account, the movement of women into other gainful occupations—commercial, clerical, industrial, and professional—underwent no check or retardation in the last decade. On the contrary, when due allowance is made for the changes noted in age composition, it seems probable that the increase in the tendency for women to engage in gainful occupations, outside of those above excluded, was greater between 1920 and 1910 than in the preceding decade" (Hill).

It must be understood that the place of women in industry, because of its comparatively recent development, has not reached a position of equilibrium. To a large extent, women are restricted by their education, training, abilities, opportunities, and, sometimes, by temporary conditions as in the case of the use of women in war-time activities. The War, for a time, served to draw women into work in unusual numbers and often in unusual capacities. Whether it was the War, or the mechanization of industry, or the higher standards of living that introduced more and more women into certain types of industry, the fact remains that over the decade 1910-20 there were great changes in the types of employment women were going into. The nonagricultural occupations to show the greatest numerical increases were the following: clerks (except clerks in stores) from 119,385 to 463,570, an increase of 288.3 per cent, semiskilled operatives, manufacturing, from 955,423 to 1,274,719, an increase of 33.4 per cent; stenographers and typists, from 261,202 to 559,748, an increase of 114.3 per cent; bookkeepers, cashiers, and accountants, from 185,209 to 356,003, an increase of 92.4 per cent; saleswomen and clerks in stores, from 350,723 to 514,056, an increase of 46.6 per cent; school teachers, from 476,661 to 635,207, and increase of 33.3 per cent; telephone operators, from 86,081 to 175,469, an increase of 103.8 per cent; laborers in

manufacturing, from 80,048 to 160,133, an increase of 100 per cent; trained nurses, from 76,481 to 143,664, an increase of 87.8 per cent; waitresses, from 83,597 to 114,718, an increase of 37.2 per cent.

Other interesting increases were to be found in the following pursuits: religious, charity, and welfare workers, from 8877 to 26,927, an increase of 203.3 per cent; college presidents and professors, from 2958 to 10,075, an increase of 240.6 per cent; manufacturers and officials in manufacturing, from 6161 to 13,270, an increase of 115.5 per cent. The outstanding decrease over the decade was the falling off of the number of women working as servants. In 1910 there were 1,234,758 women working in this pursuit; in 1920 the number had declined to 981,557, a decrease of 20.5 per cent. In addition to the other four occupations cited above in which decreases were to be found, the following pursuits showed losses, chamberwomen and cleaners, composers and type-setters, and musicians and teachers of music.

It is of interest to note the great increase of women in professional activities. The percentage of teachers increased, for example, from 5.8 per cent of all the women workers in nonagricultural pursuits in 1870 to 8.7 per cent in 1920. Taking females 10 years of age and over in nonagricultural pursuits, the following proportions were to be found in the professions over the period 1870-1920: 1870, 6.4 per cent; 1880, 8.5 per cent; 1890, 9.5 per cent; 1900, 10.0 per cent; 1910, 11.6 per cent; 1920, 13.3 per cent. The following figures show the number of women in the principal professions for 1870, 1910 and 1920: actresses, 692, 11,992, 13,237; architects, designers, inventors, 14, 3,130, 7,340; artists, etc., 412, 15,429, 14,617; clergymen, 67, 9,574, 28,714; dentists, 24, 1,254, 1,829; editors and reporters, 35, 4,181, 5,730; lawyers, 5, 1,343, 3,221; literary and scientific persons; 159, 13,521, 25,205; musicians and teachers of music, 5,753, 84,478, 72,678; photographers, 228, 4,964, 7,119; physicians, surgeons, etc., 527, 13,687, 16,784; teachers and professors in college, etc., 84,047, 484,115, 652,500.

Within the manufacturing and mechanical industries, increases of more than 10,000 women since 1910 were found among semi-skilled operatives in the food, iron and steel, and clothing industries, in silk and knitting mills, and in electrical supply, shoe, cigar, and tobacco factories; among laborers in cotton mills; and among forewomen and overseers in manufacturing. The changes in the rate of increase or decrease for the two sexes were entirely disproportionate, and in far the greater number of cases the women took the lead in the rate of increase. It was significant that while women operatives in automobile factories increased 1408 per cent (from 848 in 1910 to 12,788 in 1920), the largest percentage increase for women in any one industry, men operatives in automobile factories increased only 435.4 per cent, from 20,243 in 1910 to 108,376 in 1920. Although the number of married women, 16 years of age and over, at work, rose from 1,890,061 in 1910 to 1,920,281 in 1920, this group constituted in the latter year only 9 per cent of total number of women and 23 per cent of the number of women in this age group at work, as compared with 10.7 per cent and 24.7 per cent, respectively, in 1910.

If we eliminate the women in agricultural pursuits, we get a slightly different result. The fact is, the percentage of married women who

were employed in nonagricultural activities increased from 3.3 per cent in 1890, to 3.9 per cent in 1900, 6.8 per cent in 1910, and 7.3 per cent in 1920. The proportions of married women to total women in nonagricultural pursuits increased over the same period as follows: in 1890, 12.1 per cent of all the women at work in nonagricultural pursuits were married women; in 1900 the proportion was 13.3 per cent; in 1910, it was 19.8 per cent, in 1920, it was 21.2 per cent.

These census figures show the following: that from two-thirds to three-fourths of the total number of married women at work are following a gainful occupation that takes them away from their homes and their families. Similarly, they are going into the factories, stores and offices in increasing numbers and away from domestic activities. A special effort was made to show the family relationship of working women in a group of cities. Of the total of 373,204 women 16 years of age and over in gainful occupations, the following were the distributions by the individual family relationships: 78.6 per cent were living at home, 13.5 per cent were boarding or lodging, 8.0 per cent were living with their employers. Of those living at home, the following were the distributions in terms of the total working group: head of family, 15.2 per cent; living with father, 25.8 per cent; living with mother, 11.9 per cent, with husband, 14.3 per cent; with other relative, 11.4 per cent.

Nearly 40 per cent of the 8,202,901 women 16 years of age gainfully employed in 1920 were under 25 years of age. For men gainfully employed, the corresponding figure was 20.6 per cent. This is largely to be explained by the fact that in the older age groups, the women are the homemakers and that over 90 per cent of the women married do not follow a gainful occupation. Of the women 18 and 19 years of age, 42.3 per cent are working, in the age group 20 to 24 years, the proportion at work is 38.1 per cent; in the age group 25 to 44 years, the proportion is 22.4 per cent, in the age group 45 to 64 years, the proportion is 17.1 per cent. We may further analyze the number of married women at work in 1920, by age groups. Of the married women 16 to 19 years, 12.7 per cent were working; of the married women 20 to 24 years, 11.4 per cent were working, of the married women 25 to 34 years, 9.7 per cent were working; of the married women 35 to 44 years, 9.5 per cent were working; of the married women 45 years and over, 6.6 per cent were working. Of the total number of women 16 years of age and over in 1920, 19.4 per cent were neither married nor gainfully employed. There were 6,653,030 women in this group. Of this group, 1,900,168 or 28.6 per cent, were young women between 16 and 20 years of age; 2,933,974, or 44.1 per cent were women past 45 years of age, and of these probably 75 per cent were widows or divorced women.

As a result of all this, it was inevitable that the problems presented by women in industry should receive public attention. Minimum-wage laws were passed (see MINIMUM WAGE); the Federal government concerned itself particularly with the protection of the mother (see MATERNITY PROTECTION); and the States passed bills giving mothers' pensions to those women who were deprived of the support of the male breadwinner (see MOTHERS' PENSIONS). Special legislation, greatly influenced by the investigations carried on by the Federal Women's Bureau, made their appearance on the statute books. At the end of

1928, for example, the following efforts had been made to restrict the *hours of work* of women: A maximum working day and week was fixed in 43 States. The 48-hour week was observed in 15 States; in 12 States, the law required an 8-hour day, in 2 States an 8½-hour day, and in 1 State (New York) a 9-hour day. In 13 States, the laws called for the observance of a 54-hour week and a 9-hour working day. In 14 States, the working day was fixed at 10 hours; in New Hampshire, it was 10¼ hours; in Vermont and Tennessee, it was 10½ hours; and in North Carolina, it was 11 hours. In only 16 States was night work forbidden by law and, even here, the laws were not all-inclusive. In Indiana, Massachusetts, and Pennsylvania, the acts covered only manufacturing; in South Carolina, only stores were affected; in Maryland and New Hampshire, night work was prohibited during the hours of 10 P. M. and 6 A. M.; Massachusetts forbade textile work during the hours from 6 P. M. to 6 A. M.

Some of the States had taken measures to prevent women from being employed in *dangerous occupations*. In 17 States, women were forbidden to work in and around mines; lead work was prohibited in Pennsylvania and New Jersey; work with abrasives was prohibited in New York and Ohio; oiling moving machinery was prohibited in Louisiana, Minnesota, Missouri, and West Virginia; the lifting of heavy weights was prohibited by the States of California, Massachusetts, Minnesota, New York, Ohio, and Pennsylvania. The Ohio law of 1919 was the only one with an extensive list of prohibited occupations and the Wisconsin law of 1923 gave the State's industrial commission power to ban any job which might affect the welfare of a woman worker. The fact is, such advances as did take place in the protection of the women industrial workers were largely in the Northern States. In surveys made by the Women's Bureau, it was established that from 34 to 68 per cent of women at work in Northern States were employed 48 hours or less per week. On the other hand, in the nine Southern States of Mississippi, Alabama, Georgia, South Carolina, Virginia, Maryland, Kentucky, Tennessee, and Arkansas, the range was from 1 per cent (Georgia) to 21 per cent (Arkansas).

In contemplating the efforts being made in this direction, the question then naturally arose, Has protective legislation helped or harmed the status of woman in industry? The Woman's Bureau in 1928 published a voluminous report after three years of inquiry, and, as a result of the study made in a group of industries in a number of States, found that such legislation was regarded with favor. In all, a total of 1661 establishments in 179 towns in 11 States employing 665,000 women was examined. The industries covered were these five: boots and shoes, hosiery, paper boxes, electrical products, and clothing. The bureau's findings with regard to the effect of a shorter working day for women on their possibilities for employment were as follows: "The general attitude of the present-day manager in industry . . . shows that the adoption of the shorter-day standard is an almost universal development. . . . The enforced or voluntary shortening of hours for women seems to have brought with it in most instances a similar decrease for men; but whether or not they have been shared by men, there is absolutely no indication in any of the establishments studied that the shorter-hour schedules have been in any way a handicap for women."

Nowhere has a minimum-hour law led to the preference of men over women, even in the case of restaurant workers. Where men were given preference, the reasons lay outside the law, i.e., that high-class restaurants demanded men, that men should have first chance at the jobs where the tips were higher, etc. In the cases of those industries where women were dropped out, the causes were not due to restrictive legislation but to the fact that women were fundamentally unsuited for the jobs. This was true of women car conductors, taxi drivers, metal workers, etc.

Latterly, an interesting phase of public sentiment became observable. A group of women, active in the equal-rights movement in America, and objecting to certain existing legal discriminations against women because of sex, advocated a constitutional amendment to take the following form: "Men and women shall have equal rights throughout the United States and every place subject to its jurisdiction. Congress shall have power to enforce this article by appropriate legislation." On the other hand, another large group of women, comprising almost every organization of workingwomen and of women concerned with improving industrial conditions in the United States, although they were deeply interested in the question of equal rights and recognized the need of abolishing unjust legal discriminations against women, objected to the proposed amendment on the score that it was ambiguous and likely to jeopardize those labor laws for women enacted during the preceding 70 years in the various States and regulating to some extent conditions of employment for approximately 4,000,000 women. The proponents of the amendment argued that special labor laws for women curtailed their opportunities, but the opponents maintained that actual information concerning women in industry disproved such a theory and that special legislation to control standards of women's employment was essential in the interest of the race because they had always been in a weaker position economically than men.

An important outgrowth of the War was the Women's Bureau of the Department of Labor, created as the Woman in Industry Service in 1918 and made permanent in 1920. This bureau, which represents and advises the Secretary of Labor in all matters concerning women in industry, did much to clarify the situation and to organize efforts toward improvement. It conducted various general investigations of women's hours, working conditions, and prevailing wages, of women as an economic factor in the home, and of the social bearing of the "living wage"; carried on research work; made special studies of the census, of domestic service, of industrial accidents among women, and of special industries; and through monthly bulletins or correspondence developed as a clearing house for ideas and experiences in regard to wage-earning women.

During the period of its operation, the bureau has issued 64 of these studies. The following are the standards it has been working for in the interests of women in industry, on behalf of both health and efficiency: "The 8-hour day, Saturday half-holiday, one day of rest in seven, adequate time allowance for meals, rest period at stated intervals, prohibition of night work; a living wage without discrimination because of sex; clean workrooms, lighting without glare, adequate ventilation, cool and accessible drinking water; washing facilities with hot and cold water, soap and individual towels; an adequate number of

clean and accessible toilets; cloak rooms; lunch rooms and rest rooms; careful protection from machinery risks and from danger of fire, exposure to dirt, fumes, and other occupational hazards; prohibition of home work."

WOMEN'S CHRISTIAN TEMPERANCE UNION, NATIONAL This body was organized in 1874 for the purpose of abolishing the legalized liquor traffic, and since the passage of the Eighteenth Amendment, it has continued its policy of agitation and education against the consumption of liquor. To celebrate its fiftieth anniversary, the National W. C. T. U. raised a jubilee fund of \$1,000,000 which was to be used for the promotion of special departments of the organization's work, such as the Americanization of foreign-speaking women, the promotion of child welfare, social morality and the education of the public, especially children, on the scientific truths concerning alcohol. Following the World's W. C. T. U. Convention at London in 1920, Miss Anna Gordon, president of the National W. C. T. U., 1914-25, made a survey of the European countries in the interest of that movement, subsequently going to South America in 1921, and to Mexico in 1922. Miss Gordon was elected president of the World's W. C. T. U. in 1925. Mrs. Ella A. Boole taking her place in the National organization. Immediately following the election of Herbert Hoover as President in 1928, the National W. C. T. U. and its Young People's Branch organized the Youth's Roll Call to enlist young people in a movement to abstain from liquor drinking and to support President Hoover in his law-enforcement policies. At the fifty-fifth annual convention held at Indianapolis, Ind., in 1929, the union presented to the State of Indiana a bronze tablet, to be placed in the State Capitol, in honor of Frances E. Willard, one of the founders of the organization. In addition to its extensive temperance literature, the National W. C. T. U. publishes the *Union Signal*, and the *Young Crusader*. Headquarters are at Evanston, Ill., and Mrs. Lenna Lowe Yost, legislative director of the Department of Legislation maintains offices in Washington, D. C.

WOMEN'S CLUBS, GENERAL FEDERATION OF. An organization established in 1889 for the purpose of bettering community life, it is composed of local and national clubs in the United States and other countries, numbering approximately 14,000 clubs in 1928. The work of the Federation has been carried on for several years under the following departments: American citizenship; American homes; education, fine arts; international relations, legislation; press and publicity; and public welfare. The Federation has been active in organizing rural and junior clubs, and the work accomplished during the World War is continued by cooperation with veteran soldiers. It attempts to improve motion-picture and radio programmes, and it offers a medical-scholarship loan, and an exchange Pan-American scholarship. In addition to these lines of activity, the Federation, in 1924, undertook the support of the Federal education bill, the child-labor amendment, law enforcement, and the World Court. In 1925 it commenced a survey of American homes, with the idea of furthering the installation of labor-saving devices, and in 1927 it made a survey of adult illiteracy. The *General Federation News* is the official publication. Headquarters are at 1734 N. Street, N. W., Washington, D. C. Mrs. John F. Sippel is president, and Miss Josephine Judkin is manager of the research and club service.

WOOD, CLEMENT (1888-). An American author, born at Tuscaloosa, Ala., and educated at the University of Alabama and Yale University. He began the practice of law at Birmingham, Ala., in 1911. After holding the offices of assistant city attorney and recorder of Birmingham, he came to New York City, taught in the Barnard School for Boys from 1915 to 1920, and was vice principal of the Dwight School, 1920-22. His writings include: *Glad of Earth*, poems (1917); *The Earth Turns South* (1919); *Jehovah* (1920); *Mountain*, a novel (1920); *The Laugher* (1922); *Nigger* (1922); *Poets of America* (1925); *Amy Lovell* (1926); *Outline of Man's Knowledge* (1927); *The Shadow from the Bogus* (1928); *King Henry the Rake* (1929). He received the first prize of the Newark (N. J.) Committee of 100 in 1916 for his poem *The Smithy of God* and a prize for his *Jehovah* in 1919.

WOOD, FRANCIS CARTER (1869-). An American pathologist, director of cancer research at the Crocker Research Laboratory, Columbia University (see VOL. XXIII). He was active in educational campaigns of the American Society for the Control of Cancer and in 1925 received the honorary degree of D.Sc. from Tufts College. His work, *DeLafeld and Prudden's Text-Book of Pathology*, reached its 14th ed. in 1927.

WOOD, LEONARD (1860-1927). An American soldier and administrator (see VOL. XXIII). At the outbreak of the World War, he was given command of the Department of the East, which he held till 1917, and was later transferred to the Southeastern Department. He organized and trained the 89th National Army Division, the 10th Division of the Regular Army, and many special regiments and battalions during 1918-19, and commanded the Central Department headquarters in Chicago from 1919 to 1921. He was appointed Governor General of the Philippine Islands in 1921. In 1923 he was awarded the Roosevelt Medal of Honor "for distinguished service." His administration of the Philippines was marked by an active agitation for independence on the part of native leaders. He wrote *The Military Obligation of Citizenship* (1915); *Universal Military Training* (1917); *Our Military History, Its Facts and Fallacies* (1921).

WOOD ALCOHOL. See CHEMISTRY, APPLIED.

WOODBURY, HELEN SUMNER (1876-). An American writer, born at Sheboygan, Wis., and educated at Wellesley College. For 25 years, she has worked with the American Bureau of Industrial Research. During 1906-07 she investigated equal suffrage in Colorado and in 1913 entered the Children's Bureau of the Department of Labor as an industrial expert; she was assistant chief from 1915 to 1918. She visited New Zealand and Australia in 1919-20. During 1924-26 she was with the Institute of Economics. Her writings include *The White Slave* (1896); *Labor Problems*, with Thomas S. Adams (1905); *Equal Suffrage* (1909); *History of Women in Industry*, vol. ix; *Report on Women and Children in Industry*, United States Labor Bureau (1911); *Child Labor Legislation in the United States*, with Ella A. Merritt (1915); *Administration of Child Labor Laws in Connecticut and in New York*, with Ethel E. Hanks (1915; 1916); *History of Labor in the United States*, with John R. Commons and others (1918); *The Working Children of Boston* (1922); *Standards Appli-*

cable to the Administration of Child Labor Laws (1924).

WOOD MEMORIAL FOR THE ERADICATION OF LEPROSY. See LEPROSY.

WOOD PULP. See PAPER AND WOOD PULP.

WOODRUFF, EDWIN HAMLIN (1862-). An American lawyer and educator, born in Ithaca, N. Y., and educated at Cornell University and its law department. He was admitted to the bar in 1888, and was instructor in English at Cornell from 1888 to 1890, and librarian at the Fiske Library in Florence, Italy, in 1890-91. From 1893 to 1896, he was on the law faculty of Stanford University and from the latter date professor of law at Cornell University (emeritus since 1927). From 1914 to 1921, he was dean of the College of Law at Cornell. He wrote several books in legal subjects.

WOODRUFF, HELEN S. (1880-). An American author, born at Selma, Ala., and educated privately. She first became known by her book, *The Lady of the Lighthouse*, which was a "best seller" in 1913. She gave all the royalties from this story to the New York Association for the Blind; the proceeds from all her books went to charity. She wrote several plays, among them *Hurrah for the Girls* (1918), produced at the Forty-fourth Street Roof Garden, New York City; *Kutty, Kutty, Kutty* (1919); *By Love's Speedometer* (1919). Her stories include *Mis' Beauty* (1912); *Really-Truly Nature Stories* (1913); *The Little House* (1914); *Really-Truly Fairy Stories* (1915); *Mr. Doctor-Man* (1915).

WOODRUFF, LORANDE LOSS (1879-). An American biologist, born in New York City, and educated at Columbia University. He was assistant in biology (1903-04) and instructor (1904-07) at Williams College, and instructor (1907-09), assistant professor (1909-15), and professor of biology (1915-22) at Yale University. Since 1922 he has been professor of protozoology at Yale. He is the author of *Foundations of Biology* (1922; 3d ed., 1927), and published, in collaboration, *Origin and Evolution of the Earth and Its Inhabitants* (1918); *Development of the Sciences* (1923); *Organic Adaptation to Environment* (1924).

WOODS, ALBERT FRED (1866-). An American university president (see Vol. XXIII). From 1917 to 1920, he was executive officer of the Maryland State Board of Agriculture and president of the Maryland State College of Agriculture. He was president of the University of Maryland from 1920 to 1926 and since the latter date has been director of scientific work in the U. S. Department of Agriculture.

WOODS, CYRUS E. (1861-). An American diplomat, born at Clearfield, Pa., and educated at Lafayette College. He began the practice of law in Philadelphia in 1889. He was president of the Pennsylvania State Senate (1905-09), Minister to Portugal (1912-15), and Secretary of the State of Pennsylvania (1915-23), but resigned in June, 1921, on nomination by President Harding as Ambassador to Spain. On Mar. 4, 1923, he was appointed Ambassador to Japan, and was in charge of American Red Cross relief work there following the earthquake disaster of Sept. 1, 1923. He resigned in July, 1924.

WOODWARD, SIR ARTHUR SMITH (1864-). A British geologist (see Vol. XXIII). Until 1924 he was keeper of the Geological Department, British Museum. He was president of the Geological Society from 1914 to 1916 and of

the Linnæan Society (1919-23). In the World War, he served in Macedonia and Bulgaria with the British Saloniki force from 1915 to 1919. He was knighted in 1924.

WOODWARD, FREDERIC (CAMPELL) (1874-). An American lawyer and educator, born at Middletown, N. Y., and educated in law at Cornell University. In 1895 he began the practice of law in New York City. From 1898 to 1902, he was professor of law at Dickinson College, and from the latter date to 1907, he filled the same chair in Northwestern University. From 1907 to 1916, he was professor of law and dean (1908-16) of the law school of Leland Stanford University. In the latter year, he became professor of law at the University of Chicago, where he has been vice president and dean of the faculties since 1926. He was the author of several books on legal subjects. During the World War, he served as major and judge advocate general in the U. S. Army.

WOODWORTH, ROBERT SESSIONS (1869-). An American psychologist (see Vol. XXIII). His books published after 1914 show an attempt to profit by the emphasis of the behavioristic school on external observation, without, however, accepting their metaphysical position. These works include *Dynamic Psychology* (1917); *Psychology, a Study of Mental Life* (1921).

WOOLEN AND WORSTED. See TEXTILE MANUFACTURING.

WOOLF, VIRGINIA (?-). A British novelist. Her works include *The Voyage Out* (1915); *Night and Day* (1919), *Jacob's Room* (1922), *Mrs. Dalloway* (1925), *To the Lighthouse* (1927); and *Orlando, A Biography* (1928). She also published *Monday or Tuesday*, short stories (1921); *Tolstoy's Love Letters*, which she and S. S. Koteliansky translated (1923); and *The Common Reader*, essays (1925).

WOOLLCOTT, ALEXANDER (1887-). An American dramatic critic, born at Phalanx, N. J., and educated at Hamilton College and Columbia University. He joined the staff of the *New York Times* in 1909, becoming dramatic critic in 1914. He was also on the editorial staff of *The Home Sector*. He enlisted in the U. S. Army in 1917 and served in France till May 1, 1919. He was a member of the editorial council of *The Stars and Stripes* and correspondent for that paper at the American front and with the Army of Occupation in Germany. From 1922 to 1925, he was dramatic critic of the *New York Herald*, and since 1925 of the *New York World*. His writings include: *Mrs. Fiske—Her Views on Acting, Actors, and the Problems of the Stage* (1917), *The Command Is Forward* (1919); *Mr. Dickens Goes to the Play* (1923); *Enchanted Aisles* (1924); *The Story of Irving Berlin* (1925); *Going to Pieces* (1928); *Two Gentlemen and a Lady* (1928); and articles in magazines.

WOOLLEY, C. LEONARD (1880-). A British archaeologist. He attended New College, Oxford. In 1905-06 he excavated at Corbridge on the Roman Wall. He was attached to the Eckley B. Coxe, Jr., Expedition to Nubia for the University of Pennsylvania (1907-11) and the Oxford Expedition to Nubia (1911), and took part in the survey of Sinai for the Palestine Exploration Fund in 1914. In the World War, he was in the British Intelligence Service in Egypt (1914-16), was a prisoner in Turkey (1916-18), and a political officer in Northern Syria (1919). After the War, he continued excavations at Carchemish, Tell el Amarna (1922) and, from 1922

to 1928, led the joint expedition of the University of Pennsylvania Museum and the British Museum in excavating on the site of Ur of the Chaldees. He is the author of *Dead Towns and Living Men* (1920) and *The Sumerians* (1929).

WOOSTER, THE COLLEGE OF. A coeducational institution founded at Wooster, Ohio, in 1870. The student body increased in number from 398 in 1918 to 862 in 1927-28, the faculty from 33 to 57 members in the autumn of 1928, and the library from 41,900 to 57,000 volumes. The endowment was increased from \$1,174,780 in 1913 to \$2,843,376 in 1927-28, and the income from \$104,335 to \$432,700. Between 1914 and 1928, a girl's dormitory was erected; Galpin Park was added at the north side of the campus; a large concrete stadium and grandstand were added to the equipment of the athletic field; a college hospital was completed in 1927; a new residence for the president was constructed in 1928, and the conservatory of music was made a department of the college. President, Charles F. Wishart, D.D., LL.D.

WORCESTER, wus'tēr A manufacturing city of Massachusetts and the third largest city of New England. The population increased from 145,986 in 1910, to 179,754 in 1920, to 190,757 in 1925 (State census) and to 197,600 in 1928, by estimate of the U. S. Bureau of the Census. A new reinforced concrete bridge was built between 1916 and 1919 over Lake Quinsigamond at a cost of \$325,000. The city's park system was expanded until in 1928 the total park area was 1126 acres. In 1925 the installation of a new sewage-treatment plant was completed at a cost of \$3,500,000, the Union Station was modernized in 1920, and in 1927 the municipal airport, Whittall Field, was established at North Grafton. In 1927, 30,377 persons were employed by approximately 500 industrial establishments and received \$41,403,603 in wages, the value of products manufactured was \$194,221,808. Bank clearings in 1928 amounted to \$187,941,000. The assessed valuation of property in 1928 was \$346,913,700, the net debt was \$10,826,450.

WORCESTER MUSIC FESTIVAL. See Music, Festivals.

WORCESTER POLYTECHNIC INSTITUTE. A nonsectarian institution at Worcester, Mass., for the education of men in the professions of engineering and chemistry, founded in 1865. The student enrollment in 1915 was 543, as compared with 602 in 1928, the faculty numbered 54 in the former year, as compared with 68 in the latter. In the same period, the library was increased from 14,544 to 23,000 volumes, and the productive funds from \$900,000 to \$2,734,000. A gymnasium was opened in 1916 and courses in business were offered in 1922. In 1926 a hydraulic laboratory, given by George L. Alden, new athletic facilities and a swimming pool, given by Henry J. Fuller, were provided. Sanford Riley Hall, a freshman dormitory, was completed in 1927. President, Ralph Earle, D.Sc., D.Eng., Captain, U. S. Navy (ret.)

WORK, HUBERT (1860-). An American public official, born at Marion Centre, Pa., and educated at the University of Pennsylvania. He began the practice of medicine at Greeley, Colo., in 1885, and in 1896 founded the Woodcroft Hospital for mental and nervous diseases. In 1912 he was chairman of the Colorado Republican State Central Committee and Colorado member of the Republican National Committee. During 1921-22 he was first Assistant Postmaster Gen-

eral of the United States, and in March, 1922, he became Postmaster General. From Mar. 5, 1923, to July, 1928, he was Secretary of the Interior, resigning to become chairman of the Republican National Committee in the presidential campaign that resulted in the election of Herbert Hoover. He resigned this latter post in 1929. He received the appointment of lieutenant colonel in the Medical Corps of the U. S. Army during the World War.

WORKERS' PARTY. See COMMUNISM.

WORKMEN'S COMPENSATION. One of the most significant forms of welfare legislation developed in the United States in the last two decades has been the protection of workmen injured during the course of employment. Undoubtedly, the operations of workmen's compensation laws have been the chief influence in the checking of dependency and in lightening the load placed upon private philanthropy by the laissez-faire principle of our modern industrial society. It is true that American public authority has not matched the progress made by European countries, notably Great Britain, France, Germany, and Russia, in guaranteeing the worker against the insecurities of illness, unemployment, invalidity, and old age. The difficulties of our Federal system, by which such actions are almost entirely relegated to individual State initiative, have stood in the way of uniform progress with the result that in some States the position of the working populations is much less secure than in others, but the outlook is not a hopeless one, for the weakness of the Federal system is its chief strength. We have in the forty-eight States in the Federal Union, in effect, so many laboratories for experimentation with social legislation and the proved success of an idea assures its ultimate adoption in almost every State of the Union. This, certainly, has been the history of workmen's compensation legislation in this country, as it also has been the histories of mothers' assistance acts and old-age pensions. It is entirely within the bounds of reason to expect that, shortly, protection of the workers against unemployment will have its initial trial in one of these social laboratories with the result that another couple of decades will probably see the American working population protected against the most vicious aspect of our modern economic life.

The advances of workmen's-compensation legislation have been rapid. The first law was enacted in 1908, one law was enacted in 1909; one in 1910; ten in 1911, four in 1912; seven in 1913; two in 1914, nine in 1915, one in 1916; five in 1917; one in 1918; four in 1919; one in 1920; two in 1927, one in 1928; one in 1929. There were, at the end of 1929, laws on the statute books of 44 States, the Territories of Alaska and the Philippines, Hawaii and Porto Rico, and by Congressional enactment laws for the protection of the civil employees of the Federal government, workers in the District of Columbia, and men engaged on harbors and wharves. The only States not to enact workmen's-compensation legislation were the following Southern States: Arkansas, Florida, Mississippi, and South Carolina. The last measures to be passed were the Longshoremen's and Harbor-worker's Compensation Act, enacted by Congress, July 1, 1927; the Workmen's-compensation Act of the Philippine Islands, of the same year; the Congressional Act of July 1, 1928, applying to private employees in the District of Columbia; and

the act passed by the legislature of North Dakota during its sessions of 1929. Most European countries likewise have adopted the principle of workmen's compensation, in addition to the social-insurance measures above referred to. None of the American laws undertakes to cover all types of employment. The most important exceptions are those of agriculture and domestic service. Interstate commerce is exempt because it is subject to the action of Congress. It is to be noted

to be made out of a special fund. *Death.* In all but 9 of the States, in addition to compensation, funeral expenses are paid. In 7 States and under the two Federal statutes, the maximum for funeral expenses is \$200. In 21 other States, it is \$150. The widow, in most of the States, gets 35 per cent of the weekly wages until death or remarriage and, for each child under 15 years, there is an allowance of 15 per cent or more. In Alabama, Hawaii, New Mexico, and South Dakota,

NUMBER OF COMPENSATED ACCIDENTS, COMPENSATION PAID, AND TIME LOST, IN NEW YORK STATE, YEAR ENDING JUNE 30, 1927, BY CAUSE

	Number of cases	Time loss (weeks)	Average wks lost per case	Compensation paid	Average amt paid per case
Handling objects	27,692	322,648	11.7	\$4,643,260	\$167.68
Falls	18,092	535,411	29.6	6,515,137	360.11
Machinery	13,026	289,001	22.2	4,411,144	338.64
Vehicles	8,897	362,902	40.8	3,809,666	428.20

Indefinite history of accidents	1,257	18,040	14.4	171,952	136.80
Animals	691	18,492	26.8	207,164	299.80
Total	98,984	2,298,492	23.2	28,186,003	284.75

that in 12 States coverage applies only to hazardous employments. Also, the laws of 23 States exempt the employers whose plants employ less than a stipulated number of employees. The exclusion of agricultural workers is universal in the compensation laws of the United States, with the exception of Hawaii and New Jersey. Domestic service, too, is excluded, except in New Jersey. Exclusion of employees receiving above a designated wage is provided in a few States.

The following were the leading characteristics of workmen's-compensation legislation in the United States: *Waiting time.* All States but Oregon and South Dakota prescribed a period of waiting time before compensation was payable. In five States and in the two Federal acts, the waiting time was less than one week; in 29 States, it was 7 days; in 3 States, it was 10 days; in 4 States, it was 14 days. *Temporary disability.* In 14 States and under the two Federal acts, the worker was allowed 66⅔ per cent of his wages while laid up, in 7 States, the allowance was 65 per cent; in 6 States and Hawaii, the allowance was 60 per cent; in 3 States, it was 55 per cent; in the remaining States, the allowance was 50 per cent. Arizona, Oregon, and Washington set up minimums for allowances for temporary disability, but the other States did not. The minimum allowances ranged from \$3 to \$8 weekly and the maximums ranged from \$12 to \$25 weekly. In 34 States, there was fixed a maximum number of weeks during which payments were allowed. These maximums ranged from 200 to 500 weeks. In Wisconsin, the maximum was 1000 weeks. *Permanent total disability.* For this type of injury, in 15 States and under two Federal acts, the worker is to receive a fractional wage every week. In the other States, the limits for compensation are between 260 and 550 weeks, though in Wisconsin, the limit is 1000 weeks. Money compensation ranges from between \$3000 to \$19,500. *Permanent partial disability.* Special arrangements are made for the loss of a finger, eye, etc. In 10 States and under the Federal Longshoremen's Act, payment for extra disability (second eye, e.g.) is

all alien nonresident dependents are excluded from this type of compensation. *Rehabilitation.* In 1918 the State of Massachusetts made provision for the industrial rehabilitation of injured workmen through surgery, reeducation, etc. In 1919, 9 other States followed suit. In 1920 Congress voted to match dollar for dollar all sums appropriated by the States for this type of work. A total of 41 States was coöperating in 1929.

Occupational diseases. The first American law for the compulsory reporting of occupational diseases was enacted in California in 1911 and by 1916, 16 other States had adopted similar legislation. The original laws called for reports on cases of anthrax, compressed-air illness, and poisoning from lead, phosphorus, arsenic, mercury, brass, and wood alcohol. In recent years, States have begun to write on their statute books laws making injuries from occupational diseases compensable. In 5 States, California, Connecticut, Massachusetts, North Dakota, and Wisconsin, and in Hawaii, as well as under the two Federal acts, all injuries thus sustained, regardless of the disease, are compensable. In another group of States, only listed diseases are considered under the compensation laws. These so-called "specific schedules" are to be found in New York, Illinois, Minnesota, New Jersey, Ohio, and Porto Rico. The 1929 New York Legislature refused to pass a general coverage law, but contented itself with adding four more diseases to its specific schedule. *Insurance.* Insurance of the employer's liability to pay compensation is recognized as an essential feature of the workmen's-compensation statute in most of the States. Self-insurance, insurance through private companies, or by insurance in State funds (exclusive or competitive) is required. Compensation insurance is compulsory in all but 17 States. State fund insurance systems exist in 19 of the States and in seven of these the State funds are monopolistic. These seven States are the following: Nevada, North Dakota, Ohio, Oregon, Washington, West Virginia, and Wyoming. The following are the twelve States where State insurance funds compete with private carriers,

usually at a considerably lower rate: Arizona, California, Colorado, Idaho, Massachusetts, Michigan, Montana, New York, Pennsylvania, Porto Rico, Tennessee, and Utah. The example of the State of Ohio may be cited to indicate the scale of the operations of these State insurance funds. In 1927 the State fund reported assets of \$55,235,407 of which \$46,515,351 was being held as a claim reserve. During the year, the receipts of the fund made up of earned premiums and interest on the claim reserve totaled \$15,457,321 and the disbursements were \$13,358,270. It is interesting to note that this State fund uses a system for giving merit ratings, with savings in premiums to employers, based on the number of accidents occurring in their plants. In New York, in the calendar 1927, the State fund wrote premiums to the total of \$7,088,628, an increase of \$138,856 over the previous year. For 1927 the number of policy-holders totaled 21,047, an increase of 3586. Since 1922, the State funds earned premiums have shown greater increases proportionately than the movement of factory pay rolls for the same period. Unfortunately, State funds are limited in their possibilities of expansion because the most profitable risks, i.e., those of the large establishments, are being covered by self-insurance or what is the same thing, mutual companies. The risks of the small employers of labor are comparatively unprofitable with the result that private companies seek to eliminate these risks wherever possible. In the final resort, State funds, where they operate, are compelled to assume these unprofitable risks. In New York State, for example, in 1924 and 1925, among the group of small plants paying between the \$25 and \$50 premiums, the losses were 89.8 per cent of the earned premiums, while, for the plants paying \$30,000 and over in insurance premiums, the percentage of premiums earned was 52.4 per cent. An outstanding authority in the field, Mr. Ethelbert Stewart, United States Commissioner of Labor Statistics, views the situation with concern and feels that unless action is taken the result will be that the State funds will be handling only the small and unprofitable risks and that in time the State funds may have to be supported from general taxation.

Administration The administration of the laws has been recognized as a technical matter and, in most of the States, agencies have been established. In only Alabama, Alaska, Louisiana, New Hampshire, New Mexico, Tennessee, and Wyoming are the laws administered by the courts. These administrative officials, as early as 1914, banded themselves together into a permanent organization for the discussion of their common problems, and when Canadian provinces began to pass workmen's compensation laws, they, too, were included. The name of this organization is the International Association of Industrial Accident Boards and Commissions and it meets once a year for the purpose of standardizing practices, ways of cutting down accidents, methods of computing industrial accident- and sickness-insurance costs, statistical reporting, and the like.

The table on page 1714 indicates the nature of the accidents, the total number of persons affected, and the amounts paid out for a single year in but one State (New York, for the fiscal year ending June 30, 1927). It must be apparent that despite the fact that compensation protection

places such a high charge upon the operating costs of industry, the reduction of industrial accidents has made but little headway. It was estimated in 1928 that industrial accidents were costing the manufacturers five billion dollars annually. Experts of the National Safety Council declared that 85 per cent of all industrial accidents was preventable if proper safety rules were enforced, and that another 10 per cent was due to improper physical conditions in the plants. It was estimated that annually there was being paid out in the neighborhood of \$150,000,000 by American States for workmen's compensation.

In Great Britain, despite compensation laws, the toll of industrial accidents has been mounting, also. In the following seven important key industries, viz., mines, quarries, docks, railways, construction work, factories, shipping, the total number of accidents rose from 368,469 in 1919 to 458,419 in 1927. Fatal accidents in the earlier year totaled 3293 and in the later year 2567. Despite the smaller group of industrial workers in the country and the lower real wages, the amounts paid out in compensation are staggering, even by American standards. In 1919 compensation awards totaled £4,616,723; in 1927, they totaled £6,315,803. In compensation for occupational diseases, which the English law covers, there was paid out in 1927 £5278 for 25 fatal cases and £548,492 for 17,079 cases of disablement.

WORLD COURT. The popular designation for the Permanent Court of International Justice, a permanent tribunal for the judicial settlement of international disputes, which sits at The Hague. The Court was formally opened Feb. 15, 1922. It was established by the League of Nations under a mandate contained in Article XIV of the Covenant of the League, the enabling statute having been approved by the Assembly of the League on Dec. 13, 1920. See LEAGUE OF NATIONS.

History. The principle of the arbitration of international controversies as a substitute for war was practiced by the Greeks and, in the modern era, as early as 1794, when the Jay Treaty provided for the arbitration of three important disputes between the United States and Great Britain. The Permanent Court of International Justice may be characterized as an important step in the development of an accepted principle, rather than a new departure in international relations. The resort to international arbitration was frequent during the nineteenth century, especially after the settlement of the Alabama Claims dispute between the United States and Great Britain by a tribunal at Geneva in 1872. Growing sentiment in support of the arbitral principle led to the adoption of the Convention for the Pacific Settlement of International Disputes by The Hague Conference of 1899. The convention established the Permanent Court of Arbitration, still functioning at The Hague, regulated the employment of mediation, and provided for the employment of international commissions of inquiry to investigate and report on controverted facts.

The Permanent Court of Arbitration, although it proved valuable in the settlement of a number of important controversies, failed to meet the expectations of many and a demand grew for an international tribunal to which nations would be forced to submit their disputes for settlement in accordance with judicial principles. The United States presented to the Second Peace Conference

at The Hague in 1907 a proposal for the establishment of a permanent "Court of Arbitral Justice," to remain continuously in session, but no action was taken because of difficulty in providing a method for the selection of judges. The World War strengthened the demand for an international trial court and, in Article XIV of the League of Nations Covenant, the Council was instructed to prepare "plans for the establishment of a Permanent Court of International Justice."

An international committee, known as the Advisory Council of Jurists and including the American statesman, Elihu Root, was appointed by the Council to fulfill this mandate. The committee met at The Hague, in June and July, 1920, and submitted to the Council a proposal for a court having compulsory jurisdiction over all members of the League similar to that the Permanent Court now exercises over States which have accepted the optional clause. The proposal was rejected by the Council, the ground being that, in effect, the compulsory jurisdiction provision amended Article XIV of the Covenant, which provided disputants with the alternatives of laying their controversy before the Court, some other international tribunal, or the Council itself. The statute for the establishment of the Permanent Court, therefore, stipulated that the jurisdiction of the Court comprised "all cases which the parties refer to it and all matters specially provided for in treaties and conventions in force." As a compromise, however, the statute also provided that any power might *ipso facto* accept the compulsory jurisdiction of the Court in any or all of the four classes of legal disputes previously enumerated. It was further provided that such acceptance might be conditional upon reciprocity, or unconditional, or for a certain period of time.

Organization of the World Court. The Court held its organization meeting at The Hague on Jan. 30, 1922. B. C. J. Loder of The Hague, was elected president; Charles André Weiss of France, vice president, and A. Hammarskjöld of Sweden, registrar. Formal opening of the Court took place in the Peace Palace of The Hague on Feb. 15, 1922, after which the Court formulated its rules of procedure. Some of the more important problems involved the extent to which the records of the Court should be open to inspection, the giving of advisory opinions, and the position and functions of the deputy judges.

Constitution and Jurisdiction. The constitution, organization, jurisdiction, and procedure of the World Court are determined first, by the statute approved by the Assembly and put into a separate treaty, which previous to October, 1929, had been ratified by 42 of the 54 signatory States; second, by a body of "rules of Court" prepared by the Court under authority of the statute; third, by a number of resolutions of the Council and the Assembly of the League which complete the statute; and fourth, by numerous treaties, conventions, and other international agreements conferring jurisdiction on the Court. In September, 1929, the original statute was amended in some respects by the Council and Assembly of the League. The protocol of the revised statute was signed by representatives of 48 nations during the sessions of the Tenth Assembly.

Previous to September, 1929, the Court consisted of eleven judges and four deputy judges, who served in the absence of judges. The Tenth

Assembly of the League of Nations, however, amended the statute, increasing the number of judges from eleven to fifteen abolishing the deputy judgeships. Judges are elected by the concurrent votes of absolute majorities of the Council and the Assembly of the League, sitting and voting independently, from a list of candidates nominated by the various national groups in the Permanent Court of Arbitration. The term of office is nine years and members are re-eligible. A Judge is irremovable, except by unanimous agreement among the other members of the court that he has ceased to fulfill the required conditions. Where a person is chosen to fill a vacancy, he holds office only for the remainder of the unexpired term. Consequently, there must be an election of the whole Court every nine years. Judges are not permitted to exercise any administrative or political function.

The Court, as a whole, is intended to represent the main forms of civilization and the principal legal systems of the world. Judges are elected regardless of nationality, under the statute, but the election of more than one judge of any particular nationality is forbidden. If one of the judges sitting in a particular case is of the same nationality as one of the litigants, the other litigant has the right to representation in the Court by a judge of his nationality.

The full Court is required to sit except in the following three classes of cases, provided in the statute: (1) cases falling under the Labor Clauses of the Treaty of Versailles (Part XIII) and of the other peace treaties, (2) cases relating to transit and communications, particularly under Part XII of the Treaty of Versailles, and (3) cases which the disputants request be disposed of by summary procedure. To dispose of the first two classes of cases the Court is required to appoint every three years a special chamber of five judges. In all labor cases, whether determined by the full Court or the special chamber, the judges are assisted by four technical assessors, who sit in an advisory capacity but do not vote. With the consent of the parties, the special chambers may sit elsewhere than at The Hague. For the third class of cases, the Court forms annually a chamber of three judges to dispose of disputes by summary procedure.

The one responsible official of the Court is the registrar, who is assisted by a secretariat called the "registry." Both president and registrar must reside at the seat of the Court. Though the Court draws up its own budget, its expenses are met by the constituent states through the League of Nations. In 1924 they amounted to 580,127 Dutch florins (about \$233,000). Each judge receives an annual salary of 15,000 florins (\$6030), in addition to traveling expenses, living expenses while at The Hague, and an allowance of 100 florins a day while on duty. The official languages of the Court are French and English. The tribunal formerly met at least once a year, commencing June 15, and continued in session until the cases on the list were disposed of. This procedure was also changed in September, 1929, and continuous sessions provided for, with the judges acting in rotation.

The Court is competent to hear all cases which states or members of the League of Nations, as contrasted with individuals, may present to it and all matters specially provided for in international treaties and conventions in force. Generally, the legal disputes in which it exercises jurisdiction

concern (1) the interpretation of a treaty, (2) any question of international law, (3) the existence of any fact, which, if established, would constitute a breach of international obligation, (4) the nature or extent of the reparation to be made for the breach of an international obligation. The Court's jurisdiction in the above classes of disputes is compulsory only with regard to states signing the so-called optional clause of the statute, which recognizes the right of one party to summon another before the Court.

The states which in November, 1929, were bound by the optional clause were Abyssinia, Austria, Belgium, Bulgaria, China, Denmark, Estonia, Finland, Germany, Greece, Haiti, Lithuania, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, and Uruguay. States which had signed the optional clause but had not ratified it (October, 1929) were Brazil, Costa Rica, Dominican Republic, France, Guatemala, Hungary, Latvia, Liberia, Luxembourg, Panama, Salvador, Australia, Canada, Czechoslovakia, Great Britain, India, Irish Free State, Italy, New Zealand, Nicaragua, Peru, Siam, and South Africa. In the cases of Brazil, China, Costa Rica, Estonia, Haiti, Lithuania, the Netherlands, Panama, Salvador, Spain, and Sweden, ratifications were not specified as necessary to give the signatures force and were not actually deposited. Costa Rica, Panama, and Salvador signed without condition as to ratification, but had not in October, 1929, ratified the protocol of signature of the statute. Various reservations as to the application of the optional clause were made by some of the states which ratified.

Compulsory jurisdiction is also conferred upon the Court by certain clauses of the peace treaties which ended the World War, by the Locarno Agreements, and by a number of arbitral and other conventions concluded between states since the establishment of the Court.

In disputes affecting states which have not accepted the optional clause, or which are not parties to the above treaties and conventions, the Court makes awards only when a case is voluntarily submitted by both parties involved.

Under Article XIV of the Covenant, the Council or the Assembly of the League of Nations may ask the Court for an advisory opinion on disputes with which they are concerned. Advisory opinions rendered by the Court on such occasions have in practice been confined to the juridical aspect of the dispute. While the Court ordinarily employs strictly judicial procedure, it may also, if requested by the parties, adopt a special procedure *ex aequo et bono*.

The statute provides that the Court, in arriving at its decisions, shall apply (1) international conventions, whether general or particular, establishing rules expressly recognized by the contesting states, (2) international custom, as evidence of a general practice accepted as law, (3) the general principle of law recognized by civilized nations, (4) judicial decisions and the teachings of the most highly qualified publicists of the various nations, as subsidiary means for the determination of rules of law.

The procedure followed in the adjudication of disputes has been altered somewhat from time to time as the experience of the Court dictated. When any case properly coming before the Court is submitted, it is at once circulated to all the states of the world and time limits are fixed for the filing of documents and the opening of the

oral proceedings. The same action is taken with regard to requests for advisory opinions, and in addition international organizations considered to be concerned are notified, and time limits fixed for the filing of written or oral information, if they request permission to do so. When documents have been filed and the cases of the disputants presented orally before a public session of the Court by their respective "agents," the judges meet in private to formulate their decision or opinion. An informal exchange of views on the salient features of the case follows, after which a time limit is fixed within which each judge must file anonymously with the president a note containing his opinion on the case as a whole. The president then circulates to his colleagues a summary of the various opinions, arranged somewhat in the form of a questionnaire.

The Court then determines by lengthy discussion and by successive preliminary votes the majority's solution of each point at issue and the statement of reasons to be given in support of each conclusion. A committee composed of the president, the registrar, and of two judges elected for this specific duty then drafts the decision. The draft is distributed to members of the Court, a time limit being fixed for the presentation of amendments. The committee may or may not revise the draft in accordance with amendments suggested and then submits a final report which is discussed by the full Court, first generally and then paragraph by paragraph. Further revision is sometimes necessary before the report is adopted by a final vote and becomes the judgment or opinion of the Court. If not unanimous, dissenting judges are entitled to deliver separate opinions. The Court construes its judgments, at the request of any party. It may refuse a request for an advisory opinion, as it did in the so-called Eastern Carelian question, when it feels that it has no jurisdiction.

Judges of the Court in 1929 were Dionisio Anzilotti (Italian), president; Max Huber (Swiss), vice president; B. C. J. Loder (Dutch), Sir Cecil Huist (British), Henri Fromageot (French), D. J. Nyholm (Danish), Antonio S. de Bustamante (Cuban), Rafael Altamira (Spanish), Yorozu Oda (Japanese), Epitacio Da Silva Pessoa (Brazilian), Charles E. Hughes (American), Michailo Yovanovitch (Jugoslavian), F. V. N. Beichmann (Norwegian), Demetre Negulesco (Rumanian), and Chung-Hui Wang (Chinese).

Decisions of the World Court. The first case before the Court was a request for an advisory opinion as to the legality of the appointment by the Netherlands government of what was called its Workers' Delegate to the Second International Labor Conference. The opinion, rendered on Aug. 10, 1922, sustained the action of the conference in seating the delegate. It was considered important in that it involved the legal standing of the labor conference under the Versailles Treaty. In a second advisory opinion the same year, the Court overruled the contention of the French government that the International Labor Office was incompetent in matters affecting agriculture under the terms of the Versailles Treaty.

Among other questions submitted to the court for advisory opinions during the first two years of its existence was a dispute between France and Great Britain as to the validity, in an international sense, of decrees issued by the French government in Tunis and in the French zone in

Morocco affecting the nationality of resident foreigners. An opinion rendered on the so-called Eastern Carelian case was an important precedent which later was freely mentioned in the debates in the United States Senate, held in connection with the proposal for American adherence to the Court. The dispute arose over the interpretation of the treaty of peace between Russia and Finland in its application to Eastern Carelia. Finland brought the matter before the Council of the League of Nations. Russia, not being a member of the League, declined to accept its interpretation and the Council finally submitted the dispute to the World Court with a request for an advisory opinion. This the Court declined to render, after Russia had again refused to submit its case, on the ground that without the consent of both parties the Court had no jurisdiction.

The number of disputes submitted to the Court for judicial decision increased as the years passed. Judgments were announced in a dispute between Greece and Bulgaria over the interpretation of the Reparation Clause in the Treaty of Neuilly (1924) and between Germany and Poland over German interests in Upper Silesia. An important advisory opinion in 1926 concerned the interpretation of that section of the Treaty of Lausanne delimiting the Mosul boundary between Turkey and Iraq.

The later important judgments included the case of the *Lotus*, a French ship, which after colliding with a Turkish vessel at sea in 1927, made its way to Constantinople where the authorities arrested the officer of the watch. By a majority of one, the Court rejected a French suit for damages, holding that the laws of a nation may apply beyond its limits unless there is a rule of international law to oppose it. In 1927 three important advisory opinions regarding the powers and jurisdiction of the European Commission of the Danube were issued. A judgment rendered April 26, 1928, dealt with difficult issues concerning the admission of children to the German minority schools in Polish Upper Silesia. During the same year, the Court issued an order denouncing the treaty between China and Belgium of Nov. 2, 1865, and delivered advisory opinions concerning the jurisdiction of the courts of Danzig and interpreting the Greco-Turkish Agreement of Dec. 1, 1926.

Up to 1929, the Court had delivered thirteen judgments and sixteen advisory opinions upon international controversies.

In 1926, 31 of the 75 articles composing the constitution of the Court were revised, the bulk of them dealing with procedure. Among the new rules was a provision that the Court should sit in private when deliberating upon an advisory opinion. In 1927 the rules governing advisory decisions were amended to provide that advisory opinions should be given after deliberation of the full court and that if the opinion sought relates to a dispute between two or more states, each of the parties, if it has no national among the judges of the Court, may appoint one of its nationals to sit as judge *ad hoc*.

A committee of international jurists, appointed by the League of Nations to consider the revision of the statute of the World Court, met in March, 1929. Besides approving the Root formula intended to facilitate the adherence of the United States to the Court, the committee recommended that the number of judges should be increased from 11 to 15, that the four deputy judgeships

be abolished, and that the Court should sit in continuous session, the judges acting in rotation, rather than in annual sessions as now.

The report of the committee of jurists, embodying these recommendations, was accepted by the Council of the League in July, 1929, and by the Tenth Assembly, which met from Sept. 2 to 25, 1929. Forty-eight nations signed the new protocol during the meeting of the Assembly. At the same meeting, the optional clause for the acceptance of the Court's compulsory jurisdiction was signed, with various reservations, by 15 powers, among them Great Britain, France, Italy, Czechoslovakia, and the several British Dominions. With the exception of France, which signed for the second time, and Germany, the great powers had hitherto consistently declined to sign the clause.

An extraordinary session of the Court was held in June, 1929, to consider the so-called gold-franc cases between France and Brazil and France and Yugoslavia, and the Franco-Swiss zone dispute. Charles Evans Hughes, the new American member elected to succeed John Bassett Moore, took his seat for the first time.

The United States and the World Court.

The question of America's adhesion to the World Court protocol has remained an important public issue since the receipt on Aug. 15, 1921, by the Secretary of State of a certified copy of the protocol and accompanying statute from the Secretary General of the League of Nations. President Harding, on Feb. 24, 1923, submitted both protocol and statute to the Senate with a request for its consent to American adhesion with four "conditions and understandings" explained in an attached letter from Secretary of State Hughes. The committee on foreign relations reported the proposal favorably to the Senate on May 26, 1924, but with radical amendments. Before the debate began in the Senate on Dec. 17, 1925, the Court had been endorsed by both party platforms in 1924, and by the House of Representatives on Mar. 3, 1925 (vote of 303 to 28), and America's entrance into the Court had been repeatedly urged by President Harding previous to his death and later by President Coolidge.

On Jan. 27, 1926, the Senate accepted the resolution (76 to 17) approving adherence to the protocol, but with five reservations. The first four of these disavowed the assumption of any obligations under the Treaty of Versailles, gave the United States the right to withdraw, stipulated that the Senate must consent to agreements submitting cases to the Court, and reserved the policies of Washington's Farewell Address and the Monroe Doctrine. The fifth reservation read as follows:

"That the Court shall not render any advisory opinion except publicly after due notice to all States adhering to the Court and to all interested States and after public hearing or opportunity for hearing given to any State concerned; nor shall it, without the consent of the United States, entertain any request for an advisory opinion touching any dispute or question in which the United States has or claims an interest."

Copies of the resolution were forwarded to all signatories of the protocol on March 2, the resolution also having stipulated that the United States should not sign the protocol until all signatory powers had indicated their acceptance of the reservations through an exchange of notes. The reservations proved unacceptable as drawn,

however, and on March 18, the Council of the League adopted the suggestion of Sir Austen Chamberlain, the British representative, which pointed out the various difficulties raised by the United States reservations, and called a meeting of representatives of all signatory states and of the United States at Geneva to arrange a new agreement satisfactory to all concerned. Secretary of State Kellogg declined the invitation, but 40 of the League members accepted and the conference was held from Sept. 1 to 23, 1926. The conference found no great objection to the first four reservations and the first half of the fifth.

Interpretations placed upon the last half of the fifth reservation varied considerably but fell into three general lines. The first was that the United States wished equality with members of the Council in controlling requests for advisory opinions. This the resolution would ensure in case the Council could only make such requests by unanimous vote. But the constitutional law of the League on this point had not been definitely settled and it was felt that this must be decided before an answer could be given to the United States. In some cases, a majority vote of the Council sufficed to authorize a request for an advisory opinion. The point was raised that in such cases the reservation gave the United States a power greater than that possessed by any member of the Council.

The second point raised in objection to the reservation was that even if the United States formally claimed only the same powers as a member of the Council, it was in substance claiming much more because of its freedom from League responsibilities and League participation. It was further pointed out that in addressing the reservation to the Court rather than to the Council, the United States sought to reserve the power to forbid the Court to give an opinion after the Council had requested it, thereby asking a power equal to that of the Council as a whole.

The third interpretation viewed the reservation as a legitimate insistence upon the recognized principle of mutual consent in the submission of disputes to arbitration or a court, except for the inclusion of the phrase "claims an interest." Taken literally, it was pointed out, this meant that the mere declaration by the United States that it had an interest in a dispute would compel the Court to declare itself incompetent without considering whether the claim was justified.

The general conclusion arrived at was that the reservation carried such grave possibilities of weakening the whole institution of advisory opinions that it could not be accepted without some safeguard. The safeguard agreed upon was that with regard to advisory opinions in which the United States claimed an interest but did not, in the opinion of the court, have one, the intervention of the United States would not necessarily prevent the Court from issuing an advisory opinion but would have the same effect as the adverse vote by a member of the Council or Assembly. A counter-reservation was also adopted permitting each signatory to withdraw its acceptance of the Senate's fourth and fifth reservations, if such action was taken by two-thirds of the parties other than the United States within a year.

The next move was to secure the consent of the United States to this amendment to the fifth reservation and to the counter-reservation pro-

posed by the conference. Efforts in this direction were halted, however, when President Coolidge on Nov. 11, 1926, announced that he did not feel warranted in asking the Senate to modify its position and that he saw no prospect of America's adhering to the Court without full acceptance of the Senate reservations.

Secretary of State Kellogg, in a circular letter to signatories of the World Court protocol sent out in March, 1929, suggested a renewal of negotiations for an agreement upon the matter of advisory opinions. His letter was referred to the second international committee of jurists, then about to consider amendments to the World Court protocol. The committee included Elihu Root who submitted a formula through which he hoped the signatories of the protocol would find it possible to accept the Senate's fifth reservation. The formula, with some modification, was accepted by the committee of jurists on March 11, and by the Tenth Assembly of the League of Nations in September after Secretary of State Stimson had announced that "it would effectively meet the objections represented in the reservations of the United States Senate and would constitute a satisfactory basis for the adherence of the United States."

The text of the protocol adjoined to the revised statute of the Court pledges the signatories of the protocol of Dec. 16, 1920, to accept the Senate's five reservations, and grants the United States equality with all members of the Council and Assembly in the election of judges or deputy judges of the Court. It further provides that the Court shall render advisory opinions under the same conditions as before. However, to insure that the Court shall not render an advisory opinion touching any dispute in which the United States has or claims an interest without its consent, the following procedure is provided.

The United States is to be informed of every request for an advisory opinion. If that country so desires there will be an exchange of views regarding it. An objection of the United States will be given the same weight as that of any member of the League. If no agreement is reached and the League decides that the Court must be asked to deliver the opinion, the United States may then withdraw from the Court "without any imputation of unfriendliness or unwillingness to cooperate generally for peace and good will." The protocol further provides that the United States may withdraw from the League at any time. Also, that the acceptance of the United States reservations by the other signatory states may be withdrawn if two-thirds or more of the signatories signify within a year from the receipt of the first notification that they so desire.

Before Mr. Root submitted his formula to the committee of jurists, it received the approval of President Coolidge and of leading Senators. President Hoover, in his Armistice Day address of Nov. 11, 1929, strongly urged America's adhesion to the Court in accordance with the terms of the new protocol. The original World Court statute of 1920, the Root protocol, and the protocol containing the above amendments to the original statute were signed on behalf of the United States government at Geneva Dec. 9, 1929, by Jay Pierrepont Moffat, American chargé d'affaires at Berne. Three steps remained to be taken before the participation of the United States in the work of the Court became effective:

(1) the signature of the Root protocol by Abyssinia, Albania, and Lithuania, the only three of the 53 members of the Court who had not yet signed it, (2) ratification by the United States Senate of all three protocols, and (3) ratification of the Root protocol by all 53 members of the Court.

Indications were that the matter of ratification would not come before the United States Senate until after the congressional elections of 1930. Senator Borah and other leading members of the Foreign Relations Committee announced that the Root protocol did not meet their objections to American participation and that they would oppose ratification. Nevertheless, it was anticipated that the resolution to ratify would secure the necessary two-thirds vote. Little difficulty was expected with regard to the other two steps.

The United States was the fifty-fourth state to sign the original statute, the fifty-first to sign the Root Protocol, and the forty-ninth to sign the amended statute.

WORLD LEAGUE AGAINST ALCOHOLISM. An international organization whose object is to attain by means of education and legislation the total suppression of alcoholism throughout the world; founded in 1916 at a conference of the Anti-Saloon League of America at Columbus, Ohio. Meetings are held triennially, an important one having taken place in 1927 at Winona Lake, Ind. The membership in 1927 was comprised of 56 national temperance organizations from 33 leading countries. Dr. Ernest H. Cherrington was general secretary in 1929. Headquarters are at Westerville, Ohio, with branch offices in London, England, Lausanne, Switzerland, Oslo, Norway and Toronto, Canada. See PROHIBITION.

WORLD WAR. On June 28, 1914, the Austrian heir apparent, Archduke Francis Ferdinand (see VOL. IX), and his wife were assassinated at Serajevo, the capital of Bosnia. This set in motion a train of events which culminated in the terrible catastrophe of the World War. It is clear, however, that this crime was not the real cause of the tremendous struggle which many of the statesmen and diplomats of Europe had anticipated and which all had feared for many years. The underlying causes of this tremendous struggle reach far back into the past and cannot be reduced to any simple formula. Some knowledge of the important political and economic forces shaping the history of Europe during the past century is necessary. Among the

many and complex influences suggested as causes of the War, three forces appear to have contributed most directly to the critical situation of Europe in 1914. These were (1) the clashing of national interests and ideals, (2) the maintenance of a system of military alliances, and (3) the economic rivalry among the nations of Europe.

National Antagonisms. Viewed broadly, the political history of Europe in the nineteenth century divides into two movements inherited from the French Revolution and Napoleonic era: (1) the growth of democracy, and (2) the realization of national liberty. When the diplomats of the great Powers met at the Congress of Vienna, 1814-15, to readjust the map of Europe, many expressed the hope that the Congress would be guided in its work by these two principles. Unfortunately, they were ignored whenever it was necessary to do so in order to satisfy the dynastic and personal influences which dominated the Congress. In the first place, these principles were anathema to the reactionaries, and in the second place, Metternich, the ultra-conservative Austrian Chancellor who dominated the Congress, realized that encouragement of the national principle would endanger the heterogeneous Austrian dominions. Consequently, the work of the Congress of Vienna was an effort to establish the status quo ante bellum. As a result of its endeavors, there were many violations of the principle of nationality.

Revolutionary periods, following one another during the nineteenth century, endeavored to undo the work of the Congress. Some of these were successful. For example, Belgium was separated from Holland, and Venetia and other Italian-speaking sections were taken away from Austria and joined to the newly-created Italian kingdom. At the close of the nineteenth century, however, several situations remained which clearly violated the principle of national sovereignty. Alsace and Lorraine, although not an inheritance of the French Revolution, clearly represented a violation of the above-mentioned principle. The newly-created German Empire annexed these provinces for reasons partly economic and partly political. French aggression following the battle of Jena, and the rich coal and iron mines in the region, were the fundamental reasons for annexation. The French people were constantly aware of the challenge to regain these lost provinces, and Bismarck used the French attitude as justification of his programme of huge military armaments in Germany.

Nowhere else in Europe was the problem of nationality so acute during the nineteenth and early twentieth centuries as in Austria-Hungary. The very existence of the Austro-Hungarian monarchy was a constant challenge to the principle of nationality. Logically carried out, this principle would mean the disappearance of Austria-Hungary and the distribution of its territories among the surrounding nations, or the creation of new ones. The appreciation of this fact made the Austrian authorities apprehensive of all nationalist movements and especially of that of the southern Slavs, in Serbia, Montenegro, Bosnia, etc. As will be seen, it was the outgrowth of one of these movements that led to the outbreak of the War. The Balkan states presented a peculiarly vexing problem in the realization of the principle of nationality. The intricate mixture of racial groups in this region made it an almost hopeless

task to arrange geographical boundaries to correspond with national lines. The problem was complicated, moreover, by the clashing of the interests of the great European powers, especially Austria and Russia, in this territory. The condition of chronic disorder and strife in this region during the nineteenth century was a source of almost constant concern to the diplomats of the great European states. While the triumph of the ideal of nationality did much to advance European civilization, it was not an unmixed blessing. Too often national patriotism became a fetish. Love of one's country meant a lack of appreciation or a contempt for the people of other countries, a feeling that the *Kultur* of one's country was not only different from but distinctly superior to that of any other country. From this it naturally followed that it was a laudable ambition to wish to impose one's superior civilization on an inferior people. From this developed the inevitable antagonism of national interests which dominated European politics during the nineteenth century. In its extreme form this national spirit found expression in movements to unite various related ethnic and racial groups into one political group. Such movements were more or less prominent in Germany, Russia, and the Balkan states, under the names of Pan-Germanism, Pan-Slavism, Pan-Serbianism, etc. It is doubtful whether any of these movements had passed beyond the state of vague aspirations held by a comparatively small group of people. As contributing causes of the War, the Pan-Slavic and Pan-Serbian movements were of some importance. The growth of such propaganda was a source of concern to Austria-Hungary, with its large Slavic population. In Germany, although the movement was limited to a comparatively small group, it was very active. Prominent historians, scientists, and philosophers expounded its views, while numerous societies were formed to advance German ideas of culture and civilization throughout the civilized world.

Military Alliances. One of the chief results of the prevalent spirit of intense nationalism was the feeling that it was necessary to defend it with huge armaments. Everywhere the doctrine of military preparedness was advocated, and it bore fruit in the tremendous standing armies and huge navies of the different European countries. It led also to the grouping of the great European powers into two hostile military alliances. The rise of Germany and Italy between 1860 and 1870 seriously disturbed the old European Concert formed at the Congress of Vienna. Bismarck was the guiding spirit in the formation of the first alliance. In order to isolate France he strove to unite Austria, Russia, and Germany. Russia soon withdrew because of inability to get along with Austria. Bismarck then bound Germany and Austria closer together, and in 1882 Italy joined the agreement, thereby forming the Triple Alliance. This was an unnatural alliance for Italy, inasmuch as her interests and Austria's were almost diametrically opposed both in Italia Irredenta and in the Balkans. France had checkmated Italy in Tunis, however, and this, with her support of the temporal power of the Pope, during the period of the Italian struggle for unity, led Italy to make this unnatural and, as later events proved, impossible alliance. It was not to be expected that the other powers

of Europe would view this Triple Alliance without concern. France and Russia formed a Dual Alliance (1895), and finally Great Britain, aroused by the threatening naval policy of Germany, abandoned her policy of "splendid isolation" and joined with France and Russia to form a second diplomatic group known as the Triple Entente. Largely through the efforts of Sir Edward Grey, misunderstandings among these three were cleared up and a "diplomatic group" established. The precise nature of this understanding was indefinite; no treaty agreement specified its scope. The formation of these two rival groups created a situation in Europe where every disturbance of the political or military status quo brought on a crisis. After 1905, Europe passed through several such crises, each one increasing the tension among the great powers and making the maintenance of peace more difficult.

The first crisis came in 1905, over the situation in Morocco. France in her negotiations with England had been granted a free hand in Morocco, and was engaged at this time in penetrating the country economically and politically. Germany considered this an opportune moment to assert herself and get a "place in the sun." She had definitely abandoned the Bismarck policy of indifference to colonial expansion and had determined to acquire colonies either in unclaimed territory or by taking those already under the sovereignty of another power. On Mar. 21, 1905, the German Emperor, while on a voyage to Constantinople, disembarked at Tangier and encouraged the Sultan to reject the scheme of reforms proposed by France. He also succeeded in forcing France to submit the whole Moroccan question to a conference of the powers held at Algiers in January, 1906. France won a distinct diplomatic victory when England strongly supported her and Italy refused to support her ally. One phase of Germany's policy of colonial and commercial expansion contemplated the extension of Teutonic commercial and political interests in the Balkans and Turkey. In this *Drang nach Osten*, Germany, in conjunction with Austria, hoped to create a great economic if not political sphere of influence, extending through the Balkans to Constantinople and thence through Turkey in Asia to the Persian Gulf. German engineers and German capitalists began to develop Turkish resources. German military officials trained the Turkish forces. In July, 1908, a revolution led by the Young Turks broke out in Constantinople. Taking advantage of this situation, Bulgaria annexed eastern Rumelia and declared her complete independence of Turkey. Austria annexed Bosnia and Herzegovina. Although Italy and Serbia were aroused by this action, Germany stood by her ally, and Russia was too weakened by the Russo-Japanese War to do more than protest feebly. The Teutonic allies had scored a distinct diplomatic success and another European crisis was passed. In 1911, a second Moroccan crisis brought war dangerously near. This was the so-called Agadir incident. It resulted in a compromise by which Germany recognized France's predominant interest in Morocco in return for 100,000 square miles of territory in the French Congo. The same year witnessed the Turco-Italian War, during which Germany was compelled to stand by and permit her protégé, Turkey, to be despoiled by her ally, Italy.

The Turco-Italian War was followed by a widespread upheaval in the Balkans. The Greeks, Bulgarians, Montenegrins, and Serbs, strongly resenting the attempt of the Young Turks to Ottomanize them, patched up their differences and organized the Balkan League. Despite the desire of the large powers to maintain the status quo in the Balkans, the League declared war on Turkey in October, 1912, and defeated her. A second Balkan war followed a dispute over the division of the spoils. Serbia, Greece, and Montenegro combined against Bulgaria and Rumania, and Turkey sided with them. The intervention of the great powers resulted in the establishment of an autonomous Albania under the kingship of Prince William of Wied. Germany and Austria were keenly disappointed as a result of the Balkan wars. Turkey had been practically driven from Europe, and the strengthening of the Balkan states and Russian influence in the peninsula checked the plans of Austria to reach the Aegean Sea at Saloniki. Germany's answer to her virtual defeat in the Balkans was the introduction of the Army Bill of 1913, which added 136,000 men and officers to the peace footing of the army. France replied by increasing her military service from two to three years. Russia, Austria-Hungary, and even the smaller nations of Europe caught the contagious army fever and either increased the peace footing of their armies or spent huge sums in further military preparations. Germany constructed strategic railways leading up to the Belgian frontier, and Russia projected construction of railways that would facilitate mobilization against Germany. A veritable panic was created in the spring of 1914 by the charges and countercharges appearing in the press of the various interested countries.

Economic Causes. At the close of the eighteenth century there occurred in Europe a complete transformation of industrial conditions, known as the industrial revolution. England was the first country to feel the effects of this change. In time, the industrial revolution reached other countries: France in the period after 1830, the United States in the period after the Civil War, and Germany after 1880. The great industrial interests in these countries began to compete with those of England for the control of the markets of the world. England had the advantage of having vast colonial possessions which might serve both as a market for her manufactured products and as a field for the investment of surplus capital in the development of their natural resources. France and the United States, to a lesser degree, also enjoyed this advantage. Germany, on the other hand, because of her later appearance as a world power, was practically without colonial possessions of any potential power. She felt that her industrial development was being hampered through no fault of her own but simply because the best parts of the world had been appropriated by others. Despite this unfavorable position in colonial affairs, Germany prospered commercially and industrially to a marvelous degree. By German apologists for the War, Great Britain was bitterly accused of envying German prosperity and of welcoming the War as an opportunity to crush German industrial and commercial activity. On the other hand, Germany was accused of waging war for economic aggrandizement. Two factors worked together to weld the many petty German states into a

united nation. One was the army and the other the industrial capitalists. After the Franco-Prussian War, these two groups demanded a protective tariff. The army class, composed almost entirely of landholding aristocrats, demanded a high tariff on farm products and a protective tariff on manufactured articles. Both groups desired to stifle competition in the home market. The tariff adopted in 1879 had far-reaching results. It led to distrust on the part of Russia and Germany for each other. In 1904, a 10-year reciprocity agreement was signed, whereby each country made certain reductions in its tariff duties. The Russians felt that the Germans had got the best of the bargain. In 1914, as the date approached for the renewal or modification of the treaty, fear was expressed in the German press lest Russia's improved army would enable her to demand more favorable terms. In this fashion the desire of each nation to tax foreign imports and at the same time to obtain free admission of its own products into foreign countries stimulated militarism and provoked war-like sentiments among the powers. The United Kingdom adhered to its free trade policy and with few exceptions admitted the products of all lands on equal footing. The British self-governing colonies, however, had adopted protection.

Whether because of the protective tariff wall or because of other causes, the business interests of the Empire prospered mightily. By 1912, British foreign commerce excelled the German by about \$1,300,000,000; but German commerce had trebled itself since 1883, while British commerce had not quite doubled. The German government derived rich revenues from the customs duties on an expanding commerce, and viewed with satisfaction the prodigious increase in wealth and population (population increased from 41,000,000 to 66,000,000 between 1871 and 1912) which furnished men and money for an ever-growing army. The landowning and industrial classes considered the army a protection and insurance for their interests. In one respect, however, the German business community was dissatisfied. The German merchant marine, although it had rapidly expanded, was still four times outweighed by British shipping. Great Britain's superiority was ascribed to her earlier economic development, to the fact that Germany had very little Atlantic seacoast and to the superiority of the British navy. Germany, therefore, set herself to overcome these handicaps. Undoubtedly many German businessmen desired the overthrow of the British naval power and the acquisition of an Atlantic seaport such as Ostend in Belgium. Desires just as strong were urging Russia on to Constantinople and the southern Baltic, Serbia on to the Adriatic, and Austria-Hungary on to Saloniki.

In the carving out of a colonial empire, the interests of the industrial and commercial classes also clashed. In the last quarter of the nineteenth century certain groups of businessmen awoke to the opportunities which the vast uncivilized areas of Africa and Oceania offered for the sale of cheap cotton goods, cheap liquors, and other manufactures, for the highly remunerative investment of money in the construction of railways, the development of mines and the traffic in rubber, ivory and oil. King Leopold of Belgium, one of the first to realize the opportunity, acquired control of the Congo region in the heart of Africa. France carved out a

mighty colonial empire, and Great Britain added to hers. Germany, a belated arrival in the field, was permitted, even encouraged by the British government, to acquire territories in Africa; but when Germany challenged the French in Morocco and appeared envious of the British and French possessions, the prospect of a war for world empire began to fill Europe with uneasy forebodings. Concessions as well as colonies were contended for by German, French and British capitalists. For example, when, in 1914, Bulgaria, in return for a loan, arranged to concede to German capitalists valuable railway and mining privileges in Bulgaria, a rival bid was unsuccessfully made by the French. The financing of the Bagdad railroad occasioned considerable rivalry among France, Germany and Great Britain until an agreement was reached. Each nation raised an envious outcry when a competing nation secured for itself some new economic plum. In 1914, German interests maintained that they were being outstripped by the other powers; that the English were greedily helping themselves to the oil product of Persia and striving to secure the oil fields of Latin America; that the French capitalists were securing new railway contracts in China, in Russia, and in Greece.

Of all economic interests inimical to peace, the most dangerous was the arms-manufacturing business. In Germany, the Krupps were accused of stirring up hostility between France and Germany in order to obtain larger orders for arms. Every army bill, every dreadnought, meant profits for the armament firms. The Balkan wars were fought with weapons forged in Germany and France. English firms—Armstrong and Vickers and Whitworth—were engaged to build an ordnance factory in Russia and to construct battleships for Spain, for Brazil, for Turkey. For the armament manufacturers of all nations, the War was a golden opportunity.

Finally a word may be added regarding the banking interests and the War. The panic and consternation in financial circles at the outbreak of the War have been cited as conclusive proof that capital did not want the War. While there is doubtless much truth in this reasoning, the fact must not be overlooked that in panics large fortunes are won as well as lost. The huge war loans, moreover, offered unexampled opportunities for financial speculation.

OUTBREAK OF THE WAR AND NEUTRAL NATIONS

The assassination of the Archduke Francis Ferdinand on June 28, 1914, was followed, on July 23, by the presentation of a note to Serbia by Count Berchtold, the Austro-Hungarian Foreign Minister. The note began by recalling the declaration made by Serbia on Mar. 31, 1909, wherein Serbia recognized the *fact accompli* regarding Bosnia and agreed to renounce any attitude of protest or opposition to the annexation of Bosnia to Austria. The Austrian note then went on to complain that Serbia had not lived up to this undertaking, and had made it necessary for Austria to take action to protect herself against the Pan-Serbian propaganda. Austria insisted that Serbia should make an official and public condemnation of this propaganda and express regret at its consequences. The note then submitted 10 specific demands and required an answer from Serbia within 48 hours of the presentation of the note. These demands

required that Serbia should suppress every publication that excited hatred of the Dual Monarchy; that the Serbian government dissolve certain societies accused of fomenting the propaganda hostile to Austria, that teachers guilty of instigating hatred of Austria be dismissed and that objectionable matter in the textbooks be eliminated; that Serbia dismiss from her army and governmental employ all officers and officials found taking part in the propaganda; that Serbia accept the collaboration of agents of the Austro-Hungarian government in suppression of the subversive movement against Austria, that Austro-Hungarian representatives be allowed to take part in the investigation of persons in Serbia accused of complicity in the murder of the Archduke; that Serbia take action against two specified officials who were accused of complicity in the crime at Serajevo; that Serbia take effective measures to stop the smuggling of arms and ammunition across her border; and, finally, that Serbia give explanation of the expressions of hostility toward Austria-Hungary on the part of certain high Serbian officials.

The publication of this note immediately aroused great apprehension in the chancelleries of the European powers. It was clear that Europe was confronted by another serious crisis. The first move of Sir Edward Grey, the British Foreign Minister, was to urge on Austria-Hungary the necessity of extending the time limit of the ultimatum. M. Sazonov, the Russian Foreign Minister, strongly supported him in this. Austria flatly refused any extension of time and they then turned their efforts toward the persuasion of Serbia to accept, as far as possible, the demands made by Austria.

The Serbian Reply. The Serbian reply was handed to the Austrian minister on July 25, only two minutes before the expiration of the time limit. Most of the Austrian demands were granted with slight verbal changes. There were two points, however, with which Serbia did not comply: (1) To the demand that Serbia accept the collaboration of agents of the Austrian government in the suppression of the subversive movement directed against the territorial integrity of the Dual Monarchy, Serbia replied that she did not understand exactly the meaning of the demand but that she was ready to accept such collaboration as should conform to the principles of international law and criminal procedure. (The Austrian rejoinder stated that it was not a question of international law but of the exercise of police powers which could be settled by agreement between the parties concerned.) (2) The demand made by Austria that Austrian officials be permitted to take part in the investigation relating to the judicial proceeding in Serbia against persons involved in the Serajevo crime, the Serbian government would not concede, on the ground that such action would violate the Serbian constitution. (The Austrian rejoinder accused the Serbian government of deliberately misrepresenting the Austrian demand, which contemplated simply a participation in the preliminary investigation to the judicial proceedings.) Finally, the Serbian government agreed, in case the Austrian government should find the reply unsatisfactory, to submit the disputed questions to The Hague tribunal or the Great Powers for decision. Austria considered Serbia's reply entirely unsatisfactory. This meant war unless

some unforeseen action of the Great Powers checked it.

The Russian Ambassador to Vienna stated on July 24 that "any action taken by Austria to humiliate Serbia could not leave Russia indifferent." Russia felt that the crushing of Serbia would reduce her to a vassal state of Austria, and that this would imperil the balance of power in the Balkans. In view of this situation the Russian Foreign Minister stated that Russia would mobilize against Austria on the day that the Austrian army crossed the Serbian frontier. This determined attitude rendered futile any efforts the other powers might make to localize the struggle. Germany's position was fairly well defined by repeated statements that it was Austria's affair but, if any other power interfered, her interests were vitally affected. On July 26, Sir Edward Grey suggested a conference of the representatives of the four powers, England, France, Germany and Italy, for the purpose of discovering an issue which would prevent complications between Austria and Russia. To this suggestion France and Italy agreed; Germany, however, declined to fall in with this plan. The German Foreign Minister stated that "a conference such as Sir Edward Grey suggested would amount to a court of arbitration and could not, in his opinion, be called together except at the request of Austria and Russia," and furthermore, that he did not think it (the conference) would be effective, because such a conference would, in his opinion, have had the appearance of an Areopagus consisting of two powers of each group sitting in judgment upon the two remaining powers.

Direct negotiations between Russia and Austria were unsuccessful, Austria refusing to consider a modification of her ultimatum to Serbia. Further efforts on the part of England to have Germany propose some formula which would be acceptable proved unavailing, and on July 28, 1914, Austria declared war on Serbia. This action on the part of Austria appears explicable on one of two grounds. Either she was convinced that Russia was bluffing and would back down, as she did in 1908, or else Austria was prepared, deliberately, to precipitate a European war.

Germany and Russia. Russia had continuously maintained that the fate of Serbia was of great concern to herself, and as a result of the Serbian note she declared partial mobilization against Austria. These military preparations caused frantic efforts on the part of the various governments to prevent a general European conflagration. On July 29, Sir Edward Grey urged that "the German government should suggest any method by which the influence of the four powers could be used to prevent war between Austria and Russia." Italy and France agreed. Germany agreed to the extent of urging Austria to renew her negotiations with Russia. At the same time, Russia was to prepare a formula that would be satisfactory to herself. This was done, but it was entirely unsatisfactory to Austria and Germany. Sir Edward Grey brought additional pressure to bear upon Germany. Germany, on her part, brought pressure to bear on Austria to agree to discuss with Russia the terms of the Austrian ultimatum, and at the last moment, on July 31, Austria agreed to do so. This slender hope of avoiding a world-wide catastrophe was nullified by the demand made by Germany that Russia

should cease her military preparations and demobilize her army. Russia made no reply to this ultimatum and at 5 P.M. on August 1, the Russian government was notified that Germany considered a state of war existed between the two countries.

Germany and France. At the same time that Germany presented the ultimatum to Russia, a communication was sent to France informing her of Germany's action and asking what attitude France would take in the event of war between Germany and Russia. An answer was demanded within 18 hours. To this demand the French Premier replied on August 1 that "France would take such action as her interests might require." Despite this unsatisfactory answer the German Ambassador did not leave Paris until August 3. In the meantime, charges and countercharges were made by the French and German authorities that warlike moves had been made on the frontier.

Great Britain and Germany. From the first it was evident that the question of England's attitude in the face of the great European crisis was of the most vital importance. Russia and France continually urged upon her the necessity of coming out definitely and stating that she would firmly support her allies. Sir Edward Grey refused to do this, arguing that he could accomplish more as a mediator. Germany fully appreciated the importance of keeping Great Britain neutral if possible. The German Chancellor requested that Sir Edward Grey formulate conditions on which Great Britain would remain neutral. This was declined with the statement, "We must keep our hands free." The British government, therefore, up to the very last day of European peace, refused either to bind herself to come to the aid of France and Russia or to remain neutral. Great Britain's complete entrance into the war came about as a result of the violation of Belgian neutrality, although partial intervention was brought about when, on August 2, Sir Edward Grey informed the French government that the British fleet would protect the northern coast of France from any attack by the German fleet. On July 31, Grey telegraphed the British ambassadors at Paris and Berlin to request the French and German governments to state whether they were prepared to respect the neutrality of Belgium so long as no other power violated it. France replied affirmatively but Germany evaded a direct answer. On August 2, the German Minister presented to the Belgian Foreign Minister an ultimatum which stated that Germany had "reliable information . . . of the intention of France to march through Belgian territory," that it was "an imperative duty for the preservation of Germany to forestall this attack." Germany agreed to evacuate Belgian territory as soon as the war was over and to indemnify Belgium for all damages if she would maintain an attitude of "friendly neutrality." In case of refusal, Germany stated, Belgium would be considered as an enemy and the question would be left "to a decision of arms." Belgium refused and called upon the signatories of the Treaty of 1839 to carry out the guarantee of Belgian neutrality. In response to this request, Sir Edward Grey, on Aug. 4, 1914, sent an ultimatum to Germany demanding a satisfactory reply to the request that Belgian neutrality be respected and requiring an answer by midnight of the same day.

Upon Germany's refusal to give such a guarantee, Great Britain declared war on Germany. Despite Germany's efforts to justify the invasion of Belgium on other grounds, to the impartial observer it would appear that Germany's justification must rest entirely on the ground of military necessity. Notes taken by the German Ambassador to London during this period, Prince Lichnowsky, were published in 1918 and caused a sensation by their revelation of the friendly attitude of England and her desire to maintain peace in the period preceding the War. His *Heading for the Abyss* was published in London shortly after Lichnowsky's death in 1928.

Italy's Position. At the outbreak of the War, Italy found herself in a most trying position. To Germany and Austria she was bound by the defensive treaty of the Triple Alliance. Her position as a member of this alliance had, from the beginning, been unnatural, largely because of her aspirations in Trieste, the Trentino and the Balkans. In practically all the crises of the twentieth century, Italy stood aloof from her allies. When war broke out in 1914, Italy declared that she would remain neutral. During the next 10 months a struggle went on throughout the entire country between the neutralists and the interventionists. Despite efforts on the part of Germany and Austria to satisfy Italy's demands on the Adriatic, Italy declared war against her former allies on May 24, 1915. See *ITALY, History*.

Japan's Position. Japan's entrance into the War was due to her treaty of alliance with Great Britain. This treaty (1902) largely came about as the result of the loss of the fruits of the Chinese-Japanese War at the hands of Germany, France and Russia. Actuated by motives of revenge for this humiliation as well as by a determination to carry out her obligations to Great Britain, Japan declared war on Germany on Aug. 23, 1914. See *JAPAN, History*.

Turkey. Germanic influence had for a number of years prior to the outbreak of the War been predominant in Turkey. It was natural, therefore, that Turkish sympathies should be with the Teutonic allies. Turkey hesitated, at first, to make common cause with Germany, because of her exposed position and the fact that the two Balkan wars had left her exhausted, but events soon forced her to show her hand, and when, on October 29, the *Breslau*, a German warship which had taken refuge in Turkish waters, bombarded the Russian Black Sea port of Theodosia, Russia broke off diplomatic relations. This action was followed by France and England's declaring war on Turkey on Nov. 5, 1914. See *TURKEY, History*.

Balkan States. Serbia and Montenegro were involved in the War from the first, the latter coming to the aid of the former within two weeks after Austria's declaration of war. The Triple Alliance and the Triple Entente were keenly desirous of obtaining the aid of Bulgaria, Greece and Rumania. In October, 1915, Bulgaria threw in her lot with the Teutonic Allies, frankly stating that the proposals made by them were more alluring than others and expressing the belief that they were going to win the war. (See *BULGARIA, History*) In Greece, conflicting influences and interests complicated the situation. The King (Constantine) was pro-German, while the Premier, Venizelos, was pro-Ally. The King was strong enough, in the beginning, to thwart the attempts

of the Entente to have Greece enter the War on the Allied side. In June, 1917, he was compelled to abdicate and turn the government over to his second son, Alexander. Shortly after this (July 2) the Greek government declared war against Bulgaria and Germany. For the rapidly changing vicissitudes of the Greek government during this period see *GREECE, History*. In Rumania the situation was very similar to that in Bulgaria. The reigning house was pro-German while the majority of the people were pro-French and Italian. The Premier, Bratianu, advocated a policy of waiting, with the intention of entering the war at the proper time, when the greatest reward could be obtained by the least fighting. This policy was continued until Apr. 28, 1916, when the Rumanian Minister at Vienna presented a note to the Austro-Hungarian Foreign Minister which said that Rumania considered herself at war with Austria-Hungary since 9 o'clock the previous evening. See *RUMANIA, History*.

Portugal. Portugal was bound by a treaty of alliance with Great Britain, and, at the outbreak of the War, said she was willing to live up to her obligations whenever Great Britain saw fit. In February, 1916, she seized some German vessels in her harbors, and on Mar. 8, 1916, Germany declared war on her, giving this seizure as the cause. See *PORTUGAL, History*.

The United States. As the largest and most important of the neutral powers at the outbreak of the War, the United States was sure to be vitally affected. As the champion of smaller neutral nations and as the source of vast quantities of war supplies, it was only natural that the attempt to maintain strict neutrality was a trying one. The problem was made more difficult by the attitude of groups of persons in this country whose sympathies were with one or the other of the belligerents in Europe. From time to time, the American government was involved in important discussions with the European powers. The more important of these were, Blockade and Neutral Trade, Interference with Mail, the Sinking of the *Lusitania*, the Mexico Note, and Submarine Warfare and the War Zone. Chiefly as a result of the controversy with Germany over this last subject, the United States declared war against her on Apr. 6, 1917. Shortly after the United States declared war, the following states either severed diplomatic relations with Germany or declared war on her: Cuba, Panama, Costa Rica, Guatemala, Nicaragua, Honduras, Haiti, Brazil, Liberia, Siam and China (qqv.). For the relations to the war of countries not mentioned in this section, see section *History*, in the articles treating those countries. For convenience, the following dates for the declarations of war are given:

CENTRAL POWERS

Austria against Serbia—July 28, 1914.
Austria against Russia—Aug. 6, 1914.
Austria against Montenegro—Aug. 9, 1914.
Austria against Japan—Aug. 27, 1914.
Austria against Belgium—Aug. 28, 1914.
Bulgaria against Serbia—Oct. 14, 1915.
Germany against Russia—Aug. 1, 1914.
Germany against France—Aug. 3, 1914.
Germany against Belgium—Aug. 4, 1914.
Germany against Portugal—Mar. 9, 1916.
Germany against Rumania—Sept. 14, 1916.
Turkey against the Allies—Nov. 23, 1914.
Turkey against Rumania—Aug. 29, 1916.

ENTENTE ALLIES

Brazil against Germany—Oct. 26, 1917.
China against Austria and Germany—Aug. 14, 1917.

Costa Rica against Germany—May 24, 1918.
 Cuba against Germany—Apr. 7, 1917.
 France against Germany—Aug. 3, 1914.
 France against Austria—Aug. 13, 1914.
 France against Turkey—Nov. 5, 1914.
 France against Bulgaria—Oct. 16, 1915.
 Great Britain against Germany—Aug. 4, 1914.
 Great Britain against Austria—Aug. 13, 1914.
 Great Britain against Turkey—Nov. 5, 1914.
 Great Britain against Bulgaria—Oct. 15, 1914.
 Greece (provisional government) against Germany and Bulgaria—Nov. 28, 1916.
 Greece (Alexander's government) against Germany and Bulgaria—July 2, 1917.
 Guatemala against Germany—Apr. 23, 1918.
 Haiti against Germany—July 15, 1918.
 Honduras against Germany—July 19, 1918.
 Italy against Austria—May 24, 1915.
 Italy against Turkey—Aug. 21, 1915.
 Italy against Bulgaria—Oct. 19, 1915.
 Italy against Germany—Aug. 28, 1916.
 Japan against Germany—Aug. 23, 1914.
 Liberia against Germany—Aug. 4, 1917.
 Montenegro against Germany—Aug. 9, 1914.
 Nicaragua against Germany—May 7, 1918.
 Panama against Germany—Apr. 7, 1917.
 Panama against Austria—Dec. 10, 1917.
 Portugal against Germany—Nov. 28, 1914.
 (Passed resolutions authorizing military intervention as treaty ally of Great Britain)
 Portugal against Germany—May 19, 1915
 (Military aid granted)
 Rumania against Austria—Aug. 27, 1916
 (Allies of Austria also considered it a declaration against them)
 Russia against Turkey—Nov. 3, 1914.
 Russia against Bulgaria—Oct. 19, 1915.
 San Marino against Austria—May 24, 1915.
 Serbia against Germany—Aug. 6, 1914.
 Serbia against Turkey—Dec. 2, 1914.
 Serbia against Bulgaria—Oct. 19, 1915.
 Siam against Germany and Austria—July 22, 1917.
 The Hedjaz (Arabia) against Central Powers—June 9, 1916.
 United States against Germany—Apr. 6, 1917.
 United States against Austria—Dec. 7, 1917.

Later Evidence Concerning the Outbreak of the War. The overthrow of the governments of Russia, Germany, and Austria-Hungary, and the seizure of documents from the archives of Belgium by the invading Germans, gave many important documents to a waiting world long before they would have appeared in the course of normal events. Added to these have been numerous memoirs and autobiographies which are, of course, of relative value only, but yet shed some light on the diplomatic exchanges just preceding the world conflagration. When the archives of France, Great Britain, Italy, and the United States are made public in their entirety, a true history of the month or so preceding the War may be written.

Various interpretations have been placed upon these later documents, although it is generally agreed that they do not alter the fundamental causes of the War. According to the "revisionist" school, led by Professors Harry Elmer Barnes and Sidney B. Fay, these documents render untenable the dictum of the Versailles Treaty that Germany and her allies were solely responsible for the outbreak of the struggle. The other school, which includes Herbert Adams Gibbons, contends that they do not absolve Germany and Austria of responsibility for precipitating the War. Professor Barnes assessed the blame in a graduated manner upon the following countries: Austria, Russia, France, Germany, and England. He completely exonerated Belgium, held that Italy was only slightly responsible, and asserted that the United States was duped into entering a struggle concerning which she knew little, if anything. Professor Fay, in *The Origins of the World War* (2 vols., 1928), held that while none of the Powers wanted a European war, all were responsible for its outbreak to a greater or less degree, and that the documents made public since the Peace Conference have effectively re-

pudiated the "war guilt" clause of the Versailles Treaty. He found it impossible, however, to fix a mathematical responsibility, as Professor Barnes attempted to do. In 1927-28 three volumes of a ten-volume series of *British Documents on the Origins of the War, 1898-1914*, were published in London under the editorship of the historians, George Peabody Gooch and Harold Temperley.

MILITARY OPERATIONS

General Considerations. The War that broke out in July, 1914, involved three continents and the seven seas. Beginning with the declaration of war on Serbia by the Austro-Hungarian Empire, in a few days it spread to involve Germany, France and Russia. With the announced invasion of Belgium by the German armies, Belgium and Great Britain took up arms. Military operations began on three European fronts—the Western or Franco-Belgian, the Eastern or Russian, and the Southern or Serbian. Turkey next entered the War toward the close of 1914. In May, 1915, Italy joined the Allies and a new front of operations opened on the Austro-Italian frontier. In November of that year Bulgaria joined the Central Powers, the Serbians were driven from their country and a new front of operations was established on the Greek frontier north of Saloniki. In August, 1916, Rumania joined the Allies and a new front was established on the Rumanian-Hungarian-Bulgarian frontier. The conquest of the German colonies in China, South Africa, and the islands of the sea began soon after the outbreak of War. In 1916, Portugal joined the Allies and sent a corps to the Western front. In 1917, Greece and the United States joined the Allies, the troops of the former being employed on the Salonikan front and those of the latter mainly on the Western front.

In this War, every known resource of mechanical ingenuity was drawn upon, old and forgotten methods of warfare were brought into play side by side with the most powerful modern artillery, while aeronautics and poisonous gases for the first time had occasion to show their worth. The edifice of international law so painfully built up after centuries of struggle was toppled over as a thing of no account. Again it was demonstrated that, in a long war, the side with appreciatively greater resources in men and materials of war will win if the people, their governments and military commanders have sufficient courage to endure temporary defeats and discouragements.

In the space available, nothing but a statement of the principal facts can be attempted, but the nature of the struggle on the Western front calls for a word or two. When both forces simultaneously reached the Channel after the battle of the Marne, there began a siege over the whole front that gave the struggle in this theatre a character unique in military history. At certain places in the "line," 32 or more parallel lines of German trenches were constructed. Similar defenses existed on the Allied side. Frontal attacks became a necessity since flanks there were none, and yet these attacks for years proved failures because the experiences gained under the new conditions had not as yet led to such disposition of resources as would carry them to a decision. The most desperate efforts were made first by one side and then by the other to raise the siege, so to speak, by a concentration at some selected

point and thus break through to open warfare and end a situation that only a few years before would have seemed intolerable. It was not until the summer of 1918, after the Germans had made their last and greatest attempt and the Allies had been reinforced by the American troops, that a break-through was effected and the War brought to a close. On some of the other fronts, the phenomena of what might be called old fashioned warfare were more or less produced but in general there was a marked tendency to approximate to the conditions on the Western front.

A marked feature of this War was the so-called mobilization of industries. So great was the draft made on the industrial resources of the countries involved that the struggle, other conditions being equal, may be said to have resolved itself into a competition, each side striving to outstrip the other in supplies and munitions.

General Strategy. In a description of a war in which many fronts are involved, it is necessary to treat the operations on each front separately; but as these were parts of a general whole and as all were more or less related, it seems best to preface these descriptions by a short description of the operations as related to each other in time and in strategy.

Plans for a possible war between the Triple and Double Alliances were prepared long before the War by the coordinating staffs of the armies. These plans were revised from year to year to conform to new conditions. On both sides the plans contemplated offensive campaigns. That of the Triple Alliance provided for an invasion of France in which about nine-tenths of the German forces were to be employed, assisted by corps of the Italian army not required for the defense of the Franco-Italian frontier. A small fraction of the German army with the entire Austro-Hungarian army was to be employed on the Russian frontier. In order to avoid the delay that would be occasioned by a frontal attack on the French frontier fortresses that formed two strong barriers, Verdun-Toul and Epinal-Belfort, it was proposed to make the main thrust to the north through Belgium and Luxemburg and force the French to fight in the open country which forms the basins of the Oise, Marne and Seine rivers and their tributaries. It was assumed that the French, at the beginning of operations, would invade Lorraine from Epinal and Toul, a line along that frontier was therefore selected to be organized for defense and a part of the German force in the west was assigned to its defense. It was thought that this French force would soon be withdrawn to meet the attack from the north. The invasion of Belgium would probably cause Belgium and Great Britain to declare war, but the Belgian army was not a strong one and Great Britain had only a small force that could be used in the first operations. It was hoped that in France such a decisive victory would be won as would compel France to sue for peace, in which case it was thought that the war would end. Should Russia continue the war, practically the whole German army would be available on that front. In August, 1914, however, it was known that Italy would not take part in the operations and Austria was already engaged in a war with Serbia, and could not at once employ her whole army against Russia. Confident that their

plans for a decision in the west could be secured before Russia could appear in force in the east, the Germans declared war. It was not many days after the beginning of operations that the Germans realized that operations were not going as anticipated, in spite of their first victories, and that their flanking operations on both flanks had failed. Their western armies were weakened, (1) by the necessity of detaching troops to watch the Belgian army, which had wisely avoided risks in the open field and retired to the fortress of Antwerp, ready to attack the German communications; (2) by the necessity of detaching troops to invest a number of French fortifications which with their garrisons were left in their rear, and (3) by the necessity of sending troops from the West front to East Prussia where the Russians had invaded that province sooner than had been expected. The German plan was completely shattered by the unexpected battle of the Marne. From then to the close of the year, the Germans made a number of attempts to outflank the French line, but without success; and at the close of the year, the two armies lay behind intrenched lines extending from the Channel to Switzerland and open warfare was no longer possible for either side until the opposing line was penetrated on a very wide front.

The Franco-Russian plan proposed a simultaneous advance of the entire French army in the west and the Russian in the east to compel the Germans to divide their army into fractions each of which would be smaller than the Allied army opposing it. Long before the War, it had been noticed that the Germans were building detrainning stations along the Belgian frontier. This indicated a German movement through Belgium, though it might be only a ruse. After the formation of the Triple Entente, in view of a possible German movement through Belgium which would probably cause Great Britain to declare war, the coordinating staffs of France, Belgium and Great Britain made plans to meet this situation. However, the French military authorities could not count on the German invasion of Belgium, since it was possible that the Germans would advance directly over the Franco-German frontier. Their plan was, therefore, at the outbreak of the war, to move their troops to the Franco-German frontier but also to provide an alternative to meet the changed conditions caused by the German invasion of Belgium. The shifting of troops to meet the invasion of Belgium would necessarily delay the French offensive but it would be compensated for by its reinforcement by the Belgian and British armies. There was much discussion in France of this German invasion of Belgium, and opinion was divided as to whether the Germans would advance through southern Belgium only, avoiding the fortresses of Liège and Namur, or advance across the Meuse also on either side of Liège and attack the two fortresses. The French plans contemplated only an advance through southern Belgium and trusted that the two fortresses would hold out long enough to permit the French and British to go to the assistance of the Belgian army. In any case, the Belgian army was to avoid the risk of capture in the open field and take refuge in the fortress of Antwerp.

The Germans announced their intention of moving through Belgium immediately after declaring war on France and two days later were

at war also with Great Britain and Belgium. The French troops, therefore, were deployed along the frontier, according to the second plan. As soon as the troops were in position the French offensive began along the entire front but was shattered on the entire line except in upper Alsace, which was an unimportant front. The Belgian army took refuge in Antwerp and the British and French began a retreat from Belgium across the frontier in order to permit troops to be withdrawn from the French right, which was strong, to the left, which was weak, in order to resume the offensive. This favorable opportunity for resuming the offensive along the entire front did not occur until the armies were south of the Marne with the flanks resting on the fortresses of Verdun and Paris, when the battle of the Marne took place and the German armies were compelled to retreat. At first it was believed that the German armies would retire to the frontier but in a few days it was found that they had taken a strong position on the Aisne, which was extended eastward to the Meuse north of Verdun and could not be dislodged. Then began the flanking operations that closed when the western flanks rested on the Channel. On the Eastern front just as the German armies were marching into Belgium, the great Russian offensive began and two strong armies advanced into East Prussia and four into Austria. The small German force could not resist the advance and advised German Headquarters that it might be necessary to withdraw from East Prussia. However, under a new commander, in the battle of Tannenberg one of the Russian armies was decisively defeated with great loss and with the assistance of the corps sent from the west, the other was driven back across the frontier. In the Austrian province of Galicia the four Russian armies advanced slowly and steadily, overcoming all resistance, their crushing operations were likened by the press to those of a steam roller. Their cavalry was already threading its way through the passes of the Carpathians into Hungary when German Headquarters sent from the intrenched fronts in the west troops to assist the Austrians. The Russians had to cease their advance against the Austrians to meet the German advance in centre Poland. Here the lines swayed back and forth between the frontier and the Vistula River to the close of the year, when, as in the west, both armies were intrenched for the winter. On the Southern front the Austrians undertook two punitive expeditions into Serbia, both of which ended disastrously for the Austrians. The Serbians made no attempt to cross the frontier and thus operations on this front died out.

The first year had brought no decision. Both sides had experienced severe losses and had used up most of their reserve supplies of munitions, at its close the munitions problem assumed great importance. It was a particularly serious one to Great Britain, who was faced by the necessity of raising and maintaining an army equal to that of France. The advantages of the interior position occupied by the Central Powers became apparent as soon as the lines were intrenched. Under cover of the intrenchments, reserves could be shifted rapidly from the Western to the Eastern frontier due to the fine railway system of Germany.

At the beginning of 1915, the Allies still had hopes that success could be secured through the

great Russian armies and operations on the Western front were confined mostly to attacks here and there to prevent the Germans from sending troops from the west to the east. Only once did they make an attack with the hope of breaking through on a wide front. On the Eastern front the Germans found the situation far from satisfactory as the Austrian armies were greatly demoralized. To restore confidence, it was necessary to dislodge the Russians from their threatening position so that if necessary some of the troops could be returned to the Western front. In May, therefore, began the great drive in the east. The Russian line was broken in the south and the Russian armies in Austrian Galicia were in full retreat. To check this disaster and draw troops from this front, the Allied Powers persuaded Italy, who had been listening to the diplomats of both sides, to declare war against the Central Powers. War was declared on May 23 and the Italian armies were deployed on the Austro-Italian frontier. The Italian declaration of war did not have as great an effect as the Allies hoped. Although the Austrians were compelled to detach troops to go to the new front, that front was already well intrenched and the drive against the Russians had gained such a momentum that it still went on. The Russians were driven back across the frontier and lost all their frontier fortresses on the Niemen, Narew, Vistula, and Bug Rivers. When the drive ceased about the middle of September, near the Baltic the Russians were behind the Duna River between Riga and Dunaburg. From Dunaburg the line ran straight south to the Dniester River. As soon as the armies ceased active operations, the line was intrenched. The Russians had experienced tremendous losses in men and munitions of war; the former could be readily replaced but not the latter because of the isolated position of Russia. The Russian army could again resume the offensive under favorable conditions but all hope that it would be the decisive factor in the War on the side of the Allies had to be abandoned. On the Italian front nothing worthy of note occurred during the year.

War between Turkey and the Allied powers was declared in November, 1914, and soon developed on four fronts. In Armenia, the Russian Caucasian army invaded Turkey in November to capture Erzerum. In December, it was defeated between Erzerum and the frontier and retired pursued by the Turkish eastern army. The Turks in turn were defeated in January and operations on this front ceased, as neither the Russians nor the Turks could spare forces from other fronts to reinforce these armies. In Mesopotamia, in November, 1914, the British Indian government landed a force near the mouth of the Tigris River primarily to protect the oil fields in southwestern Persia. This force was gradually increased and slowly made its way up the Tigris River, meeting with slight resistance. In the latter part of September, it captured and occupied Kut. Bagdad was now only 100 miles distant and the temptation to effect its capture proved too much for the commanding officers of the Tigris Expeditionary Force. With a little more than a division, the attempt was made in November, but before the force reached Bagdad it was attacked by a superior Turkish force and in a few days found itself back in Kut invested by

the Turks. In the west in January, 1915, the Turks assembled a small army in southern Palestine for the purpose of crossing the Sinai Desert and the Suez Canal, possibly in the hope of raising an insurrection in Egypt. That it ever got across the desert is a marvel in itself and would have been impossible except for the favorable condition of the desert wells. A few boatloads of troops actually got across the canal. The army was unable to maintain itself along the canal and retired leaving detachments to guard the scattered wells.

The most important operations in Turkey in 1915 were those connected with the ill-fated Gallipoli Expedition. The opening of the Turkish straits to secure communication with Russia and the destruction of the Turkish Black Sea fleet must have appeared as important strategic objectives as soon as Turkey entered the War. Whether this could be best effected by an attack of the defenses of the Dardanelles directly or obtained as a result of operations from a point on the Turkish coast farther south was not so clear. There were also some who argued that a decision on the Western front was impossible for some time, as it would take time to solve the munitions problem and in the meantime it would be better to attack the Turkish armies and compel Turkey to make peace. Owing to the requests of both British and French commanders on the Western front for more troops, it was difficult to find troops for any new expedition. In Egypt, however, were the Australian and New Zealand troops being trained for war, a division of Territorials from England and some troops from India. After the defeat of the Turkish desert expedition, these became available but as they were untried troops it was desirable to have at least one division of regulars. This was slated for France but, after the first great offensive of the British failed at Neuve Chapelle, it was decided to send the division to Turkey. The Dardanelles operations began with a naval attack to force the entrance, which failed. It was followed some time after by the landing of British and French forces (April 24) to capture the Gallipoli Peninsula. In the meantime the Turks had been warned and met both the landing of troops and the subsequent operations to capture the peninsula with such obstinate resistance that in November it was decided to abandon the project and withdraw the troops. Most of the British troops returned to Egypt and were later sent to other fronts. The Allies had hoped that the Greek army would assist in the Gallipoli operations, but in this they were disappointed.

As soon as Turkey entered the War, Bulgaria occupied a very strategic position, it became even more important when the Allies landed at Gallipoli. If she joined the Allies and threatened Constantinople it would cause the Turks to reinforce that front and weaken their resistance at Gallipoli. It would cut Turkey from all communication with her two allies and might cause her prompt surrender. On the other hand, if she joined the Central Powers it would enable them to open direct communication through Serbia and Bulgaria with Turkey and give them the advantage of interior lines to all fronts. The diplomats of both sides therefore began a contest to win Bulgaria but in this contest the Allies were handicapped by the enmity between the Bulgarians and Serbians as a result of the Balkan War and by the

successful campaign of the Central Powers in Russia. Bulgaria probably entered into a secret agreement to join the Central Powers in September, 1915, as the Germans and Austrians both withdrew troops from other fronts and in the latter part of that month each concentrated an army on the Serbian frontier. The two armies invaded Serbia early in October and were soon joined by the Bulgarians. It was all the Serbian commander could do to save his armies, which he did by crossing the mountains in winter and reaching the Adriatic with sorely depleted ranks. On the island of Corfu the Serbian army was reorganized.

To protect the Serbian retreat, which it was hoped could be effected in the direction of Saloniki, both British and French landed forces at that point where they began the construction of a great intrenched camp. The armies of the Central Powers did not cross the Greek frontier and shortly thereafter most of the German and Austrian divisions were withdrawn from Bulgaria. The international railway through Serbia to Constantinople was put in operation.

The operations of 1915 had increased the number of fronts and the number of countries engaged in the War but had brought no important decision on any front. During 1915, the British force on the Western front was greatly increased and was able to relieve the French on a much wider front. At the close of the year the British had three armies on this front, each composed of three corps, each stronger than a French corps. This permitted the French to withdraw some of their armies and place them in reserve.

The Allied plan for the Western, Eastern and Italian fronts for 1916 was to remain on the defensive until the Russian army could be reorganized and then assume the offensive simultaneously on all fronts. Rumania had until now remained neutral but in this year promised to declare war on Austria and invade Hungary as soon as her armies were ready. Before she acted, however, the Allies were to begin an offensive from Saloniki and thus keep the Bulgarian forces on that front. In this offensive the Allies again counted on securing the assistance of the Greek army. In Turkey the Russians promised to renew the invasion of Armenia and thus assist the British in their operations to rescue the British force invested in Kut. Some of these plans had to be modified, as the Central Powers took the initiative this year.

The Germans planned to remain on the defensive on the Eastern front and again assume the offensive in the west. Their drive this time was against the fortress of Verdun whose capture would have an important effect on the morale of the French nation. The Austrians were requested to remain on the defensive on both the Russian and the Italian fronts, but they would not consent to this and planned an offensive campaign against the Italians from the Trent region. In Turkey the principal operation planned was the capture of the British force in Kut. On other fronts the Turks were to remain on the defensive.

The Verdun offensive, which developed into a great offensive on both sides of the Meuse and from first to last employed a very large fraction of both the German and French forces in the west, failed in its purpose although the Germans almost reached the town. It lasted from the middle of February until the middle of July.

While it was in progress, a fourth British army took its position in line to enable French troops to go to Verdun. In May the Austrian offensive in Italy took place and the Austrians advanced from the Trentino and almost reached their objective, which was the Italian plain in the rear of the Italian armies on the Isonzo. Knowing that to raise this attacking force the Austrians must have withdrawn troops from the Russian front, the Allies requested Russia to attack the Austrians on their front. The Russians attacked on a broad front and the Austrian line immediately gave way, and the Russian advanced about 40 miles on a front 80 miles. To check the Russian advance, German and even Turkish troops were sent to the Austrian front and the Austrians were obliged to send back troops from the Trentino.

It was while the Russians were still advancing that the British and French made their great offensive in the west—the Somme drive—to relieve the pressure on Verdun, assist the Russians and Italians, and also prepare for the entrance of Rumania into the War by keeping the German forces employed. This great offensive began July 1 and lasted into November. It enabled the French to make counterattacks in the Verdun sector in October and December and recover a part of the territory captured by the Germans in the first half of the year. The Russian offensive enabled the Italians to advance along the Isonzo and capture the town of Goritz in August.

In the intrenched camp of Saloniki, there were assembled the reorganized Serbian army, a number of British and French divisions, and a Russian division. This force was placed under a French commander, Sarrail, and about August 1 he began the offensive which was to precede the declaration of war by Rumania. Again the Allies requested the assistance of the Greek government, which was refused; and lest the Greek army should prove a menace in their rear, the Allies forced the Greek government to demobilize its army. The fact that the Allied armies at Saloniki were in Greek territory and Greece was still neutral made a complicated situation. The offensive began August 1 and continued until November. The Rumanians expected the advance to be into Bulgaria but in this direction the Allies made no headway. They did, however, penetrate Serbia and recapture Monastir.

Rumania declared war August 27, at this time the Western front was ablaze with the Somme drive in the north and the Italian offensive in the south and the Central Powers could withdraw no troops from those fronts. On the other hand, the operations on the Russian front had subsided and the Saloniki drive had made no appreciable effect on that front. The Central Powers, therefore, were able to assemble two armies under German commanders to meet the new offensive; one formed of German, Bulgarian and Turkish troops was assembled in Bulgaria and another of German and Austrian troops in Hungary. At first the Rumanians swept over the mountains into Transylvania but they had to be recalled when the hostile army penetrated Rumania south of the Danube River from Bulgaria. The other hostile army then penetrated the mountains and reached the Rumanian plain from the north and the two armies united in front of the Rumanian capital, Bucharest. The Central Powers

were able to drive the Rumanians out of southern Rumania but aided by Russian troops the Rumanians were able to hold eastern Rumania. Operations in Rumania ceased at the end of the year.

In Armenia the Russian armies crossed the frontier and in succession captured Erzerum, Trebizond and Erzingan; a further advance into a mountainous country without railways proved impossible and the advance stopped about the middle of the year. At this time the Turks were busily engaged farther south with the British forces on the Tigris. After the fall of Kut in the last of April, active operations on the Tigris ceased until the close of the year, which enabled the Turks to turn their attention to the Russians, whom they compelled to evacuate a part of the territory in their possession. The British government was dissatisfied with the conduct of affairs on the Tigris by the Indian government and they were transferred to the Imperial General Staff. Troops were sent to this section from Egypt and efforts were made to rescue the British troops in Kut. All attempts made during the first part of 1916 failed and on April 29 the garrison surrendered. British prestige could not allow the situation to end in this manner, so during the remainder of the year preparations were made for an advance on Bagdad as soon as winter came and the weather was favorable. On the desert front, the British troops occupied posts on the east bank of the Suez Canal and began the construction of a railway along the coast in preparation for an invasion of Palestine. The Turks made several futile attempts to interfere with railway construction but the work went steadily on and at the close of the year was within 15 miles of El Arish, the Turkish frontier post.

In 1916, in spite of elaborate preparations and combinations there had been no decision on any front. The Allies had been reinforced by Rumania and Portugal but only one corps of the latter country was sent to the Western front, where it was attached to a British army. For the Allies the situation in the east was very unsatisfactory and French officers were sent to reorganize the Rumanian army. In June, 1916, Lord Kitchener started for Russia to study the situation there but was lost at sea. Of the Central Powers, Turkey had about reached the end of her resources and Austria was rapidly approaching the same state. In all the Central states there was a feeling of depression due to the length of the War and to the realization of the superiority of the Allies in men, wealth and resources. The blockade was daily becoming more oppressive. No longer confident of winning on land, German Headquarters decided to win at sea by an unrestricted war by its U-boats on all vessels, hostile and neutral bringing supplies to Allied ports. On land the operations were to be defensive primarily.

In 1916, the British army reached its maximum strength and now the Allies were superior both in artillery and aircraft. The condition of the Turkish and Austrian armies was known and the Allies confidently expected to end the war in 1917 although it was known that no great effort could be expected from Russia or Rumania. On all other fronts a vigorous offensive was planned. To forestall the Germans and take advantage of the wedge driven in the German line by the Somme drive, an at-

tack was to begin early in the year. This salient was to be the centre of attack, which was to be extended far north by the British and to the east as far as Reims by the French. It was confidently believed a break-through would result. As in 1916, the Germans secured the initiative, not, however, by an attack but by a retreat. About the middle of March, on the entire front from the vicinity of Arras to that of Soissons, they fell back to a new line selected and intrenched that winter, which at one point was 25 miles behind their original line. As they retreated they destroyed everything of military value to the Allies and blocked all the roads. This retreat strengthened the German position by shortening the line to be held. As it would take some time for the Allied armies on the front that had been evacuated to make preparations for a new attack, it was decided to make a British attack to the north and a French attack to the east. The British attack met with considerable success but was not a break-through, the French attack was repulsed. The French commander had been so confident of success and had promised so much that his repulse had a serious effect on the morale of the French army. The morale was restored by two successful attacks under a new commander in August and September on small fronts. During the remainder of the year, the British engaged in two other offensives, one east of Ypres and the other at Cambrai, in which ground was gained but no decision was secured.

In Russia, conditions both in the government and the army were becoming more chaotic. The Czar abdicated and the Kerensky government came into power. Of the armies, only the southern group remained a fairly disciplined army and with these the Russians assumed the offensive in July, at first successful, under counterattacks they quickly crumbled and for the first time in the War retired behind the border on that front. In the north the Germans captured Riga. When the Kerensky government fell in November an armistice was declared on that front.

The Italians fought with great vigor and with considerable success until the end of September, when, due to heavy losses, offensive operations closed. From the point of view of the Central Powers the situation seemed so desperate that a German army was sent to this front. With this army as the spear point a counter-offensive was begun in October, the Italian line was pierced and the Italians were compelled to retreat until they reached the Piave River far in the rear. Here they were reinforced by French and British troops and the retreat was stopped.

Practically nothing was done on the Saloniki front during the year. In June, the Allies compelled the King of Greece to leave the country; the government was reorganized and in July declared war on the Central Powers. The remainder of the year was spent in reorganizing the Greek Army and bringing it to the Salonikan front.

Practically nothing was accomplished on the Rumanian front and when in December the Russians agreed to an armistice with the Central Powers the Rumanian government was obliged to do the same.

The greatest Allied successes of the year were gained by the British in Turkey. The campaign in Mesopotamia began in December, 1916, and

in the latter part of February the Turks were manoeuvred out of Kut with its strong defenses and retired on Bagdad. The British followed and entered Bagdad, March 11. The British now consolidated their hold by occupying the country for a considerable distance around Bagdad. On the desert front, the British reached Rafa with their railroad and troops early in 1917. Their objective now was the Turkish frontier position of Gaza, upon which they made two unsuccessful attacks in March and April. The advance was then postponed until the end of October. The Turks were now manoeuvred out of this position and retreated rapidly northward followed by the British. Jaffa was evacuated by the Turks on November 15 and Jerusalem on December 9. In Turkey, resistance was practically broken and the end was in sight.

Although there had been no decisive events on any front save that of Turkey, the War was nearer its end than any one anticipated—the U-boat warfare failed to secure decisive results, but had caused the United States to declare war. The entrance of the United States in the War produced immediately a tremendous effect on all the countries engaged in it. With the enormous resources of this country in men and materials added to their own, the Allies were sure to win. The only question in doubt was when the Americans would be ready.

For the year 1918, the Allies proposed to remain on the defensive on the Western front until the Americans were ready to take the field in sufficient force. On the Italian front it was necessary to remain on the defensive until the Italian Army was reorganized. On the Salonikan front and in Palestine the offensive was to be resumed as soon as practicable.

The Central Powers could not remain on the defensive. Failing to win the war by U-boat operations, they were obliged to again try it on land. Little could be expected of the Bulgarians or Turks, who were necessarily on the defensive, but as the Russians and Rumanians were no longer at war the troops on these fronts could be greatly reduced and thus a striking force could be assembled by the Germans and Austrians on the Western and Italian fronts.

The Germans had been preparing for this last offensive during the winter as they wished to launch it as early in the year as possible. They attacked on the Western front and in succession three great wedges were driven in the Allied lines, but the lines were not actually broken. All attempts to connect or extend the areas gained in these attacks failed. The successive attacks lasted from the middle of March to the middle of July. Then began the Allied counterattacks and by the middle of September the Germans were practically back in their original lines with greatly shattered forces. The final campaign began towards the end of the month and ended with the Armistice, November 11.

The Austrians made their great attack on the Piave May 15-22 and met with a repulse. After this they were completely discouraged and when the Italians made a counterattack on October 24 they offered little resistance, as they realized that the War was practically over. Bulgaria had surrendered and the German armies were in retreat.

The advance from Saloniki began September 14 and here too the Bulgarians offered little

resistance as they realized that with the Germans in retreat the War was practically lost. On September 30, war was over on this front.

In Turkey, the British Palestine army was not able to undertake offensive operations until the latter part of September because during the first months of the year it was necessary to develop the railways and secure supplies. Then in April, to meet the German attacks in the west, a large number of troops were withdrawn from this front and sent to reinforce the British armies in France; they were replaced by Indian troops from Mesopotamia and other points. The advance was begun in the latter part of September and in a few days the Turkish armies in front were either captured or dispersed. The Turkish armistice was signed October 30.

For technical discussions of the conduct of the War, see the following articles: ARTILLERY; ORDNANCE, TRENCH WARFARE MATERIAL; SMALL ARMS AND MACHINE GUNS; EXPLOSIVES; STRATEGY AND TACTICS; ARMIES AND ARMY ORGANIZATION, CHIEFICAL WARFARE. See also the articles AFRICA; ARABIA; PERSIA; etc., for accounts of special phases of the War.

THE WESTERN FRONT

Mobilization and Concentration. For operations on the Western front, Germany mobilized 35 active and reserve army corps, 4 cavalry corps and 25 Landwehr brigades for field service besides a number of divisions assigned to the defense of her western fortresses. The field troops were organized into seven armies, all of whom were to be on her western frontier on August 16 ready for active operations.

	Army corps	Landwehr brigades
I Army—von Kluck	7	3
II Army—von Bulow	6	2
III Army—von Hausen	4	1
IV Army—Crown Prince Wurtemberg	5	1
V Army—Crown Prince Germany	5	5
VI Army—Crown Prince Bavaria	5	6
VII Army—von Heeringen	3	7

During the preliminary operations, the four cavalry corps were under German Headquarters but later were assigned to the armies 1st to II army, 2d to I army, 3d to VI army and 4th to V army.

The I and II armies were to invade Belgium and cross the Meuse River between the Holland frontier and Namur. The III, IV and V armies were to cross southern Belgium and Luxemburg and reach the Meuse River between Namur and Verdun. The VI and VII armies were to occupy an intrenched position along the French frontier south of Metz to meet any French advance into Lorraine. To the II army was assigned the task of capturing the fortress of Liège and to the II and III armies that of Namur. To the I army was assigned the task of dealing with the Belgian army and outflanking the French and British armies.

Belgium mobilized her six divisions and sent one to defend Liège and another to defend Namur. From the others she formed a small field army.

France mobilized her 21 active corps, a colonial corps, 25 reserve divisions, 10 cavalry divisions, and several Territorial divisions. The

active corps were organized into five armies:

	Army corps	Cavalry divisions
I Army—Dubail	5	2
II Army—Castaing	5	2
III Army—Ruffey	4	1
IV Army—Langle de Cary	5	1
V Army—Lanrezac	3	1

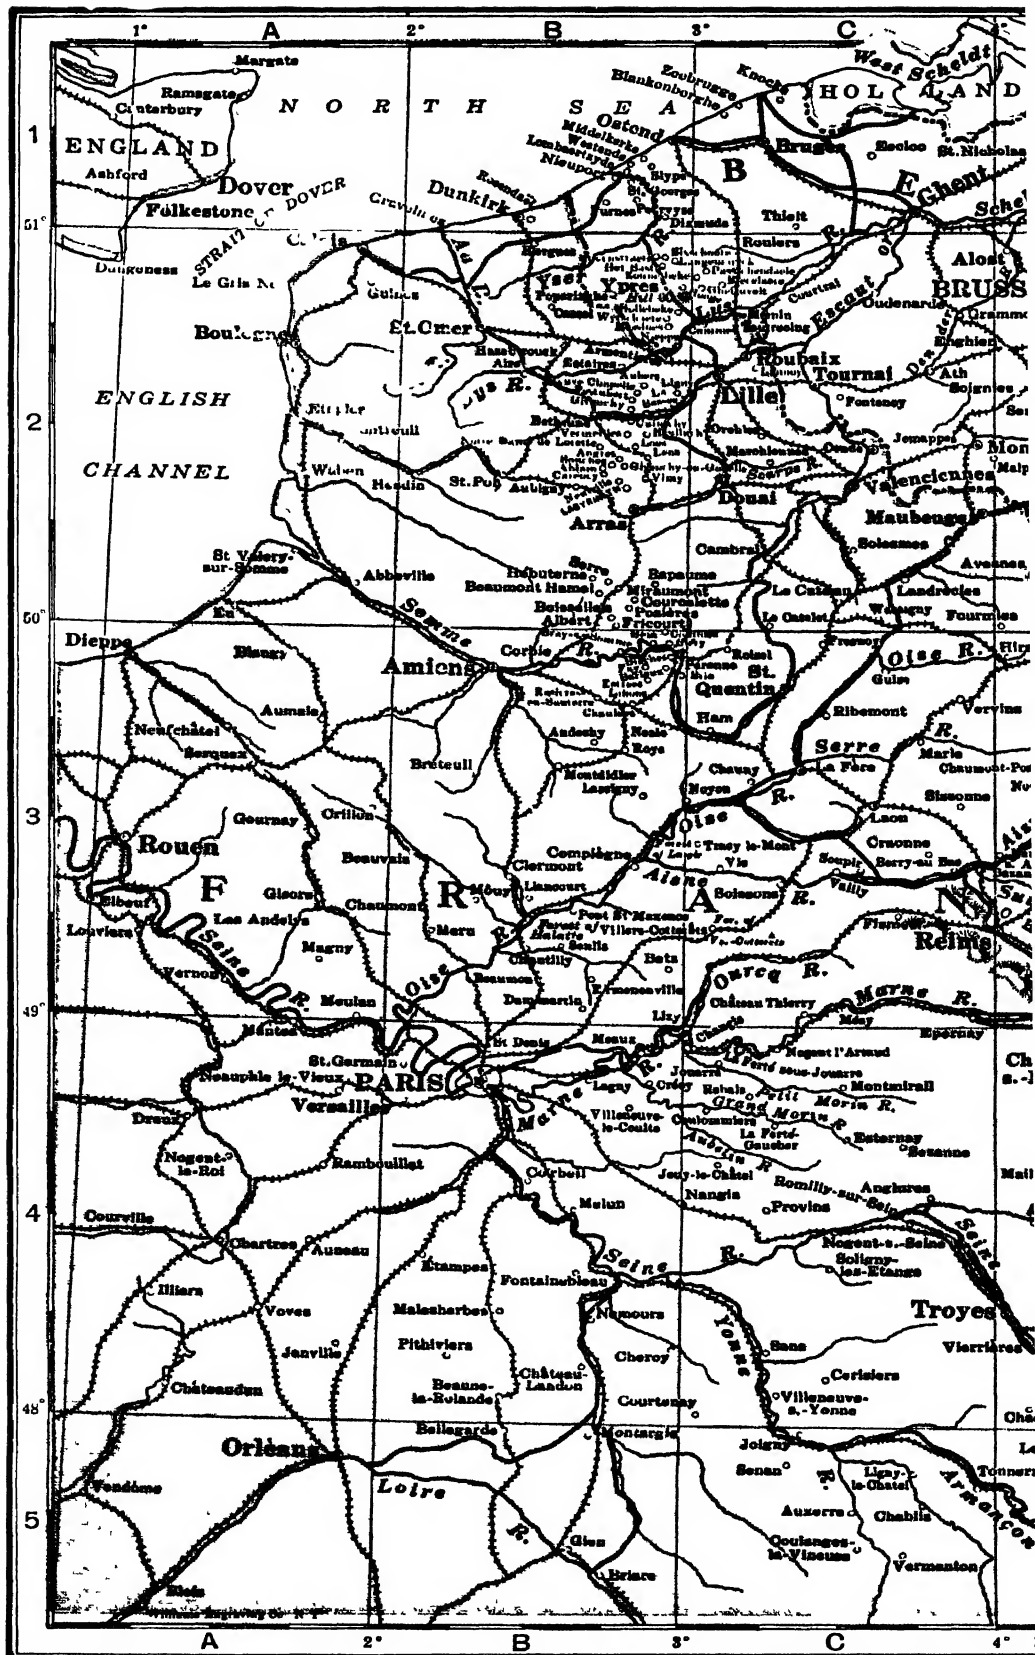

Three cavalry divisions were formed into a separate corps—Sordet—subject to the orders of the French commander-in-chief, Joffre. Some of the reserve divisions were assigned to the armies and the others to the frontier fortresses and to the defense of Paris.

The I army covered the frontier from Belfort to the north of Epinal; four of its corps were on the left ready to invade Lorraine with the II army. The II army had four corps in front of Nancy and one in reserve. The III army was in front of Verdun ready to advance into Lorraine north of Metz. Between the II and III armies was a so-called VI army—Manoury—consisting of three or four reserve divisions designed to invest the fortress of Metz. The V army was on the Meuse River between Mézières and Verdun, guarding the flank of the III and ready to support it. The IV army formed a general reserve behind Verdun ready to support either the II or III army. The position of the armies was based on the possible concentration of the German armies on the Franco-German frontier. Should the Germans violate the neutrality of Belgium the plan provided for the movement of the V army northward into the angle between the Sambre and Meuse Rivers; the IV army was then to replace the V army on the Meuse between Mézières and Verdun.

Battles of the Frontier. It was Joffre's plan to assume the offensive as soon as his armies were in position. The I and II armies were ready on August 15, and having organized a VII army—Pau—from the corps and reserve divisions around Belfort, he ordered the VII, I and II armies to advance. The VII army met with slight resistance and advanced until recalled by the defeat of the I and II. These two armies advanced and on August 20 encountered an equal force of the VI and VII German armies occupying a strong position near the frontier. The French attack being repulsed, the French armies retired slowly and took an equally strong position on the Meurthe and Mortagne Rivers guarding the Charmes gap between Nancy and the Vosges Mountains. The Germans were unable to break the line and each army was practically engaged in holding the other until the battle of the Marne was over. The Germans then retired to an intrenched line near the frontier in order to release some of the corps. The battle was known as that of Lorraine or Charmes.

As soon as the IV French army was in position and had received further reinforcements, the III and IV armies were directed to cross the frontier into Luxemburg and southern Belgium and break up the German troops moving through that area. In the forest of Ardennes they encountered an equal force of the IV and V German armies, August 22, and here, too, the French were compelled to withdraw. This battle was known as that of Ardennes.

The V French army moved up in the angle of the Meuse and Sambre Rivers and posted one

corps along the Meuse and the other two along the Sambre. In this section the French cavalry corps had endeavored to ascertain the German forces east of the Meuse but was unable to penetrate the cavalry screen formed of the 1st and 4th German cavalry corps. The V army was reinforced by this cavalry corps, a corps from the II army, two divisions from Algiers and three reserve divisions. As soon as it received its reinforcements and the British army arrived on its left, it was to cross the Sambre River and attack the Germans there.

The British mobilized their so-called Expeditionary Force consisting of six divisions and a division of cavalry. Four of these divisions, the 1st and 2d army corps, with the cavalry were at once sent to France and detrained in the vicinity of the fortress of Maubeuge.

On this front the Germans secured the initiative and made the attack. Early in August troops of the II German army attempted to capture Liège by surprise. They did succeed in taking the town with its bridges but were obliged to reduce the surrounding forts with heavy artillery. The last fort fell on the day the armies were ready to advance. On the 17th, the I and II armies moved out and on the 20th were on the line Brussels-Namur; the III army started for the Meuse south of Namur. One corps each of the II and III armies was assigned the task of investing this fortress while it was being reduced by artillery. The I and II armies were preceded by the 2d cavalry corps and the III army by the 1st cavalry corps. When the III reached the Meuse the 1st cavalry corps was to move around Namur and join the II army. The Belgian army offered no resistance to the advance but retired to Antwerp.

Before the V French army had received its reinforcements it was attacked by the II German army on August 22, and lost the line of the Sambre River, on the following day it was again attacked by the II and its rear threatened by the III which succeeded in forcing the Meuse in its rear. There was naught to do but retreat, which began on the 24th. This battle is known as Chatteroi.

While the II German army was advancing to the Sambre, the I army with its cavalry division was seeking the British army whose position was unknown. While moving in a south-westerly direction from Brussels, British forces were discovered in the vicinity of Mons on August 22 but it was thought they were only outposts. As a matter of fact, however, the British army had come in position that day between the Scheldt and Sambre Rivers along the Condé-Mons canal. On the 23d, therefore, two of the German corps unexpectedly ran on the British main position and the battle of Mons began about noon. The British resisted stubbornly but were obliged to yield the canal near Mons and fall back to another position. That evening a third German corps appeared in their front.

Not wishing to be outflanked, that night the British commander, French, ordered his army to retire next day to a line running west from Maubeuge. On the 24th the Germans hoped for a decisive victory but the British successfully withdrew their army.

Joffre's Second Plan On the night of August 24, Joffre realized that he had met defeat in the battles on the frontier and that he must

retreat in order to save his armies of the left and centre. The British army was in danger of being outflanked and a dangerous gap was being opened between the V and IV armies due to the withdrawal of the V from the Meuse.

To renew the offensive a new army was needed on his left and this he proposed to form on the Somme River between Amiens and Péronne from troops drawn from the east. It was to be under the command of Manoury, who was to bring two of his divisions with him; the other troops were to be taken from the VII and III armies. The immediate problem was to delay the advance of the I German army until this new VI army could be formed. West of the British he had formed the VIII army—D'Amade—of four Territorial divisions of little value and to this army he now sent two reserve divisions from Paris. The British V, IV, and III armies were directed to fall back slowly to the line Péronne-Verdun. The 1st cavalry corps was detached from the V army and ordered to cover the left flank of the British army.

On the 25th, the British continued their retreat but due to the topographical features of the country the two corps were compelled to follow divergent lines and that night were widely separated. As the French cavalry had not yet reached his left, the British commander ordered both corps to continue the retreat the next day. The 1st corps—Haig—did so but the commander of the 2d corps—Smith Dorrien—decided to rest his corps as his rear guard reached camp late at night. He now had three divisions, as a fifth division of the Expeditionary Force joined him that day. As the I German army was pursuing rapidly there resulted the battle of Le Cateau. The British held their own for some time but as the German force was constantly increasing the British were ordered to retreat in the afternoon. To break off the engagement was a difficult operation attended with considerable loss, and the British retreated in great confusion, but the Germans did not pursue as they too were worn out and their cavalry corps was held in check by the French cavalry corps that gained the flank of the British that afternoon. The British army next day continued its retreat until it crossed the Oise between La Fère and Noyon, where it was reorganized.

At this time German Headquarters at Coblenz made certain decisions that had a disastrous effect on the German operations on the Western front. Influenced probably by the optimistic reports of its army commanders in the west, it decided to send two corps from the west to East Prussia. As the two corps engaged in the investment of Namur, which was occupied on August 25, had not yet rejoined their armies, they were ordered to withdraw and entrain. A corps from the V army was also ordered back to Metz to be ready. As two corps had been left by the I army to observe the Belgians, the original invading force of 27 corps was reduced to 22. Of these 22, on August 27 the II army had to detach one and one-half corps to besiege Maubeuge, where the French had left a garrison of some 35,000 troops and the III army had to leave a division to invest Givet. Of these besieging troops only a half division rejoined before the battle of the Marne. A second decision was to give the commander of the I German army, who had been under the orders of the commander of the II army, an

independent command. On the morning after the battle of Le Cateau, therefore, the I army broke away from the II army and started in the direction of Péronne. By this move it prevented Joffre from forming his new VI army on the Somme but it prevented the I army from participating in force in a battle a few days later.

When the I army moved off it left the II army, now reduced to seven divisions and the 1st cavalry corps, to continue the pursuit of the V French and British armies although the V French army alone had 12 divisions. The retreat of the British army had been contrary to Joffre's plan and he now decided to make a counterattack with the V army to gain time and allow the British to recover. On the 27th, the V French army crossed the Oise and was ordered to halt and prepare for battle. The battle of St. Quentin-Guise was fought on the 29th and morning of the 30th. Although a drawn battle, the German II army barely escaped defeat and suffered severe losses. The German commander was obliged to call a division from his investing force at Maubeuge and for assistance from the nearest corps of the I army.

Meeting with no great resistance in his march to the Somme, von Kluck began to doubt the wisdom of his movement when on August 28 he received a new order from Headquarters. Joffre's retreat had deceived the German Headquarters and it was believed that the French left and centre had met with decisive defeat and were retreating on Paris. The II army was therefore directed to move on Paris and the I toward the Seine west of Paris. Von Kluck, therefore, continued for two days more in that direction, meeting detachments of the new French army which avoided serious engagements but retired before him. On the 29th he learned of the battle of St. Quentin-Guise and on the 30th was informed that the French had retired and to gain decisive results it was desirable that the I army should act on their flank as the II needed a day's rest. Von Kluck now started to move in a southeasterly direction and informed German Headquarters, which gave its approval. He crossed the Oise and found the British still north of the Marne. He made preparations to attack them but they escaped across the river. Next he found that the V French army was just reaching the Marne and he attempted to interfere with its crossing.

At this time he had no intention of crossing the Marne but on the night of September 2 he received a message from German Headquarters to the following effect:

Desire of Supreme Command to force French in a southeasterly direction away from Paris. I army will follow II army en échelon and will protect the flank.

As he was now at least a day's march in advance of the II army which was at least a day's march in rear of the V French army, his army was the only one that could act on the flank of the French but if he did so act he must disobey the order to follow the II army and also risk exposing the flank of the armies to an attack from Paris. On the following morning he learned that one of his corps had crossed the Marne at Château-Thierry and was engaged in battle. He had now to decide whether to withdraw the corps or go to its assistance. His flying corps reported the British retreating south of the Marne and no evidence of activity

on the Paris front, so he decided to support his corps and crossed the Marne with four of his five corps and two of his three cavalry divisions.

Joffre's Third Plan. After the battle of St. Quentin-Guise, Joffre was satisfied that his armies must retire still farther south before the offensive could be resumed. The limit was to be the Seine for the British and V French army and for the IV and III the Aube and Ornain with the flank resting on the fortified ridge east of the Meuse.

In retreating the IV French army had offered such resistance that the IV German army was compelled to call to its assistance the III German army, which prevented that army from assisting the II in the battle of St. Quentin-Guise. On the appearance of the III German army Joffre detached the left wing of the IV army and placed it under the command of Foch as the Foch Detachment; it later became the IX army. In its retreat the front of the III army was shortened, which enabled Joffre to order one of its corps to Paris and a division to Foch. Joffre also withdrew some of the cavalry divisions with the I and II armies and formed the 2d cavalry corps—de Mitry—between the V and British armies. The V army retreated to the Seine at Nogent, Foch toward the Aube, and the IV to the Ornain and the III between the Ornain and the Meuse.

On the morning of September 5, von Kluck, who was still north of the Marne, received the following message from Headquarters:

I and II armies will remain opposite the east front of Paris, the I army between the Oise and Marne, the II between the Marne and Seine.

At that time four of his corps were on the south side of the Marne and would reach the Grand Morin between Coulommiers and Esternay that night. In their front were the 1st and 2d German cavalry corps. The British and V French armies were apparently retreating along their front. As there seemed to be no reason to break up the plans for the day, he decided to let the movements go on but to issue orders for the withdrawal of his army to the north side of the Marne the next day. In the evening a staff officer from Headquarters came to see him and explained the general situation. The III, IV, and V German armies were making slow progress southward and the I and II armies were to remain stationary until these armies advanced far enough to threaten the rear of the I and II French armies, cause them to retreat and thus permit the VI and VII German armies to advance. That night neither von Kluck, who had crossed the Marne that day, nor the German Headquarters had the slightest suspicion of a French counterattack, although it had already begun north of the Marne.

When the French armies began their retreat to the Marne, Gallieni was made military governor of Paris and the VI army was finally organized east of Paris. Gallieni kept himself informed of the movement of the I German army and communicated his knowledge to Joffre at his headquarters at Bar-sur-Aube, where the movements of the armies were carefully plotted. At 6 p.m. on the 4th of September it was known that von Kluck had crossed the Marne and reached the Petit Morin with three of his corps and that only one with a cavalry division was left in front of Paris. If he continued the advance on the morrow he would reach the Grand

Morin and his front would be stretched to nearly 50 miles. At last a favorable opportunity for a counterstroke had arrived. On the night of the 4th and morning of the 5th all the armies received their orders. They were briefly that the VI and British armies on either side of the Seine were to attack von Kluck's army from the west while the V army attacked it from the south. The IX army was to hold the II German army in check and protect the flank of the V army. The IV and III armies were to attack the IV and V German armies, the III striking their flank. September 5 was to be spent in preparation and the attack was to be on the morning of the 6th. With his orders Joffre issued a stirring appeal to his troops:

"At the moment the battle begins upon which the safety of the country depends each one must make up his mind no longer to give to the rear. Every effort must be centred on attacking the enemy and forcing him back. An organization that finds itself unable to advance must hold the captured ground cost what it may and allow itself to be annihilated rather than retreat. Under the circumstances no weakness can be tolerated."

The orders were received with delight by officers and men who were tired of retreating before an enemy they felt they could face.

Battle of the Marne. Although not contemplated, the battle of the Marne really began on the afternoon of September 5, when the VI French army was moving into position and two of its reserve divisions unexpectedly encountered the corps that von Kluck had left in front of Paris. The reserves were repulsed but, the German cavalry discovering other troops advancing, the German corps retired during the night and took up a more favorable position some miles in the rear. Von Kluck was informed of this during the night but still did not anticipate a battle, however, he warned the nearest corps to go to the threatened front as soon as possible. The battle of the Marne thus begun was fought continuously until the afternoon of the 9th, when the I, II and III German armies began their retreat. In front of the IV and V German armies it lasted some days longer. On the Paris front, in the battle of the Ourcq, between the VI French and I German armies, the lines swayed back and forward as new troops were thrown into the line on one side or the other. It was not until the 9th that von Kluck was able to bring up his last corps which had been fighting daily south of the Marne from the 3d to the 6th with the V French army and then had to march 50 miles to reach its place in line. It was in this battle that Gallieni used the Paris taxis to take newly arrived troops to a threatened position in the line.

The II German army found in its front the IX French army and on the right the V army. It called to its assistance a part of the III army and succeeded in forcing back the right wing of the IX army but its own right wing was forced back by the advance of the left of the V army. On the first day of the battle there was nothing in front of the British army except the 2d German cavalry corps, on the second day there was nothing in front of the left of the V French army and the 2d French cavalry corps but the 1st German cavalry corps. On the afternoon of the 8th, the advance of the V army forced the commander of the II German army to withdraw his right wing in order to rest his flank on the Marne. On the morning of the

9th, the British were seen advancing to the Marne between the two German armies and the commander of the II German army decided that the time had come to retreat in order to close the gap. This opinion he imparted to the staff officer from Headquarters who had remained with the armies. The II and III armies were authorized by the latter to begin the retreat that afternoon and he personally delivered the order to retreat to the chief of staff of the I army. Von Kluck was loath to retreat as he had just started an attack which was progressing satisfactorily but he could not continue if the II was retreating so he gave orders for the withdrawal. No decision was reached in the fight between the IV and V German armies and the III and IV French but the former were compelled to fall back when the II and III recrossed the Marne.

The battle of the Marne must be regarded as a significant defeat for the German armies as it completely shattered the plan on which the War was based. Flushed with success, having the initiative, opposed by troops supposedly dispirited by defeat after defeat during a long and exhausting retreat, the Germans found this check as unexpected as the French found it welcome. On the French side moral forces were developed, the intensity of which continued undiminished. The Germans, although not disabled, were compelled to meet an entirely unforeseen situation.

Battle of the Aisne. After the retreat from the Marne, the German armies ultimately halted and intrenched on a line which began south of Noyon on the Oise, followed the ridge north of the Aisne to the Reims-Laon road where it crossed the Argonne Forest and reached the Meuse north of Verdun. On Sept 10, 1914, Joffre issued an order for a coordinated pursuit of the retreating Germans. He believed that they planned to retire to the Meuse, but when the Aisne was reached every indication pointed to a halt on that river. The French and British crossed the Aisne west and east of Soissons respectively, but were unable to break the German line, which had been reinforced by a corps from Belgium and the besieging corps from Maubeuge which fell September 7.

First Battle of the Somme. When it became clear that the Germans could not be successfully dislodged from the Aisne, Joffre planned to outflank the Germans from the left bank of the Oise and force them to retreat from the Aisne. The greatest part of de Castelnau's II army was sent to the north of Paris to assist the left wing in carrying out this objective. The Germans, on their side, were determined to do the very thing the French were planning to do. They gathered reserve forces and, about September 20, a series of battles began around Lassigny and Roye, which were extended northward west of Péronne and ended with the left of Castelnau's army at Albert on the Ancre River. These battles lasted about 10 days, then the lines were stabilized. Bapaume, Noyon, Lassigny, Péronne and Chaulnes remained in the hands of the Germans but Castelnau succeeded in turning the continuation of the Aisne line northward instead of west along the Somme and therefore accomplished his object to some extent. The withdrawal of Castelnau's II army from Lorraine permitted the Germans to advance across the Moselle and capture the St. Mihiel salient, which they held

until they were dislodged by the Americans in 1918.

Battle of Arras. Castelnau's failure to outflank the Germans determined Joffre to make one more effort. This time he planned an advance through the valley of the Scarpe on either side of Arras in the direction of Douai. A new X army under General Maud'huy was organized for this purpose. General Foch was given the command of the group of French armies between the Oise and the English Channel. In the first week of October, Maud'huy's army advanced from Amiens and reached Arras, but found the Germans in front of it. He was unable to advance past this city. The French line was extended northward to the west of Lens, to the Lys River northwest of Lille. The Germans also extended their lines northward and occupied Lens and Lille. The lines became stabilized here and the second attempt to outflank the Germans failed.

British Operations South of the Lys River. In the latter part of September and early October, the British army was carefully removed from the vicinity of Soissons and railed up to the neighborhood of the English Channel where it would be closer to its base of supplies. After receiving reinforcements, including an Indian corps, the British, on Oct. 13, 1914, began to advance south of the Lys River. The advance stopped at Auber ridge about midway between Béthune and Lille. Another British corps advanced north of the Lys River and drove the German cavalry across the river. The British advanced as far as Armentières. The right was unable to advance on Lille and the left was unable to cross the Lys. Although severe fighting occurred in this region until the close of active operations for the year the lines were virtually stabilized by the 20th of October.

Battle of Flanders. The failure of the Allies to outflank the Germans was followed by an attempt on the part of the Germans to again outflank the Allies, and to secure if possible the Channel ports of Dunkirk and Calais. As a preliminary operation, it was decided to capture Antwerp. The siege began September 28; at first the Allies decided to attempt to hold it and British naval brigades were sent to reinforce the garrison; it was to be further reinforced by other British and French troops. In a few days, however, it became evident that it could not be held and preparations were made to withdraw the Belgian army to the west. The fortress fell on October 10 but the Belgian army retired in safety, its retreat being covered by a British division sent to Ghent from England. After the fall of Antwerp, German reserves were rushed to the Belgian front and established themselves on the Ostend-Courtrai line. The battle of Flanders was fought over such a long front that it really consisted of several detached battles rather than one large one. These several battles have been called the battle of the Yser, Dixmude, North of Ypres and South of Ypres.

The Battle of the Yser was largely fought by the Belgians. It started on the 18th of October when the 3d German reserve corps advanced to cross the river. The Belgians were strongly entrenched on the east bank of the river and their front was flanked by British monitors. The Germans did not reach the river until the 20th. On the night of the 21st, the Germans succeeded in bridging the river and by

the 25th had two divisions across the river. The Belgians retired two miles to a railroad embankment where they were reinforced by a French division. On the 30th the Germans captured Ramscapele on the railroad but were soon forced to withdraw when the Belgians flooded the terrain between the railroad and the river.

Dixmude was attacked by the Germans on the 20th of October but the attack was repulsed. On November 10, after a fierce bombardment of artillery and trench mortars the Germans finally captured the town. Its capture was of little importance, however, since the battle of Flanders was practically over.

North of Ypres, on October 19, the Germans fought their way across the Thourout-Roulers road checked by French cavalry until the main line held by French infantry was reached. Heavy fighting ensued up to November 10 but the Germans were unable to make any appreciable gain.

South of Ypres, the Germans advanced steadily but slowly until the 24th, when they were checked by the British. The attack was renewed on October 30 and November 1. These were critical days for the British army. It was attacked in force between the Menin road and the Lys River. The Messines and Wyt-schaete ridge was the objective of the German attacks. Messines was taken on October 31 and Wyt-schaete on November 1. The Germans felt that they had broken through the Allied lines. Strong French reinforcements were hastily brought up, however, and the final German attack on November 10 and 11 was repulsed all along the line with the exception of Dixmude, which fell into German hands. Minor operations continued until November 20, when the lines were consolidated for the winter. The battle of Flanders was now over and was the third serious check for the Germans on the Western front in 1914, the other two being the battles of Lorraine and the Marne.

Beginning of Trench Warfare. The conclusion of the battles of Flanders, Nov. 11, 1914, marks the beginning of what we may call the long siege of the armies over the whole line from the sea to the Swiss frontier. It was a time of ceaseless watching, of hardship and trial, of continuous fighting with neither side able to advance at the expense of the other. Local advantages gained first by one and then by the other adversary in no way affected the issue and indeed, as measured by the ground gained, would not be represented on an ordinary map. A word is perhaps not out of place in respect to the nature of the contest that now became the rule over the entire Western front. Trench warfare took the place of what now may be called old-fashioned operations in the open. Mining and countermining became the rule: the lines in reality were areas of parallel trenches protected by networks of barbed wire so thickly interlaid and interwoven that only long sustained artillery fire could break them down in clearing the way for assault. The troops lived in and under the ground so that shrapnel, the ideal man-killing projectile against troops in the open, proved nearly useless and was replaced by the high-explosive shell, able to pierce overhead shelter and overwhelm the occupants. Operations degenerated into a struggle of wear and tear, attrition. So close did the lines draw to each other that antiquated methods

and weapons sprang into new life; hand grenades, knives, and even clubs, for close work. Trench mortars came into existence. Asphyxiating gases, in violation of The Hague Convention, were used. Artillery took a position of first importance, as was but natural in a state of siege warfare. The reason of this state of affairs is to be found, in part at least, in the air service, which made surprise well-nigh impossible and allowed time for the threatened side to make ample preparations to resist any impending movement, and which also increased the efficiency of artillery by enabling batteries to correct their fire, and by discovering and assigning targets invisible from the batteries themselves.

Operation of 1915. The year of 1915 on the Western front was spent by the Allies in testing the German line at various points, in an endeavor to break through and prevent German troops from being withdrawn from the Western front to reinforce the armies operating against Russia. The Germans remained on the defensive, making but a single attack.

The British attacked with two corps at Neuve Chapelle with a view of reaching the town of Lille. This attack was made in the month of March but resulted only in taking the German advance line with heavy loss to the attacking troops. This was followed in April by the German attack on Ypres, where clouds of chlorine gas were first employed. It was only a partial success as the Germans were unable to reach Ypres, which was held by the British. The attack thus initiated lasted a month but without further German success.

In May, there occurred a combined attack by the British and French along the front between Neuve Chapelle and Arras. The British attack was made by three corps at Festubert and resulted in an advance of 600 yards over a front of four miles. The French attack was made by seven corps on a 10-mile front north of Arras; at one point the French troops advanced two and a half miles but a break-through was not secured. The struggle on this front continued on through June. These attacks occurred shortly after the Germans began their great advance against Russia.

In September, there were simultaneous attacks by the French and British on widely separated fronts. In the north the British attacked with three corps in combination with the French on the front where the French had attacked in May. The British objective was the mining town of Lens. The British almost attained their objective but were unable to hold it; they secured the neighboring town of Loos. The French on their right attacked with about seven corps, their objective being the ridge overlooking Lens, the Vimy ridge. They were, however, held up in the valley in front and succeeded only in taking the town of Souchez.

The great French attack in September, however, was made on a front of 15 miles in Champagne between Reims and the Argonne Forest. Here two armies were employed and the attack was preceded by a three days' bombardment by as heavy a force of artillery as the French could assemble. Under this fire the intricate system of trenches and wire entanglements became a perfect labyrinth through which it was impossible to advance in good order. As a result, the French were held up at the German second

line some miles in rear where fresh troops had just arrived from the Russian front.

During the year, the French made various attempts to force the Germans to evacuate the St. Mihiel salient but they met with little success. Minor operations also took place in the Argonne Forest and along the Vosges front. On the whole, it may be said that the lines established at the close of 1914 remained practically unchanged during 1915.

In 1915, the British forces on the Western front were greatly increased and at the close of the year the British front extended from the Belgian front north of Ypres almost down to Arras. The British were also prepared to place a third army in line early in 1916. This enabled the French to increase their reserve troops.

1916. Verdun. The offensives of 1915 were completely overshadowed by the battle of Verdun, which began in February, 1916. Von Falkenhayn, the German chief-of-staff, who succeeded von Moltke after the battle of the Marne, was greatly disturbed by the Allied offensives in September, 1915, which came so close to succeeding, and determined to forestall another Allied offensive by a German effort on a grand scale. After careful consideration Verdun was decided upon as the place of operations. For dynastic and political reasons the command of the attacking forces was given to the German Crown Prince.

Verdun was an entirely different place from the Verdun of the beginning of the War. Having profited by the fate of Liège and Namur, the forts at Verdun were held by light garrisons only and the French line was established about 10 miles to the north and east. Intermediate lines and positions covered the area between the fortress and the outer line of defense. The Verdun position was a salient about 45 miles wide across the neck which extended from St. Mihiel to the Argonne. Most of the salient was on the eastern side of the Meuse. Along the east bank of the Meuse there is a ridge—Côte de Meuse—five miles wide and about 400 feet high. To the east of the ridge and extending to the south is the plain of the Woevre, which in the spring is too soft for any operations. The French line crossed the ridge from the Meuse River and extended about five miles into the plain of the Woevre. The two trunk lines, which supplied Verdun before the War, Paris-Verdun and Paris-Verdun via Commercy, were under the observation and fire of the Germans in the Argonne and at St. Mihiel. A single-track narrow-gauge road from Bar-le-Duc via Souilly was the only railway means of supplying troops to Verdun.

The Crown Prince planned his main attack along the ridge from the north. If this were successful, the French would be obliged to evacuate their line in the Woevre to prevent capture and a secondary attack could be made along that point. Von Falkenhayn believed that an attack on Verdun would succeed because its inferior rail communications and the limited number of bridges across the Meuse would interfere with its reinforcement. The operation, which he estimated would take eight days, was to have its right flank protected by a later advance on the west side of the Meuse, which would protect operations on the east from French artillery on the west bank. The German Crown Prince had at his disposal nearly one-half million men, many of whom were completely rest-

ed and others of whom were picked "shock" troops. Besides these, many other divisions were held in reserve along other parts of the Western front in readiness for immediate transportation. Tremendous amounts of heavy artillery were concentrated with an unlimited ammunition allowance. Every request for labor and equipment was complied with.

The artillery preparation for the attack was begun at 7 A.M. on Feb. 21, 1916. It continued until 4 P.M., when the infantry moved out on a front of about 4 miles southward along the ridge. During the first period of the battle (February 22-March 4), the Germans, in a slow advance, covered by extremely heavy artillery fire, captured the 1st, 2nd and 3rd positions east of the Meuse and Fort Douaumont, the most advanced of the Verdun forts, five miles from the city. Joffre immediately sent troops of the II army then in reserve, and selected its commander Pétain to command at Verdun. These were to be followed by the X army from the Arras section where they were to be replaced by the IV British army.

General Pétain arrived at Verdun on February 26, and ordered a counterattack at once along the entire line. He divided the front into corps zones and assigned the artillery, which was arriving in great numbers, to the zones. The occupied ground was to be organized and held, and the forts to be reoccupied and rearmed. The number of bridges between Verdun and St. Mihiel was to be increased from 7 to 41. Pétain also organized a truck line of communication from Bar-le-Duc to Verdun, over which 3000 auto trucks passed every day. This saved the supply situation, and the French call the road "the Sacred Way." On March 4 the French were holding their fourth position, a series of ridges between Douaumont and Verdun.

During the second period of the battle (March 5-22) the Germans were unsuccessful in their attempts to advance their right wing west of the Meuse to Hill 304 and Dead Man's Hill, and their left wing from the Woivre plains, which had been evacuated by the French who established a new line on the east crest of the ridge around Fort Vaux. During the third period (March 22-April 30), the German Crown Prince suffered such losses that, by March 22, fresh troops were required. On April 9-10 he ordered a general attack along the whole line and captured the crest of Dead Man's Hill. This was recaptured by the French on April 20. Many local battles were fought during this period. During the fourth period (May and June) General Nivelle, who on May 2, had succeeded General Pétain in command of the Second Army and of the defense of Verdun when the latter was promoted to command an army group, carried out Pétain's policy of counterattacking on every possible occasion. The violence of the German attacks and the stubbornness of the French defense may be judged by the fact that although the Germans attacked Hill 304 from May 4 to 7, with more than 100 batteries of heavy artillery, they captured only the north part of the hill. Douaumont was recaptured by the French on May 22-23. On the latter date, the Crown Prince captured Dead Man's Hill and retook Douaumont. In June, he concentrated on the attempt to capture Forts Vaux and Souville. Fort Vaux was completely destroyed in the first week of June, and the struggle for Souville, which was really

the key to Verdun, became most desperate. Joffre forbade any retreat. The crisis of the attack came on June 22 and 23 when, after an unparalleled bombardment, the Germans reached the edge of Souville. On the next day Nivelle began counterattacks on a grand scale and by June 30 had driven the Germans beyond Fleury a mile to north. The next day, Joffre and Haig launched the battle of the Somme, with such force that von Falkenhayn was forced to withdraw troops from Verdun for the Somme, and to abandon the idea of an immediate capture of Verdun.

The struggle now became a deadlock. This continued until the latter part of October, when the French regained in three hours what it had taken the Germans months of effort to attain. This and subsequent actions are usually referred to as the Second Battle of Verdun. This three-hour action was the most brilliant action of the whole Verdun campaign. General Nivelle's artillery preparations were brief but of exceedingly great intensity; then came the infantry attack on October 24. The Germans were driven back and what remained of the forts Douaumont and Vaux was again in the possession of the French. During the next six weeks there were scarcely any infantry engagements and the artillery actions that occurred were of minor importance. On December 15, however, despite wintry conditions, Nivelle executed another great coup. He attacked on a front of six miles after a three-day artillery preparation. He succeeded in penetrating the German front for a distance of nearly two miles. The immediate general in command was Mangin.

After this advance the Verdun front once again became quiet, each adversary watching the other and being content to remain on the defensive. After 10 months of heavy fighting the Verdun struggle was virtually over. The total loss, including prisoners, dead, sick and wounded, was exceedingly great on both sides. In the last analysis, it was a great French victory. The moral effects on the French troops and French nation can scarcely be overestimated. The Verdun slogan "They shall not pass" was taken up as a battle cry all along the front and behind the lines. As a reward for his heroic work at Verdun, General Nivelle was made commander-in-chief of all the French armies, succeeding General Joffre.

First Battle of the Somme (Picardy). In his reports on this battle, Haig made the following statements:

"The principle of an offensive campaign during the summer of 1916 had already been decided by the Allies. The various possible alternatives on the Western front had been studied and discussed by General Joffre and myself and we were in complete agreement as to the front to be attacked by the combined French and British armies. Preparations for one offensive had made considerable progress, but as the date at which the attack should begin was dependent upon many doubtful factors, final decision on that point was deferred until the general situation should become clearer.

"Subject to the necessity of commencing operations before the summer was too far advanced, and with due regard to the general situation, I decided to postpone an attack as long as possible. The British armies were growing in numbers and the supply of ammunition was steadily increasing.

"By the end of May the pressure of the enemy on the Italian front had assumed such proportions that the Russian campaign was opened early in June, and the brilliant successes gained by our allies against the Austrians at once caused a movement of German troops from the Western to the Eastern front. This, however, did not lessen the pressure on Verdun. The heroic defense of our French allies had already gained many weeks of inestimable value and had caused the

enemy heavy losses; but the strain continued to increase. In view, therefore, of the situation in the various theatres of war, it was eventually agreed between General Joffre and myself that the combined offensive should not be postponed beyond the end of June."

The Allies proposed to attack on a front of about 30 miles in an air line in order if possible to effect a break through the German lines; this front was about equally divided between the British and French. The VI French army—Fayolle—was astride the Somme with the X French army—Micheler—on its right. Directly in front of the French armies, and five miles away, lay their objective, the town of Péronne on the east bank of the Somme. The ground in their front was generally level. The IV British army—Rawlinson—was on the left of the French, facing a ridge which rose between the Albert-Péronne and the Péronne-Bapaume roads. On the slope of this ridge, facing the British, the Germans had organized the position consisting of two strong lines about two miles apart; between the two lines were woods, villages, etc., strongly organized for defense. A third and even a fourth line had been begun still farther to the rear. The entire front was held by the II German army but after the attack began it was subdivided into two sectors, the I German army being organized in one of them.

The artillery preparation for the great attack began June 24 and continued for an entire week; the infantry attack was launched July 1. In the opening attack the greatest advance was made by the VI French army which broke through the German first and second lines and at one point advanced three miles by July 5; the British during the same period advanced their whole front about half this distance. Fresh troops were now brought up to reduce the centres of resistance between the two lines on the British front and by the middle of July on both fronts the Allies were ready for a second grand attack by which the VI French army advanced to the Somme River opposite Péronne but was unable to force the crossing; the British on their front broke through the German second line. It was now decided not to attempt any further advance of the VI French army south of the Somme but to move its reserves to the north of the Somme, where they were to be employed on the right of the British. From the middle of July until the middle of September, the British were engaged in the capture of the remainder of the German second line and the villages, woods and other strong points between it and the third line. About the middle of September, after a three days' artillery preparation, the German third line was taken. In this attack the British heavy tank was employed for the first time and met with considerable success. A fourth attack made about the end of September carried the last of the German prepared lines and the entire ridge was in the possession of the Allies. After September the attack died down somewhat but resulted in the straightening of the British front. About the middle of November, the weather conditions made further operations impossible.

According to Haig, who had been in command of the British army in France since the beginning of 1916, the British employed in this attack 45 of their 70 divisions on this front and the Germans reinforced their original 6 divisions

by 30 more during the operations. The Germans had been driven back over the entire front of 30 miles and on the British front to a depth of about seven miles. Although a break-through had not been secured, it was felt that the morale of the German army had received a severe blow by their failure at Verdun and the advance of the Allies on a front that had been made especially strong. Although the losses incurred in the great attacks on the Western front had been very heavy in all three armies, it was felt that the Germans would feel the losses much more than the Allies.

1917. Retreat of the Germans. After the close of operations on the Western front in 1916, the Allies were quite confident that the War would be ended in 1917. They were now greatly superior to the Germans in artillery, aircraft, and men. In a conference between Joffre and Haig, it was decided to forestall the Germans in 1917 and begin operations as early as possible. To prevent the Germans from shifting their reserves as they had previously done when an attack was delivered on a comparatively narrow front, it was now proposed to attack simultaneously along the entire front from Lens on the north to the Oise River on the south, in combination with a secondary attack by the French between Soissons and Reims. In December, however, Nivelle succeeded Joffre, and he made a new plan which Haig was directed by his government to support. According to this plan the French were to make the main attack between Soissons and Reims, and, to aid in this attack, the VI and X French armies on the Péronne front were to be replaced by British troops. The British, however, were to attack as previously arranged. The change of plan delayed the opening of the attack and enabled the Germans to secure the initiative.

In August, 1916, Falkenhayn was relieved as chief of staff of the German armies by Hindenburg, whose chief assistant was Ludendorff. In the winter of 1916-17, they decided that the Western front was too long for the available troops and decided to evacuate the Roy salient and fall back on a chord of this salient running from Arras on the north to the vicinity of Soissons on the south. The new line was carefully selected and fortified during the winter, it was called the Siegfried line but was known to the Allies as the Hindenburg line. The withdrawal of the stores began early in February and in the middle of March the troops began their retreat. To prevent the Allies from making an early attack on the new front, as the troops retired roads were blown up, and everything that could be of use or protection to the troops of the Allies was carefully destroyed.

As a result of this unexpected movement, the plan of the Allies had to be changed, as the new line was in places 25 miles in the rear of the old one. Before any serious attack could be made on the new line it was necessary to construct railways, repair roads, organize munition dumps, etc., all of which would take considerable time. The Allied attacks could no longer be made as planned over the entire front from Lens to Reims but had to be confined to the parts of the old German front that had not been evacuated. It was decided, therefore, to make an attack as soon as possible with the III British army assisted by the I British army on the German line in the vicinity of Arras, while the IV and new V British army organized

their position before the new German line farther south. Nivelle was to make his great attack as planned between Soissons and Reims but it was to be extended to the east of Reims. The British and French armies on the front of the Hindenburg line were to cooperate as well as they could, simply to prevent reserves being sent to the fronts to be attacked.

Battle of Arras. One of the reasons for the German withdrawal was to nullify any preparations the Allies had made for a spring offensive. This object failed of realization when scarcely a week later the British began an offensive on a 12-mile front north and south of Arras (April 9). Haig made long and minute preparations for the offensive. A continued aerial offensive gave him the control of the air. He also carried out a three-week wire-cutting artillery fire, interdicted the back areas, and for a few days preceding the attack laid down a terrific destructive fire, accompanied by extensive gas discharges; 4000 cannon were used in this preliminary work. Tanks were assigned to each corps to lead in the assaults. It was prescribed that halts for reorganization would occur only after the capture of each successive position.

On April 9 the British attacked on a 20-mile front. The I army under Hoiné advanced north of the Scarpe and the III army under Allenby advanced south of the Scarpe. On that day the Canadians stormed Vimy Ridge. The entire first line positions were captured in 40 minutes. The second positions were captured by noon. The third position presented greater obstacles, largely because the wire had not been effectively cut by the artillery. A gap had been made in the German lines but Haig failed to exploit his success and the probability of cutting the enemy's lines of communication was lost. Instead of sending the cavalry through the gap, Haig ordered the gap widened. This hesitation enabled the Germans to bring up the solely needed reserves and prevented a serious break-through. The British were greatly hampered in their operations which began in a snow storm, this was followed by rain which made the movement of artillery extremely difficult. After the opening attack which ended April 13 the attacking divisions were replaced and the operations were renewed but the original momentum was lost. The attack, however, went on until May 4, in order to prevent reserves from being sent to the French front when Nivelle's attack was going on. By May 5, Haig had advanced five miles on a front of 20 miles and siege conditions again obtained. The Germans had lost 15,000 prisoners and 200 guns. The result was to give the British the Vimy Ridge and its extension southward, which proved of great value when the Germans made their great attack the following year. Checked on this front, the British suddenly shifted their operations to the Ypres sectors.

French Offensive on the Aisne. After the retreat of the Germans to the Hindenburg line, General Nivelle had concentrated a force of 1,200,000 men (V, VI, X and IV armies) and 5000 guns in the Aisne area between the Oise and the Argonne. With this force he planned to attack the German front on a grand scale. The German front ran due south from the Ailette River to the Aisne at the junction of the Vesle and thence along the south bank for a few miles where the Germans had a bridgehead captured in the winter of 1914-15; thence the line crossed the river to the Chemin des Dames

Ridge (Ladies' Way, so called because it was built by Louis XV as a promenade for his daughters), between the Ailette and Aisne Rivers and along that ridge to Craonne. From Craonne the line ran southeast to some heights commanding Reims and thence over the Moronvillers ridge between the Suipe and Vesle Rivers to the Suipe. The attack was to be prepared by a long artillery bombardment.

The artillery began its operations on April 9, but the weather conditions were so bad that the infantry attack had to be postponed from the 12th to the 16th. Even then the weather conditions were unfavorable. Besides this, Hindenburg was fully cognizant of the French plans through the medium of captured despatches and had taken adequate means to fend off the French attack. He also withdrew the I army from the Hindenburg line and sent it to the French front. As a result, although the German lines were penetrated at various points along the front, only the first of the German lines could be captured and held on the Chemin des Dames Ridge and to the east. At the close of the first day it was evident that there was to be no break-through. Despite this Nivelle kept up attack until the 21st. In an intermittent battle lasting from April 17 until May 20, the French IV army east of Reims—Anthoine—succeeded in capturing the high ground of Moronvillers. On the night of May 4 the French captured Craonne, a key point on the Chemin des Dames, and by the next day captured the crest of the Chemin des Dames to the west and, to the east, the plateau of Craonne.

The French troops, after the initial defeat of April 16, considered success on the Aisne impossible. Units up to divisions in size, although asserting themselves to be loyal and ready, if necessary, to die for France, refused to continue the attack on the Aisne, on the ground that it was a useless loss of life. Although 20,000 prisoners and a large number of guns had been taken the French casualties amounted to about 120,000 and its general advance west of Reims had been slight. General Nivelle lost the confidence of his government by this gigantic failure and on May 15, Pétain succeeded him in command of the French armies, and Foch, who had been without any important duty since the preceding December became chief of staff at the War Department. Foch had been in command of the northern group of French armies since 1914 but this group was broken up when the VI and X armies were moved to the Aisne front.

British Operations in Flanders. The U-boat campaign had become exceedingly effective and as the principal base of these operations was Zeebrugge, the Channel port of Bruges, the capture of this port became a very important objective. Haig believed that this could be accomplished by land operations from the British front in Flanders operating from the Ypres front in the direction of Bruges. In June, 1917, when operations were begun on this front, the IV German army held most of the front from the Channel to the Lys River. In the north, its line was the east bank of the Yser River except on the coast where the Allies had a bridge-head on the east bank. From the Yser it followed the Ypres Canal almost to that town, which was held by the British. South of Ypres it held the Messines Ridge, which had been captured from the British in

1914. To strengthen its lines it had constructed a large number of concrete machine-gun emplacements called by the British "pill boxes."

Haig was given the I French army—Anothoine—to assist in his campaign and brought up the headquarters staffs of the IV and V British armies whose fronts were taken over by the III army. A new IV army was to operate along the coast and a new V army was to operate with the II army already on this front. While preparations were made to attack north and east of Ypres he directed the II army to capture the Messines Ridge.

This attack opened on June 7, 1917, when there occurred one of the most spectacular events of the entire war. This was the blowing up of the Messines-Wytschaete Ridge. This ridge formed a salient which dominated the entire Ypres sector from the south and which was literally a thorn in the side of the Allies. For over two years British sappers had been burrowing under this ridge and finally succeeded in placing in position, undetected by the Germans, 20 mines containing more than 1,000,000 pounds of ammonite. These were exploded by electricity on the morning of June 7. The whole tops of the hills were blown off and the roar could be heard for a distance of 150 miles. A tremendous shell fire which had been playing on the ridge for two weeks reached its greatest intensity as the mines were exploded. After the explosion the British infantry rushed forward and by the end of the day had wiped out the entire salient. The Germans retaliated for this Allied offensive by a successful attack on the British line at its most northern extremity in Belgium. On July 11, after heavy artillery preparation, the Germans made a strong infantry attack on the British positions east of the Yser River and captured the entire works. The preparations on the front of the main attack were made during the month of July but as the Germans had captured the bridgehead near the Channel the attack was confined to the front from Dixmude to the Lys River. In this opening attack the I French and the V and II British armies were to be employed. After a prolonged artillery preparation the infantry attack was then launched on July 31 and the Allied forces advanced about two miles, capturing the first and second German lines. A heavy rain now set in which lasted several days and made further operations impossible. The field of operations being generally flat, it was converted into an immense swamp over which movement was possible only on the few roads.

Some minor operations were undertaken about the middle of August by the V army that met with so little success that the commander of that army was relieved and the British front placed under the orders of the commander of the II army—Plumer. In the latter part of September the ground was again sufficiently dry to admit of another general advance and on September 20 the Allies again advanced about a mile. Then followed a succession of attacks with limited objectives carried on under very unfavorable weather conditions. The Allied objective was no longer the Belgian coast but only a ridge about five miles east of their original position; this ridge overlooked the ground to the east and in the possession of the Allies would make future offensive operations on this front practically impossible to the Germans.

Most of this ridge was secured early in November when the Canadians captured Passchendaele. This closed the operations.

According to Haig, in these operations the British employed two-thirds of their divisions in France one or more times and the Germans 78 divisions, 18 of which were employed a second and a third time after being withdrawn to rest and refit. The casualties on both sides were extremely heavy. As a strategic movement it was not a success but it did produce a great effect on the morale of the German army.

Verdun Again. On Aug. 20, 1917, after nine months of comparative quiet, the French resumed the offensive at Verdun. After a three-day bombardment they advanced on both sides of the Meuse and penetrated a mile and a quarter on an 11-mile front. In the next four days smashing blows were delivered which resulted in a further advance. By the 15th of September the French had recovered 100 square miles of the 120 the Germans had seized in their great offensive. They now held all the dominating positions in the Verdun sector and on the west of the Meuse the Germans were back in the lines from which they advanced in 1916.

Second Battle of the Aisne. On Oct. 23, the French X army—Maistre—launched a successful attack in the Aisne region. The attack was directed at the salient of the German line northeast of Soissons and just south of the Ailette River. The objectives were reached that day and immediately organized. The result of this attack was the abandonment by the Germans of the Chemin des Dames by November 2, and the retirement across the Ailette. This operation which was based on surprise, captured with comparative ease what Nivelle failed to capture with nearly a million and a half men. It worked marvels in the restoration of confidence and the rehabilitation of the French soldiers' morale.

Battle of Cambrai. While the British operations in Flanders were in progress, the commander of the III British army—Byng—had been preparing plans for an attack on new lines. The battle was to be a complete surprise without artillery preparation, a method untried up to this time in the War. The attack was to be led by a lone line of tanks followed by the infantry. Special preparations had been made to enable these tanks to cross the German trenches of the Hindenburg line which were here 15 feet wide and 9 feet deep. After the close of the operations in Flanders, Haig gave his consent to the attack but was unable to send enough divisions to hold the ground won by its unexpected success.

The attack was to be delivered on a front of about 6 miles between the Canal du Nord and the St. Quentin Canal southwest of Cambrai. A strong cavalry force was assembled in rear to be employed if a break-through was secured. On the morning of November 20, preceded by a barrage, 350 fighting tanks moved off followed by the infantry. The main and reserve lines of the German position were taken and on the second day the British were five miles in advance of their own lines fighting for a ridge which in their possession would have commanded Cambrai. Their force was too small to effect its capture and although other divisions were hurried up it was then too late. The cavalry was disappointed as the bridge

over which they expected to cross the St. Quentin Canal was broken down and the arrival of a German division from Russia closed this front. While the fighting was still going on in the captured area, the Germans hurried up reserves and on November 30 made a counter-attack across the St. Quentin Canal and recovered about half the area they had lost.

The battle of Cambrai established the value of tanks, and preparations were made both by the British and French to employ them on a grand scale in 1918.

Allied Unity. The prime ministers of France, Italy and Great Britain met at Rapallo, Italy, on November 9, and formed the Supreme War Council, which was to coördinate the military powers of the Allies and wage war as a unified group and not as individuals. The members of the Supreme War Staff were to be Generals Cadorna (Italy), Foch (France), and Wilson (British). According to the agreement, "The Supreme War Council has for its mission to watch over the general conduct of the War. It prepares recommendations for the considerations of the governments and keeps itself informed of the execution and reports thereon to the respective governments." General Bliss later became the American representative.

American Expeditionary Force. The first contingents of a United States army to fight in Europe arrived at a French port on June 26 and 27, 1917. They were commanded by Maj-Gen William L. Sibert and received a tremendous ovation from the French people. On the way over, the transports had been unsuccessfully attacked twice by submarines. Gen. John J. Pershing, the commander-in-chief of the American force, had been in France for some time preparing for the coming of the "Sammies," as the French characterized the American soldiers. Training camps for the American troops had been located in various parts of France and were ready for occupancy when the soldiers arrived. Infantry, artillery, aviation and medical bases were established. The number of men gradually increased, many of them stopping in England before going over to France. An intensive system of training was entered upon during the latter part of July. American officers were aided by officers and men of the British and French armies. The American transportation service took over transportation on all railways leading to American bases and a section of French forest was turned over to American lumbermen for the needs of the Expeditionary Force.

For the details of the actual raising, training, and equipping of the American army, see UNITED STATES and allied topics.

1918. Last Year of War on Western Front. The months of January and February, 1918, were months of comparative inactivity along the battle line from the North Sea to the Swiss border. The outstanding feature of the War at the close of 1917 was the signing of an armistice between the Central Powers on the one hand and Rumania and the de facto government of Russia on the other. The defection of Russia from the side of the Allies was the signal for a tremendous publicity campaign in Germany, predicting a gigantic blow on the Western front, which would completely crush the British and French armies before the American forces could land in sufficient numbers to give any substantial aid. The depression in

Allied countries caused by the abolition of the Eastern front was somewhat overcome by Allenby's victories in Asia Minor and the unexpected rapidity with which the United States rushed men and material to Europe.

The chief cause for the optimistic tone of the Teutonic press was the fact that huge quantities of material and a large number of men could now be transferred from the Eastern front for immediate service on the Western front. The German High Command adopted a policy of careful selection of the men who were to be transported westward. As a skeleton for the new division to be formed they picked out all the soldiers in Russia between the ages of 25 and 35. They realized that it would be impossible to withdraw all the men from Russia inasmuch as the Treaty of Brest-Litovsk provided for the occupation of a considerable amount of Russian territory by German troops. While it was generally known that the personnel and morale of the Germans on the Eastern front were considerably lower than on the Western front, nevertheless the German command hoped to build up from the Eastern material about 59 or 60 divisions of 12,000 men each. This would increase the fighting strength on the Western front by about 700,000 men and would bring the highest total of available men up to approximately 2,340,000. This total would approximately equal the number of men Great Britain and France had available. American, Belgian, and Portuguese troops practically assumed the Allies a numerical superiority over the whole front although not necessarily in any one sector.

On the Western front, during the first 10 weeks of the year the fighting consisted of a series of almost unending trench and aerial raids, carried out for the purpose of reconnaissance. Sometimes the trench raids would follow heavy bombardments, but generally speaking they were carried out by small patrols under cover of darkness. The Germans with varying success carried out raids in Flanders, Artois, Picardy, the Verdun sector, Champagne, and Lorraine, with the evident intention of ferreting out the weak points of the Allied line for the much heralded offensive on the Western front. The purpose of the Allied raids was to discover, if possible, the places on the German lines where any unusual concentration was being made. The aerial raids, to a large extent, were carried out over the valleys of the Rhine and Moselle Rivers, where it was known that the troops transported from the Eastern front were being refitted for service on the Western front.

The American troops, which had been pouring into France in an ever-increasing stream, and which had been gradually concentrating in camps in eastern France, were prepared to take over a section of the battle line. Pershing from the first had insisted on a distinctly American unit and had steadfastly refused to brigade the American troops with the British and French. The sector allotted to the 1st American division was about eight miles long and was on the southern side of the St. Mihiel salient, which had been established by the Germans advancing from Metz in 1914, and which had withstood several attempts on the part of the French to "pinch" it. Three French divisions were thus relieved for duty against the impending German attack. The Germans lost no time in trying out the new American forces by means

of heavy bombardments of high explosives and gas shells.

Second Battle of Picardy: The Somme Again. Shortly before 5 A. M. on Mar. 21, 1918, came the great blow which the German press and public had been so continually prophesying since the collapse of Russia and Rumania. The German plan was based on sound military strategy. It was to strike the Anglo-French line where the two armies joined, break through and reach the channel ports, and thus either confine the British, Belgian and Portuguese armies in the narrow region between the Somme and the Belgian border or drive them into the sea, and then turn their attention southward to the French armies, and make a direct advance on Paris. The attack was so timed as to offset any increase to the Allied force from the United States. The success of this scheme depended entirely on a complete break-through at the junction point of the British and French armies.

The front chosen for the attack was between the Scarpe and the Oise Rivers, and was held by the III British army under General Byng and by the V British army, under General Gough. The V army section of the battle line was taken over by the British from the French at the beginning of the year. The V army was composed of about 14 divisions, roughly 170,000 men, which had to protect a line about 50 miles long. It is difficult to understand why this particular section of the line was held so lightly. This entire front was attacked by a force composed of between 40 and 50 divisions, amounting to approximately 750,000 men, about 150,000 of which were concentrated between St. Quentin and La Fère. It is scarcely to be wondered at that the V British army was brushed aside by such a superiority of men, and by the dogged determination on the part of the Germans to get through at any cost. The German armies facing the battle line were under the supreme command of the Crown Prince of Bavaria and the individual armies, XVII, II, and IX, under the leadership of Von Bulow, Von der Marwitz, and Von Hutier. The plan of attack was drawn up by the last named general.

The weather favored the Germans to a very large extent. The attack was begun a little before 5 o'clock on the morning of the 21st under the cover of such a heavy fog and mist that it was impossible to see more than 100 feet ahead. It was preceded by a brief but very intense artillery fire which was composed mainly of high explosive and gas shells. Simultaneously a heavy artillery fire broke out in the Champagne and Lorraine sectors with the obvious purpose of preventing the bringing up of reinforcements to the vital places attacked. The Germans also bombarded Paris with a long-range gun placed in the forest of St. Gobain, approximately 75 miles away. This gun killed many civilians and did much material damage in Paris, but instead of causing a panic it seemed to renew the grim determination of the Parisians to carry on.

General Gough, commander of the V British army, knew from documents taken from German prisoners that the assault was impending and had made preparation to meet it, but his preparations were practically nullified by the weather conditions. The first line of defense, i.e. the outpost line, was taken before the Brit-

ish were cognizant of the fact that the attack had begun. The tremendous superiority of numbers forced the resistance line (second line) very quickly and enabled the Germans to rush up to the battle line or last system of defense. Here again the inequality of numbers ultimately told and the II and IX German armies forced their way through where some of Gough's division joined. Apparently the British had made no provisions for a break-through, because there were no defense lines behind the third defense system. The road to Amiens seemed open and only heroic efforts saved it.

The battle line of the German offensive extended from southeast Arras in the direction of Cambrai, as far as La Fère. The first infantry attack broke through the first and second lines of British trenches of the III army on a 16-mile front from Lagnicourt to just south of Gouzeaucourt. The result of this attack was evacuation of the British positions in the salient that remained after the battle of Cambrai at the close of 1917. On the 22nd, the Germans, after more heavy artillery preparation smashed through the entire British position along the whole front. The V British army was now completely cut off from the permanent French position before La Fère and the permanent British position at Arras. Between these two points there was a struggling mass of humanity with practically no organization as far as the Allies were concerned. It seemed certain that the German plan was to succeed and a permanent wedge inserted between the French and British armies. On the 23rd the British were defeated near Monchy, St. Quentin, La Fère, and opposite Cambrai, and the British second positions between Fontaine les Croisilles and Méuvres were penetrated. The Allies hoped to be able to hold the line of the Somme, but were unable to do so because no adequate defenses had been constructed there. On the 24th the Germans took Peronne, Chauny and Ham, and crossed the Somme River at various points south of the first mentioned place, by means of a pontoon bridge and rafts. The British were unable to completely destroy the bridge because of the haste with which they were withdrawing their artillery.

Continuing to advance on the 25th, the Germans captured Bapaume, Nesle, Etalon, Barleux, Biaches and Guiscard. On this day the French War Office announced that British lines south of St. Quentin and around Noyon had been taken over by a French army, thus showing that at last the Allies were making some successful attempts to stem the tide of invasion. On the 26th, the Germans crossed the old battle line of 1916 in several places and captured Noyon, Roye and Lihon. The 26th was the decisive day of the battle of Picardy. This day saw the closing of the gap caused by the break-through of the 21st. The French came up along the Southern front from the Aisne to the Avre, and west of the Avre, where they united with the British at Moreuil. The 26th also saw the organization of a temporary force under Gen. Sandeman Carey, who had received orders to close a gap made by the Germans. With rare judgment and skill he improvised an army from sappers, laborers, engineers, in fact anybody he could find, and with this cosmopolitan force faced the Germans, fighting over unknown ground, and with officers in charge of men they had never seen before.

A few words should be said here of the

method used by the Germans to relieve men who were exhausted by constant attacking or shot to pieces by the heroic British defense. Reserve divisions were kept directly behind the battle line and when advanced divisions needed replacement, the reserves were passed through the forward divisions and the latter were rested and reformed, and then they became the reserve. By this means the Germans were able to present continually fresh men to the British, who had been fighting without rest or relief since the tremendous offensive began. Another thing to be noticed about this battle was the ease with which the Germans were able to manoeuvre their attacking columns. The attack was made with three or four columns of several divisions each, and when they were stopped in one direction they were able to turn without loss of power in another direction. As most of the new ideas worked out in this battle were devised by Von Hutier, this plan of attack became known as the Von Hutier method. Many of its features were later adopted by the Allies.

The 27th saw the first perceptible signs of the slowing up of the German forward movement. The British, now reinforced, checked the Germans, and recaptured Morlancourt and Chipilly north of the Somme and advanced to Procy south of the Somme. These gains were offset, however, by the capture of Albert and the crossing of the Ancre River north and south of that city, and forcing the French back east of Montdidier. The 28th saw the fall of Montdidier but it also saw the complete repulse of a tremendous German attack on Arras. The artillery preparation was terrific and the Germans' orders were not only to take the city but Vimy Ridge also, at all costs. The Germans used about 20 divisions in the huge effort, and after suffering appalling losses which materially reduced their numbers, were compelled to give up the attempt after an all-day battle which equaled in intensity anything that the War had produced.

The German effort had now almost spent itself and the German High Command found itself caught in a rather difficult position. The Germans had pushed a 35-mile salient towards Amiens, which was quite narrow at its extreme tip. The northern side of the salient was bounded roughly by the Ancre River and the southern side by the Avre. These water barriers were, comparatively speaking, no protection to the Allies, but the high ground on the Allied sides was an ideal spot for artillery emplacements, which commanded all the German positions in the tip of the salient. The German problem was to break through the sides of this wedge and broaden the salient or face a possible disaster. The attempt at Arras, as has been noticed above, failed. During the first week of April tremendous assaults were made from Albert at the Ancre line on the north, and on the Avre line from Grivesnes to north of the Amiens-Roye road on the south. Although local successes were gained by the Germans, they failed in their main purpose, i.e. breaking the lines of the Avre and Ancre and widening the salient. The chief reason for this was the time element, which had permitted the British and French to bring up men and guns and thus stabilize their lines. Another contributory cause was the fact that a heavy rain had turned the Somme battlefield into a desolate sea of

mud, and hindered the Germans' transportation of men, munitions and supplies. The failure during the first week of April to smash the sides of the Amiens salient ended the battle. As to results, the main German plan was frustrated. The French and British were still united and held strong defensive positions. The Germans had taken practically all the ground they held at the beginning of the battle of the Somme in 1916, and some more besides, approximately 1500 square miles. Both sides suffered severe losses. A conservative estimate would place the German casualties at a quarter of a million men, while the Allies' were probably 50,000 less. Most of the Allies' losses were borne by the British.

Ferdinand Foch, Allied Commander-in-Chief. The terrific blow struck at the British army on the 21st of March, with the subsequent demoralization and almost complete defeat of the Allies, compelled them to take a step that up to this time they had been loath to take. That was to appoint one man as the leader of all the Allied armies. It is idle to speculate on what might have happened if this had been done previously, but many critics have stated that the great March disaster would have been avoided under a unified command. On Nov. 12, 1917, after creation of the Supreme War Council, Lloyd George said concerning it "... The Italian disaster necessitated action without delay to repair it. ... It is true we sent troops to Saloniki to succor Serbia, but as always they were sent too late. Half the men who fell in that vain effort to pierce the Western front would have saved Serbia, saved the Balkans, and completed the blockade of Germany. ... 1915 was the year of the Serbian tragedy: 1916 was the year of the Rumanian tragedy. ... National and professional traditions, questions of prestige and susceptibilities, all conspired to render our best decisions vain. ... The War has been prolonged by particularism. It will be shortened by solidarity." These words seem to point to a unified command but Lloyd George was compelled to go back on them because the British General Staff, which was opposed to the scheme, was too influential with the British public and Parliament. The move was characterized as an attempt to subordinate the military to the political leaders. The British felt that a French leader would not protect the British lines to the sea, and the French felt that a British leader would sacrifice Paris for the sake of defending the coast. But Allied failure on the Western front, such as at Cambrai, the collapse of Italy, and the colossal defeat just suffered by the British arms, converted the British public to Lloyd George's point of view.

From the time that the United States entered the War, President Wilson had argued unity of command as well as the pooling of all the resources of the Allies. When the Germans struck in March, General Pershing offered the small American forces in France to the Allies for use in any way they saw fit. This act on the part of the American commander finally overruled the last objections on the part of the British Staff. General Foch, whose ability, achievements, and popularity in the Allied countries, eminently fitted him for the task, was named Commander-in-Chief of all the Allied Armies. His first statement was an assurance that Amiens would not fall. In all the

countries involved he was heartily welcomed as the man of the hour by the press and the public.

Battle of Lys River. Possibly as a result of the Von Hutier idea of changing the direction of the attack or possibly as a result of the check they received before Amiens, the Germans suddenly launched an attack between the high ground north of Ypres and Arras with their IV and VI armies. The German Staff also estimated that the British armies defending these fronts were considerably weakened by the attack on Amiens. The main part of the attack was aimed between the first mentioned positions and La Bassée, astride the Lys River. A break-through of any size would seriously imperil the channel ports, inasmuch as the British had scarcely 40 miles to manoeuvre in. An advance similar to that before Amiens would have resulted in the capture of Calais, one of the chief bases of supply of the British armies. The chief objectives of the first German thrust were Bèthune, Bailleul and Hazebrouck. The last named place was a little over 15 miles from the starting-place, and if captured meant the fall of Ypres and the dislocation of the entire railway line behind the British and Belgian armies.

On April 9 the German armies struck at a portion of the line between Estaires and Bac St. Maur, held by a Portuguese division and smashed it completely, capturing Richebourceq-St Vaast and Laventie. This attack created a gap of about 3 miles in the British lines and through this opening German troops began to pour and spread out in ever-increasing numbers. On the 10th the Germans crossed the Lys River at several points between Estaires and Armentières, and launched a tremendous assault at the base of Messines Ridge. These movements caused the fall of Armentières. On the 11th the Germans launched an attack all along the front from La Bassée to the Ypres-Comines Canal and took Estaires and Steenwerck. The Germans, as in their previous offensive, were making rapid advances in the centre toward Hazebrouck, but were checked by the defense around the wings at Ypres and Arras. Unless one or the other of these wings could be pierced the German advance was bound to be stopped before it could reach its main objective at Hazebrouck. By the 13th the Germans were only 5 miles from Hazebrouck. The seriousness of the British position may be gathered from General Haig's statement to his troops on April 12, "Many among us are now tired. To those I would say that victory will belong to the side which holds out the longest. Every position must be held to the last man. There must be no retirement. With our backs to the wall, and believing in the justice of our cause, each one of us must fight to the end. The safety of our homes and the freedom of mankind depend alike upon the conduct of each one of us at this critical moment."

Although it appeared that the German offensive had slowed up on the 14th, on the 15th the Allies met with severe reverses. A terrific assault towards Bailleul and Wulverghem resulted in the capture of Bailleul, Wytchaete and Spanbraekmolen. On the 17th the Germans occupied Poelcappelle Langemarck, and Passchendaele, which the British were compelled to evacuate, in order to escape the dangers of a salient, the base of supplies of which was nearer

to the Germans than to the British themselves. The capture of Wytchaete placed the British positions around Ypres in a very precarious situation. Messines Ridge, on which this was located, dominated all the British positions in Ypres and overlooked the means of communication with that city. In order to prevent a serious catastrophe the British retired to a line that ran from Bixchoote to the neighborhood of Zonnebeke. By the 18th their positions were almost identical with those they held after the first battle of Ypres in 1914. The surrender of territory was a terrible blow to British morale and pride. The first and second battles of Ypres had made that city, in the eyes of all Englishmen, what Verdun was to the Frenchmen.

The Germans, checked for the time being in the north, made a heavy assault on Villers Bretonneux, southeast of Amiens, on the 24th. With the aid of a number of tanks, they captured the village. At the same time, just south of this, French and American forces were compelled to abandon an unimportant salient near Hangard, in the valley of the Luce River. Mount Kemmel, which seemed to be the only remaining key to the Ypres salient, was the scene of extremely bitter fighting from April 24 to April 27. The Germans, prodigal of men, made frontal and flank attacks on the positions, until by sheer weight of men and metal they compelled the Allies to relinquish the height, as well as the villages of Kemmel and Dra-noutre. Ypres did not fall as was expected because of the failure on the part of the Germans to capture Mont Rouge, Mont des Cats, Scherperberg, and several other hills that belonged to the same range as Mount Kemmel.

The second great German thrust was ended. It failed to accomplish its purpose, although approximately 800 square miles of French and Belgian territory were occupied. The significant fact that remained after these two German attempts to gain a decision was that the 15-mile front between Lens and Arras held. This prevented the Germans from broadening their salients and thus, in a sense, limited the depth of their penetration inasmuch as a narrow salient is constantly in danger of being "pinched."

Forcing of the Aisne and the Marne. The fact that the defensive around Arras, particularly Vimy Ridge, and around Ypres, particularly Mont Rouge, held against all assaults, forced the Germans to turn to the southern side of the Picardy salient and attempt to widen it there. Hindenburg would undoubtedly have preferred to attack the British army again, but as that would require a large amount of preparation, he decided to go through with his plans on the Aisne, in order to keep the offensive. A few days previous to the beginning of the battle of the Aisne heavy artillery fire in the Picardy and Ypres salients seemed to presage an attack in those localities. When the real direction of the attack was revealed and the Germans forced the Chemin des Dames positions and the Aisne River with comparative ease, many critics believed that Marshal Foch had been out-generaled and out-manoeuvred. Later events proved that he had adopted the best course of action, because, while he could doubtless have held these positions at great cost, he achieved far better results by permitting the Germans to advance in the centre while holding

them on the wings, thus placing them in a vulnerable position.

On May 27, the Aisne offensive began. As in the previous two, great concentrations of men and material were made by the Germans with comparative ease, and apparently without the knowledge of the Allies. A three-hour artillery preparation, composed mainly of gas, with a sprinkling of high explosives, preceded the infantry attack. The attacking force comprised 250,000 of the best fighting men in the German army. The British and French defenders consisted of between 50,000 and 75,000 men. The attack was on a 40-mile front from around Vauxaillon, near the Ailette, to Reims. The chief attack was near Craonne and its purpose was to outflank the Chemin des Dames, in case it could not be taken by frontal assault. The entire Chemin des Dames line was overrun on the 27th, and the Allies retreated across the Aisne between Vailly and Berry-au-Bac, a distance of 18 miles, in relatively good order. On the 28th, the Germans drove forward about 6 miles on a 9-mile front between Vauxaillon and Cauroy, took about 20 towns and villages, crossed the Aisne and Vesle Rivers and reached Fismes on the southern bank of the latter river. The Allies were falling back in the centre, but on the Reims side they held the Thillois-Savigny-Brouillet line which protected that city. An attempt was made to do the same on the western side to protect Soissons, but the line failed to hold. The same day also saw the end of the German assaults in the Ypres and Picardy sectors, which were intended to divert attention from the main battle. The Allies recovered their lines on the Lys-Ypres front east of Dickebusch Lake. The American 1st division took Cantigny, near Montdidier, after a brilliant assault, and held it against several strong counterattacks.

On the 29th Soissons fell after an extremely heavy bombardment of high explosive and incendiary shells. On the 20th the Germans continued their advance in the centre but were checked on the flanks. They captured Fère-en-Tardenois and Vezilly, and forced the Allies back on Reims, but in the south were held along the Soissons-Château-Thierry highroad. They succeeded in wiping out the salient south of Noyon from the Oise canal to Soissons. The 31st saw an 8-mile drive to the Marne, which was reached on a 6-mile front from Château-Thierry to Dormans. Attempts in the next few days to broaden this front, particularly in the direction of Epernay, were severely repulsed.

On June 15 the Germans began to widen this salient to the westward. They pushed 6 miles in that direction along the Ourcq, a tributary of the Marne. This drive brought them beyond Neuilly and Chony and reached Nouvron and Fontenoy northwest of Soissons. A heavy assault against Reims, with the intention of smashing the eastern side of the salient, was severely checked before it made any headway. The tide of battle was now slowly but surely swinging to the side of the Allies. Although the Germans had almost 500,000 men across the Aisne, General Foch, by calling on the British, French, American, and Italian reserves, presented at least an equal number to them. On the next day French counterattacks in force slowed up the German drive westward.

The German advance had now practically stopped and during the next few days, the

French, with the assistance of the Americans, not only stopped the Germans, but drove them back in the neighborhood of Château-Thierry. On June 6, Franco-American troops advanced nearly a mile in the vicinity of Veully-la-Poterie, and Americans took Torcy and Boursches, which they held against strong counterattacks. The subsequent activities of the Americans in this sector will be treated in the following section. On June 18, a terrific attack on Reims, carried out by 40,000 Germans, was completely crushed.

The German War Office announced that 45,000 prisoners and 400 guns had been captured; 650 square miles of territory had been occupied, and the Germans had advanced a maximum depth of 30 miles, and created another salient with a narrow tip, only 6 miles, along the Marne. No considerable strategical advantage had been gained, unless it be the fact that the Germans were now only 44 miles from Paris instead of 62. The price paid to gain what was merely a geographical advantage, was conservatively, 110,000 men, killed, wounded, and captured.

The Offensive Against Compiègne. The battle of the Aisne and Marne left the Germans in a very precarious position. The salient had to be widened, strongly fortified, or else abandoned. The line from Château-Thierry was in the shape of a huge crescent with the bend facing towards the Germans. The German plan was to link up the Picardy salient with the Marne salient and thus wipe out the huge bulge in their line and to capture Compiègne, Compiègne Forest, and Villers Cotterets Forest and then use the first mentioned place for a direct attack on Paris. The capture of Compiègne was considered absolutely necessary because of the insufficient line of supplies for the troops in the Marne salient. The capture of Compiègne would open up the Liège trunk line and solve the problem of supply. The river valleys of Aisne, Oise, Marne, and Ourcq would then be available for a converging attack on Paris, the nerve centre of France. The strategy of the offensive was sound but its execution failed. In five days the Germans suffered one of their most ghastly failures of the entire war. The offensive lacked the element of surprise, which, undoubtedly, was the chief cause of the initial successes of the earlier offensives. The French command had made a minute survey of the field and placed artillery and machine guns in such position as to enfilade all avenues of attack. They also made provisions, in case of initial German successes, to check their forward movement on second and third defense lines, as carefully prepared as the first. The French plan was to hold this front line lightly and resist the enemy on the combat lines, which were out of range of the German light artillery.

The attack was preceded by a heavy artillery attack, again mainly composed of gas, which lasted from midnight until 4:30 in the morning of the 9th of June when the attack began on a 20-mile front from Montdidier to Noyon. As in the previous battles the Germans advanced in the centre but were held on the flanks. The total advance on the first day was 2½ miles and was only attained after frightful losses. The French made a heavy counterattack on the very first day between the Oise and the Aisne, which showed that the forces on both sides were nearly equal. On the next day the Germans

advanced about 3 miles farther and captured, after extremely bitter fighting, Mery, Belloy, and St. Maur. The German penetration was now about 5 miles and this was approximately the depth of their entire advance.

On the third day the Germans were compelled to bring up fresh divisions and, with their aid, reached the Aronde River, a small stream on the western side of the battle line. They also advanced a mile along both banks of the Matz River and almost reached its junction with the Oise on its northern bank. On the eastern end of the battle line, Ourscamps Forest was enveloped. This day was the turning-point of the battle, because before it was over, two French counterattacks had driven the Germans back between Ribescourt and St. Maur, and recaptured Belloy, Senlis wood, and the heights between Mortemer and Courcelles. On the next day the French gained further ground between Belloy and St. Maur. The Germans forced a crossing of the Matz, but on the 13th the French again counterattacked in force and drove the Germans back across the Matz. This ended the German offensive which resulted in the using up of over 300,000 German troops and the actual putting out of action of 80,000. No strategic advantage was gained.

A word should be spoken here of the activities of the Franco-American troops in the neighborhood of Château-Thierry. On the 10th, American marines moved forward in the Belleau Wood and by the next day had captured all of it. The Americans also crossed the Marne on scouting expeditions.

Second Battle of the Marne. On July 15, Ludendorff opened his fifth and what proved to be the last German offensive of the year. It also proved to be the last German offensive of the War. It was under the personal direction of the German Crown Prince and was called "Friedensturm" (peace offensive). The whole line attacked was roughly 60 miles long and extended from Château-Thierry to Dormans, around Reims, and then east almost to the Aigonne Forest. It is estimated that the German Crown Prince had more than 800,000 men available for this "peace offensive." The plan of attack was to encircle and capture Reims by taking the Reims mountains, and also to get control of the railway centre of Epernay, which would compel the French to give up the entire Champagne line, which was very strongly fortified, and thus leave the centre in a very vulnerable position. The capture of Reims would also solve the supply question of the overextended Marne salient.

The attack began at 6 A. M. on the 15th. The first blow was aimed at the Americans on both sides of Château-Thierry. The Germans crossed the Marne in June southeast of Château-Thierry between Fossay and Mezy, compelling the Americans to retire on Condé-en-Brie. Here a counterattack was immediately organized, which drove the Germans back across the river and left 1500 prisoners in American hands. On other positions of the front the Germans were more successful. They crossed the Marne east of Dormans and advanced astride it in the direction of Epernay. At Bligny, southwest of Reims, they penetrated positions held by Italian troops and thus threatened to get in the rear of Reims. Southeast of Reims, the Germans made a fierce attack east of Prunay, with the idea of squeezing out the city, in conjunc-

tion with the advance at Bligny. General Gourand's IV army put up a magnificent resistance and held the Germans to very slight gains after inflicting appalling losses on them. The 42d American division formed part of this army. On the 16th and 17th, further attacks against the American forces were checked almost before they had started, but the pockets around Bligny and Prunay, southwest and southeast of Reims, respectively, were deepened. Everywhere else the Germans were held or driven back by counterattacks. The distance across the base of the Reims salient was scarcely 10 miles, which shows the critical position of this Allied bulwark. It is estimated that the Crown Prince in this "peace offensive" used 400,000 men, just one-half of those available, and that at the end of three days one-fourth of those employed were on the casualty list.

The Allied Offensive. The great German offensive begun in March was finally terminated on July 17 and the Allied counteroffensive began on the following day. In this counteroffensive there were two distinct periods although the fighting was practically continuous. The first period was that covered by the operations that ended in the compulsory retirement of the Germans not only from the three great salients made by the advance of their armies in 1918—the Marne, Somme and Lys salients—but also from the St. Mihiel salient captured in 1914. This period ended about the middle of September. This was followed by the final campaign in which the Allied armies advanced in practically a continuous line from the Channel to the Meuse River, it ended with the Armistice. This period began about the 25th of September and ended November 11.

Marne Salient. As early as June 1, General Pershing saw that the Marne salient was inherently weak, and suggested to Marshal Foch an immediate attack along the western face toward Soissons. Marshal Foch was strongly impressed by Pershing's plan but determined to wait until he had a preponderance of force. By the middle of June a plan for a counteroffensive, drawn up by General Pétain, in conference with Generals Fayolle, Mangin, and Degoutte, had been approved by Marshal Foch. While the Crown Prince was attempting to encircle Reims and cross the Marne the details were being worked out. The plan was to strike on the western side of this salient along the line between Soissons and Château-Thierry. The preparations for this counterattack were kept very secret. Vast quantities of supplies were stored up in the Villers-Cotterets forest, which lent itself admirably to the purpose. Great numbers of men of the army of manoeuvre (the existence of which the Germans doubted) were concentrated in the ravines and valleys of this forest without detection by the enemy.

The Allies attacked on July 18 on a 28-mile front from Amblény, west of Soissons, to Bouresches northwest of Château-Thierry. The attack was made without artillery preparation, the advancing infantry being protected by large numbers of tanks and a creeping barrage. It was made by Franco-American troops, the latter being most prominent in the Soissons and Château-Thierry regions, actually being the spearhead of the attack in the former place. The blow took the Germans completely by surprise, and, as a result of it, and the vulnerability of the German lines, the Crown Prince and his ar-

mies were driven across the Vesle. The hinge of the entire German retreat was the high ground around Chaudon, southwest of Soissons. The first push netted the Allies a 6-mile advance to the Crise River, which runs around the Chaudun plateau and which joins the Aisne at Soissons. This brought General Mangin and his Franco-American force to within a mile of the city, but the German High Command continued to hurl in fresh divisions in this vicinity, which effectively prevented the retreat from becoming a rout. The Allies also advanced from 2 to 3 miles astride the Ourcq, and the whole German line from Soissons to Château-Thierry began to retreat. Assaults carried out by British, Italian, and French troops, along the line from Château-Thierry to Reims won initial success but were unable to make a breakthrough similar to that on the western side.

Château-Thierry was evacuated on the 21st and on the same day Franco-American troops crossed the Marne and advanced 4 miles toward the Ourcq. By the 23rd the entire Soissons-Château-Thierry highroad, with the exception of a small portion south of Soissons, was in the hands of the Allies. On the eastern leg of the salient the British and Italian troops achieved local successes, but were unable to make a hole big enough to threaten the rear of the enemy. They did keep many German divisions actively engaged which might otherwise have been used to stem the Allied advance. On the 24th the Franco-American forces advanced 2 miles north of Château-Thierry and the British penetrated the German lines in the neighborhood of Vrigny on the eastern leg of the salient. On the next day the Germans made a heavy assault against the eastern leg, with the hopes of widening the salient, but they were thrown back everywhere. On this day the French captured Oulchy, and, together with the Americans, occupied 40 square miles of territory. After a week of severe fighting, the Crown Prince was using every effort to extricate his armies in the best possible shape out of a salient of which the neck was scarcely 20 miles wide. A German counter-offensive or another attack against Ypres which Hindenburg had planned for August, were out of the question.

By the 27th the Germans were in full retreat and on the 28th they abandoned the line of the Ourcq. On the eastern side of the salient the Allies crossed the Reims-Dormans highway after bitter fighting. This threat to completely crush the Germans resulted in severe fighting in the vicinity of Vrigny and St. Euphrase. The advance to the Vesle River was marked by extremely heavy fighting between the Prussian Guards and American forces at Sergy and Seringes. The former place changed hands nine times and the latter five before remaining in the hands of the Americans. On the 31st, the Germans made bitter but unsuccessful efforts to keep the Americans from Nesles forest. On August 1 the Allies struck on a 10-mile front north of La Fère, penetrated 2 miles, captured the height north of Grand Rozoy, and advanced to Cramoisselles. This effectively broke the hinge around Soissons and enabled the French to enter the city on the 2d after bitter street fighting. The advance on the 3d was 6 miles deep in some places and recovered more than 50 villages, the most important of which was Fismes. The Germans were now completely behind the Aisne-Vesle line and made desperate at-

tempts to hold the north bank of the latter river with the aid of the heavy artillery on the far side of the Aisne. The results of the first Allied offensive of the year were enormous—35,000 prisoners and more than 500 guns were in Allied hands. The Germans at home, as well as in the field, were convinced that their armies were not invincible. On the other hand the morale of the Allies was considerably heightened both by the German defeat and the spirited fighting of the American soldiers.

Somme Salient. On Aug. 8, 1918, Marshal Foch struck his second great blow. In many ways it resembled the Marne offensive. His aim was to "pinch" the overextended salient in Picardy, reaching out toward Amiens. He was making his plans and preparations for this attack while the offensive was being carried out on the Marne. The immediate objective was the railroad running from Péronne to Roye.

The attack was on a front approximately 30 miles long from Amiens to Montdidier. Later this front was extended all the way to Soissons. The element of surprise was entirely with the Allies. The Allied aircraft, artillery, and tanks, worked in complete harmony with the infantry. The British IV army, under Rawlinson, struck the Germans, under von der Marwitz, before Moreuil, and, in three days, drove them back 15 miles in some places and an average of 10 miles along the entire line. Most of the advance was on the plateau just south of the Somme River. During this time the French I army under Debeney, who were supporting the right of the British, crossed the Avre River in the face of an extremely destructive artillery fire and wiped out strong enemy positions, which threatened to outflank Rawlinson's advance. When he had accomplished this, he and Rawlinson began a concerted advance in the general direction of the Hindenburg line. By the 18th the Germans had retreated to the Albert-Chaulnes-Roye-Lassigny line and had lost most of the Lassigny plateau. On the 13th the French struck between the Oise and the Matz Rivers and captured Canny-sur-Matz. This blow also threatened Noyon, since that place was dominated by the artillery along the banks of the Oise.

On August 20 Mangin, with the aid of American troops, launched an offensive from the Oise near Ribecourt to the Aisne near Soissons. This was a part of Foch's plan to keep the whole line in action so that the German High Command would have great difficulty in bringing up reserves. Probably it was the activity of the Franco-Americans from Montdidier to Reims that enabled the British to make such huge strides to the Hindenburg line without suffering severe losses. The object of Mangin's blow was to secure the control of the plateau between the two rivers. Ten thousand prisoners fell into the hands of the Franco-American troops. On the same day Lassigny fell and the Germans evacuated Ourscamps Forest. On the 23d, the French advanced 7 miles along the front from Lassigny to north of Soissons. They captured several villages and crossed the Ailette River. On the 23d the III French army crossed the Divette River, near Avricourt, and General Mangin's X army crossed the Oise River and the Oise Canal at Manicamp 8 miles east of Noyon and reached the outskirts of Morlin-

court, which seriously threatened the entire Noyon salient.

Roye fell on the 27th, Chaumes on the 28th, and Noyon on the 29th. The operation which resulted in the capture of Chaumes drove forward 8 miles and made it certain that the German retreat could not stop short of the Hindenburg Line.

On the 30th, Mt. St. Siméon northeast of Noyon was completely occupied and the Franco-Americans captured Juvigny, a small town north of Soissons, which was of great strategic importance because it controlled the Juvigny plateau. The entire line of the Roye-Noyon-Soissons railway was now in the hands of the Allies. During the next five days the Franco-Americans saw bitter fighting, but nevertheless made advances of an extremely important nature. They gained a strong foothold on the Soissons-St. Quentin highway, by the capture of Terny-Serny. In conjunction with this advance on and from the Juvigny plateau the French made rapid progress up the Ailette River and captured Crecy-au-Mont and Leury (September 1). The result of this drive between the Oise and the Aisne in the neighborhood of Soissons was to outflank the German positions on the Vesle. Consequently, on September 4, the Germans began a hasty retreat on a 20-mile front from the river, setting fire to ammunition dumps and other supplies that they could not take away with them. Their retreat was covered by the heavy artillery on the north bank of the Aisne and the Chemin des Dames. Franco-American troops forced a crossing of the Vesle on the first day of the retreat. By the eighth, the Allied troops were fighting around Villers-en-Prayères and Revillon. By the middle of the month the Germans were everywhere thrust behind the Aisne in this region as far as Vailly. The French now began preparations to make a direct assault on the St. Gobain forest and the western end of the Chemin des Dames. Laon could be seen in the distance.

In the meantime, the other French armies operating just south of the Somme River were making rapid strides toward the Hindenburg line. On September 4 the French gained northeast of Noyon and forced the Germans to beat a hasty retreat over the territory between the Canal du Nord and the Oise. On the 6th, Ham and Chauny fell and the French advanced 6 miles in some places east of the Canal du Nord. During the next few days they made slow progress astride the Oise in the direction of La Fère. When the fighting slowed down the French and Americans were practically in the positions held by the French before the Hindenburg line previous to the huge offensive of March 21.

The beginning of this section related that Rawlinson smashed the southern side of the Amiens salient by striking from Albert to Montdidier. Foch gave the Germans no rest. After Rawlinson's blow had exhausted its possibilities, he hurled Byng's III British army north of the Somme and took Bapaume, and when this blow exhausted possibilities he hurled Horne's I British army astride the Scarpe and actually broke the Hindenburg line, besides threatening Cambrai and Douai.

On August 21, Byng struck on a 10-mile front from the Ancre River to Moyenneville and took seven villages. In the course of the next day's fighting the British captured Albert, after bit-

ter street fighting, and advanced 2 miles on a 6-mile front. A similar gain was made the next day from Bray to the vicinity of Grandcourt, which resulted in the seizure of nine villages and an imminent threat to outflank Bapaume. On the 24th, the British captured Bray on the Somme, 10 other towns and the famous Thiepval Ridge captured by the British in the Somme drive of 1916. The British swept on despite stiffening resistance and the utter disregard with which the Crown Prince of Bavaria hurled his reserves into the fray; 12 more villages and the Albert-Bapaume highway were seized on the 25th. After steady pressure the Germans were compelled to give up Bapaume on the 29th, and to begin a retreat along the whole line southward to Péronne and Brie on the Somme. Two days later the Australians in a brilliant assault stormed Mt. St. Quentin and Feuillancourt. The former position is the key to Péronne and this city fell on the first of September, along with Bouchavesnes and Rancourt.

The interest of the drive toward the Hindenburg Line now centres in the advances made by Horne's army, which struck astride the Scarpe, when Byng's forward movement began to slow up. Nevertheless it was the success of Horne's push that made Horne's attack possible. Horne's blow was tremendously successful because it not only broke the Hindenburg line at its northern end but broke the famous Drocourt-Quéant switch line as well. The very first day of the new drive, August 26, saw the piercing of the Hindenburg line. The Canadians captured Wancourt and Monchy-le-Preux. On the next day they smashed through the Hindenburg line for 4 miles southeast of Arras and occupied Cherisy, Vis-en-Artois, and the Oise River just south of the Scarpe. On the 28th, the Germans lost Croiselles and the Canadians took Boiry and Pelves behind the Hindenburg Line. Bullecourt was reached on the 29th, and the British were face to face with the Drocourt-Quéant line which had held them up in their Cambrai offensive at the end of 1917 (see *supra*).

The Drocourt-Quéant line was a very formidable line of defense intended to be a second barrier to the great passes at Cambrai and Douai. It branched from the main line at Quéant and then ran almost parallel to it to Drocourt. The British attacked it at 5 o'clock on the morning of September 2, under the protection of an extremely heavy barrage fire. In their first attack the British penetrated 6 miles of the line to a depth of 4 miles. During the second day the British having broken the line, penetrated 6 miles along a front of more than 20 miles. Quéant was taken by storm, along with dozen towns and villages. More than 10,000 prisoners fell to the British in this one operation.

They now set down to a slow but steady advance along the Bapaume-Cambrai road. It might be added here that Lens was evacuated by the Germans on September 4, but the Allies were unable to occupy it immediately because it was saturated with poison gas. By the 12th, Havrincourt, Evres, and Trescault were in their hands, and the threat toward Cambrai increased.

Lys Salient. In order to save the Crown Prince of Bavaria's army from an overwhelming defeat similar to those suffered during the "pinching" of the Marne and Picardy salients, the German High Command determined to withdraw from the overextended salient south of Ypres. This withdrawal was accelerated by short, sharp blows by the British. The first retirement was in the neighborhood of La Bassée on August 5. This movement was followed by an attack on the Lawe River which advanced more than $\frac{1}{2}$ mile on a 5-mile line. Two days later the British made an advance between the Lawe and Bourre Rivers which penetrated 2000 yards and occupied five villages, including Locon. Haig then struck due west of Armentières, between Bailleul and Vieux-Berquin, and captured Outtersteene. These attacks were made on the side of the salient and besides joining almost all of its area, placed the tip pointing toward Nieppe Forest, in a serious position.

Merville, almost at the tip of the salient, was entered on August 19, after an advance by the British on a 6-mile front. On August 30, the Germans evacuated Bailleul, and the next day the famous Kemmel Hill. Haig had planned to take this hill by assault with the aid of the American divisions, but the German withdrawal forced him. The British on the same day advanced along the Lawe River on the southern leg of the salient. On September 2 American troops north of Wyttschaete were thrown into battle and captured Voormezele, while the British were taking Neuve Eglise and some territory east of Estaires. Early in September the IV and I German armies were ordered to evacuate the Lys salient to economize troops.

St. Mihiel Salient, and the American Army.

By September 12, Foch realized that he had exhausted the possibilities of further immediate advance against the Hindenburg line. Instead of resting, which of course, would permit the German to rest also, he hurled the American army against the St. Mihiel salient, and reduced it, confronting the Germans with the necessity of defending Metz and the Briey iron fields in the salient, enclosing the Woëvre plain, and its tip extending to the Meuse, had existed since the first year of the war. One of the most important results of Pershing's successful offensive was the freeing of the great railway system running through Verdun, Toul, and Nancy. It was the loss of this railway that greatly hampered the bringing up of reserves during the Crown Prince's tremendous assaults on Lun.

Pershing was able to form his distinctly American force only with the greatest difficulty. The Allied attitude from the beginning had been one of absorption. France and Great Britain and even Italy rested that the American troops be used to reinforce Allied troop units. General Pershing stoutly insisted on the foundation of an American army which should be thoroughly trained in open warfare and deliver an American blow against Germany on a definite front. After considerable argument and many conferences Pershing finally won his point, and as the next step he organized seven army corps. The American army was formed on the Vesle front, but it was secretly transferred to the Woëvre front with headquarters at Neufchâteau. It was given the mission of reducing the St. Mihiel salient by

Foch, at Bombon, on July 24. General Pershing took command of the army himself.

Pershing's general plan was to make a feint toward Belfort, and then in a surprise attack strike at both sides of the salient and advance to the centre while carrying on a holding engagement at the nose of the salient. The battle order from left to right was as follows:

The Southern Force. The American 1st Corps (General Liggett) with right near Pont-à-Mousson, had divisions on the line as follows: 82d (Burnham), 90th (Allen), 5th (McMahon), and 2d (Lejeune), with the 78th (McRae) in reserve. The American 4th Corps (Dickman) with right joining the left of the 1st Corps had divisions on the line as follows: 89th (Wright), 42d (Menohor) and 1st (Summerall) with the 3d (Buck) in reserve.

Central Force (French) The French 2d Colonial Corps (Blondlet) with right joining the left of the American 4th Corps, had French divisions in the line as follows: 39th, 36th, and the 2d Cavalry division (dismounted).

The Western Force. The American 5th Corps (Cameron) with the right joining the left of the French 2d Colonial Corps, had divisions on the line as follows: 26th (Edwards), 4th (Hines), and the French 15th.

The west of the line was near Watronville. General Pershing held the 35th and 91st Divisions (Traub and Johnston) in rear of the western face of the salient, in reserve, and a general reserve consisting of the 80th Division (Cronkhite) in rear of the western face and the 33d Division (Bell) in rear of the southern face.

The chief attack was made on the southern leg on a front extending about 12 miles due west of Pont-à-Mousson. The attack on the western leg extended for a distance of about 8 miles from between Dommartin and Fresnes. Simultaneously with these attacks the French destroyed the bridges over the Meuse River at St. Mihiel. The attacks were made at 5 A.M. on September 12, after about four hours' artillery preparation. Foggy weather aided the attackers. The chief resistance was in the west, where the German positions were defended by the heights on the edge of the Woëvre plain. The Americans stormed these heights, the highest of which is Les Eparges, and took the villages of Herbeuville, Hattonchâtel, Hanonville, Bully, St. Maurice, Thillot, and Hattonville, and during the night entered Vigneulles, which is at the southern end of the line of hills protecting this side of the salient. On the southern leg of the salient the results were just as successful to American arms, and were carried out with the same precision. During the first day Labayville, St. Baussac, Vilecy, Essey, and the important town of Thiaucourt were captured. During the night Pannes, Nonsard, Buxières, and St. Mihiel were captured. Twenty-seven hours after the attack began, the forces advancing from the east and west met at Vigneulles and Heudicourt, and the St. Mihiel salient was no more.

During the next few days the pocket was "mopped up" and the new lines consolidated; 16,000 prisoners, among whom were some Austro-Hungarians, and almost 450 guns were taken. Besides these, vast stores of ammunition, arms and military supplies were captured. Nearly 175 square miles of territory and 70 villages were delivered from the enemy. The

Allies were now in a position to seriously threaten Metz and the great Metz-Mézières trunk railway, one of Germany's main supply lines. Another important result, for the Germans as well as for the Allies, was to show that the American forces had reached a stage of development where they could be depended upon to take their full share in the War.

What might be called the first period of the Allied offensive was now over. The result was everywhere favorable to the Allies. With the exception of the Aisne region, the Germans were back at their starting-place in March. The German people at home, although somewhat buoyed up by false reports, had lost their supreme faith in the army. Vast quantities of supplies and ammunition were captured or destroyed to prevent capture. Eight German divisions had been destroyed since the beginning of the Allied offensive up to the middle of September. Approximately 200,000 prisoners and 2300 guns had fallen into Allied hands. Almost 300,000 fresh American troops were pouring into France a month. Ludendorff's attempt to retreat to a smaller front was frustrated by Foch's tactics, the fundamental theory of which was to keep the enemy engaged all along the line and not to let him effectively use his reserves. This was the principle of exhaustion and is strikingly similar to Grant's campaign which won the Civil War.

Argonne-Meuse Offensive. As has been related above, Marshal Foch, in the last week of September, began an offensive over the entire front from Switzerland to the sea. He attacked the German right in Flanders, the centre along the Hindenburg line, and the left between Reims and the Meuse River. From the strategic point of view, the German left was by far the most important front. A break-through of any size here would cut the lines of communication between Germany and her armies in France and Belgium. The Argonne-Meuse line was also the hinge of the German retreat in Belgium and northern France, and, if broken, would doubtless cause a huge débâcle. The German defenses on this region, both natural and artificial, were exceptionally strong. The bend in the Aisne, west of the Argonne Forest, the forest itself and the Meuse River, were tremendous natural advantages; the German High Command, realizing the strategic importance of the sector, had placed many of its best divisions there, as well as profusely sprinkling the area with barbed wire and machine-gun emplacements.

After the fall of the St. Mihiel salient, which really paved the way for this offensive, the American army took over the lines from the Argonne Forest and the Meuse River. This army was to cooperate with Gouraud's 1st French army, which extended from the neighborhood of Reims to where it joined the Americans in the Argonne. For the opening attack in the American sector General Pershing employed three corps. *Left* 1st Corps (Laggett), which contained the 77th, 28th, and 35th divisions, with the 1st division in reserve. *Centre*, 5th Corps (Cameron) which contained the 91st, 37th and 79th divisions, with the 3d division in reserve. *Right* 3d Corps (Bullard) which contained the 4th, 80th and 33d divisions, with the 32d division in reserve. The general reserve included the 29th, 82d, and 92d divisions. Pershing stated "About 2700 guns, 189 small tanks,

142 manned by Americans, and 821 airplanes, 604 manned by Americans, were concentrated to support the infantry. We thus had a superiority in guns and aviation and the enemy had no tanks. The French and Americans hoped to advance on either side of the Argonne and squeeze the Germans out of the Argonne. They were unable to do this in the first attack as they were temporarily held up by German second positions."

First Phase. The preliminary bombardment began at 11 p.m. on September 25 and at 5 30 A.M. on the 26th of September the infantry attack was launched. The French advanced 4 miles and the Americans about 6. By the 28th the Americans had taken Montfaucon, Evremont, Garcourt, Cuisy, Septsarges, Malancourt, Ivoiry, Epunonville, Chaupentry, Very, and 10,000 prisoners. The French took Sevron, the Butte des Mesnil, and Navarin Farm. The Americans were within range of the Kriemhilde line which extended from Grand Pré to Damvillers across the Meuse. East of the Meuse the Americans captured Marcheville and Rieville, which strengthened the flank of the army west of the Meuse. On the 29th and 30th, Gouraud advanced to within 5 miles of Vouziers.

Second Phase. The second phase of the Argonne-Meuse offensive was carried out by the 1st, 5th, and 3d Corps and lasted from October 4 to 31. In the first part of this phase the American army encountered its hardest fighting of the War. About the middle of this period, General Pershing divided the American forces into the I and II armies. The I army, which was assigned to General Liggett, extended from the Argonne to Fresnes-en-Woevre. The II army, extending from Fresnes to the Moselle, was commanded by General Bullard. Beginning on the 4th, the I American army captured Cesnes, and advanced 2 miles up the Aire River valley. On October 5, the Germans before Gouraud retired along a 12-mile front closely pursued by the French army. By the 11th, the French held the whole line of the Sappe River and the Americans had seized the heights dominating the Aire valley. So far the French had taken 21,000 prisoners and 600 guns. On the 14th, the Americans took St. Juvin, and two days later took the important town of Grand Pré and Champigneulle. On the 17th Romagne fell and the Americans were everywhere beyond the Kriemhilde positions. During the next day Bantchéville and Talna Farm were seized in surprise attacks. They changed hands several times before remaining in the possession of the Americans. On the same day the French crossed the Aisne near Vouziers, and made important gains toward Reims.

The only German defense between the Americans and the Belgian border was the Freya-Stellung which ran from near Dun-sur-Meuse to the Bourgogne wood. About 10 miles north of this line was the great trunk railway line running from Metz to Mézières, through Sedan and Montmédy. Part of the Freya line was seized on October 26 and the railway line was bombarded.

Last Phase and Pursuit. In connection with this phase of the Argonne-Meuse offensive, General Pershing states, "On the 21st my instructions were issued to the I army to prepare thoroughly for a general attack October 28 that would be decisive if possible. In order that the

attack of the I army and that of the IV French army on its left should be simultaneous our attack was delayed until November 1.

"On this occasion and for this first time the army prepared for its attack under normal conditions. We held the front of attack and were not under the necessity of taking over a new front with its manifold installations and services. Our own personnel handled the communications, dumps, telegraph lines and water service, our divisions were either on the lines or close in rear, the French artillery, aviation and technical troops which had previously made up our deficiencies had been largely replaced by our own organizations, and our army, corps and divisional staffs were by actual experience second to none."

On November 1, both General Pershing and General Gouraud began their final advance. The latter crossed the Aisne between Rethel and Vouziers, and advancing with Berthelot's army on the left, reached the outskirts of Mézières, when the Armistice went into effect (November 11). General Pershing's forces reached Sedan on the 6th. Between that date and the 11th, east of the Meuse, he seized the heights of the Woëvre, and had brought Metz into offensive gun-fire range.

The Franco-American advance in the Champagne-Argonne-Meuse region cut the German main line of communication (mentioned above) and foreordained a complete defeat within a very short time for Germany, had the Armistice not intervened. Some of the bitterest fighting of the War occurred in this section. Most of it was hand to hand and the nature of the ground, with its ravines, gullies, forests, etc., made it necessary to wipe out machine-gun nests with infantry rather than with artillery. The Americans captured 26,000 prisoners and 468 guns. The French took about 30,000 prisoners and 700 guns. It is estimated that the Germans lost 150,000 men trying to defend their main line of communication.

American Troops in France. On Armistice Day, 42 American divisions had either reached France or were en route; of these, 29, including replacements from the other divisions, were actually engaged in combat. Of the latter, 7 were Regular divisions, 11 National Guard divisions, and 11 National Army divisions. The total American forces sent to France is given as 2,084,000 of whom it is estimated that 1,390,000 took part in campaign; of the latter 1,100,000 as divisional troops, 240,000 as corps and army troops, and 50,000 in the service of supply.

The casualties in the American army were about 260,000, of whom about 50,000 were battle deaths. As the army met with no serious reverses, the number of prisoners taken by the enemy was small, only 4500. The casualties occurred mainly between May 28, 1918, when the 1st division attacked Cantigny, and November 11. In its operations it captured 63,000 prisoners and about 1400 pieces of artillery in addition to other arms and stores.

Breaking the Hindenburg Line. In the section treating the German retreat to the Hindenburg line it was narrated how certain sectors of this line were penetrated and how the Quéant-Drocourt line was smashed. This section will deal with the breaking of the line itself, the capture of Cambrai, St. Quentin, and Laon and the advance across France and

Belgium until the Armistice put an end to the fighting. The reader must bear in mind that while this tremendous drive was pushing the centre back the Allies were crushing one flank in Flanders and the other in the Argonne-Meuse region. In the bitter fighting that resulted in the breaking of the famous defense system, the 27th—O'Ryan—and the 30th—Lewis—American divisions played important parts.

Although the main attack was made on September 26, important advances in the direction of Cambrai were made on the 27th, when Byng and Horne with the American 2d Corps—Graves—(27th and 30th divisions) struck on a 14-mile front before Cambrai, crossed the Canal du Nord, and pierced the outposts of the Hindenburg line. On the 28th, Marcoing, Fontaine-Notre-Dame, Cantaing, and Novelles were taken. On the 29th, Rawlinson, with the aid of the Americans, struck on a 30-mile front from St. Quentin to the Sensée Canal. The former crossed the Scheldt Canal and the latter, after seizing Ballicourt and Nauroy, entered the suburbs of Cambrai itself. Horne now attacked in the Arras sector and advanced toward Douai by capturing Oppy and Blache-St. Vaast. This compelled the Germans to retire from the Lens coal-field region. Byng, by crossing the Scheldt Canal northwest of Cambrai, threatened the city from that direction.

While these operations were going on around Cambrai, the fate of St. Quentin was being sealed. After nibbling operations, the French and British captured Thorigny and Le Tronquoy, about 3 miles from the city (September 30). On the first of October, Debeney's army occupied part of the city, and the next day seized all of it. In the meantime Rawlinson's army forced the Scheldt Canal and occupied Le Catelet and Beauvoir.

On October 9 a great drive covering the whole line from Cambrai to the neighborhood of St. Quentin was begun without artillery preparation. It was a tremendous success, penetrating 9 miles on a 20-mile front. Cambrai was occupied on the very first day, which necessitated a further retreat on the Arras-Lens front, toward Douai. By the 10th the British had advanced their lines to the Selle River between Solesmes and St. Souplet, and captured the important German base of Le Cateau. On the next day the Germans abandoned the line along the Sensée River and the Allies were closing in on Douai. This city fell on the 17th.

On the 20th, the British forced a crossing of the Selle north of Le Cateau and on the 22d advanced from northwest of Tournai to southwest of Valenciennes, patrols actually reaching the suburbs of the latter city. On the 25th the Valenciennes-Le Quesnoy railway was reached on a 7-mile front. On November 2, Valenciennes fell after a pinching operation, and they advanced along the road to Mons. On November 4, the British and Americans struck on a 20-mile front between the Scheldt and the Oise-Sambre Canal and forced the Germans to make a retreat on a 75-mile front from the Scheldt to the Aisne. As a result of this the French took the fortified city and railroad centre of Hirson, and the British captured the fortress of Maubeuge on the 9th of November. On the 11th, the last day of fighting, the British captured Mons, the scene of their defeat and retreat in August, 1914.

In considering the breaking of the Hindenburg line, the events that occurred between the Oise and the Aisne and which resulted in the capture of Laon and the Chemin des Dames, must be included. Foch determined to use his "pinchers" method on a large scale in order to capture Laon. To accomplish this he had to advance through the formidable forest of St. Gobain and recapture the Chemin des Dames positions. After the "pinching" of the Marne salient (July, 1918) the Franco-Americans had nibbled away at the German positions to get a good place to start their offensive. The Americans had taken the Juvigny plateau and later the French seized the Vauxaillon plateau just south of the Aisne. The German Crown Prince made repeated and bitter attacks to retake these strategic positions, but they were futile as well as costly. On September 28, General Mangin's Franco-American army captured Fort de Malmaison, the old limestone position which is in the rear of the Chemin des Dames. Then began a slow advance between these positions and the Ailette River as well as between the Aisne and the Vesle. Berthelot's V army in conjunction with Mangin's X army and with the aid of Italian troops, began an advance northwest of Reims, which resulted in the capture of Berry-au-Bac on October 7. On the 9th, Bazancourt and Vaux-les-Maures fell. By the 12th, Mangin had succeeded in occupying practically the entire Chemin-des-Dames positions. The next day saw the success of Foch's strategy because the St. Gobain Forest, La Fère, and Laon were evacuated by the Germans with scarcely any fighting.

The French armies of the left now advanced rapidly between the Aisne and the Oise Rivers with the idea of reaching the Franco-Belgian frontier between Hirson and Mézières. When the Germans began their retreat between the Scheldt and the Aisne, the French armies of the left exerted strong pressure on the German flank. By the 8th of November they were at the outskirts of Mézières, but were unable to capture it before the Armistice was signed on the 11th.

This ended the battle or series of battles which resulted in the breaking of the Hindenburg line and which were also largely responsible for the Germans suing for an armistice. The occupation of the east bank of the Meuse north of Verdun by the Americans left the Germans with no easily defended line west of the Rhine. It is extremely doubtful whether the Germans could have reached the Rhine with sufficient men, material and organization, to prevent an invasion of Germany by the Allies on a grand scale.

Operations in Belgium. The opening attack on September 28 was made by the reorganized Belgian army, under the personal direction of King Albert, and the British II army, under Plumer, on a 10-mile front from Dixmude to Passchendaele Ridge, north of Ypres. This initial attack penetrated 4 miles. On the next day the Belgians captured Dixmude, Passchendaele, Stadenberg, Moorslede, and Zarren and were only 2 miles from Roulers. On this same day the British took the formidable Messines and Passchendaele Ridges and Gheluvelt. On the 1st of October, the Allies crossed the Menin-Roulers road and struck in a southerly direction, reaching the Lys River between Warvick and Warneton.

The threat to envelop the industrial centre of Lille had now become so pronounced and had created such a serious position for the German forces that the German command determined to evacuate it, which necessitated retirement from the Belgian coast. Consequently, on the 2d the Germans began the evacuation of the city and a retreat on both sides of La Bassée Canal. This retreat was accelerated by the joining of Degoutte's VI French army to the Belgian and British armies. The Belgians captured Hoogledede and Handzeeme northeast of Roulers, and the British seized Rollegheencapelle, between Courtrai and Roulers. Armentières was entered on the same day.

After a week and a half of further preparation, the Allies struck an extremely heavy blow aimed at clearing the west bank of the Scheldt as far as Ghent. The attack extended from the Lys, near Comines, to the sea. The Belgians drove forward 7 miles north of a line running from Handzeeme to Courtermarck, and the French and British to the Hoogledede plateau, Winckelhoek and Lendeledede. The German forced retreat from Belgium now began in earnest. The Belgians advanced steadily along the roads to Bruges and Ostend from Thourout, and the French advanced toward Thielt, while the British advanced along the Lys from Comines. On the 17th the British entered Lille and naval forces entered Ostend, which had been evacuated. On the next day Zeebrugge was entered, as well as Bruges, Thielt, Courtrai, Tourcoing, and Roubaix.

Between the 20th and 25th of October, the French and British forced the Lys Canal in the direction of Ghent. The British in the south took Bruay and Estain. On the last day of the month Byng's army, with the aid of the 30th American division, struck between the Lys and the Scheldt from Deynze to Avelghem and captured several villages, and towns. While this operation was going on the British and French were driving the Germans back on Ghent and the lines of the Scheldt. The retreat was precipitous. On November 3, the Belgians advanced 10 miles along the Dutch frontier and reached the Terneuzen (Dutch) Ghent Canal. This advance coupled with that of the French and the British in the south brought the Allies to within 5 miles of Ghent. The British forced the Scheldt near Pofter and began an advance on Brussels. Tournai fell to the British on November 9, and when fighting ceased two days later, the line in Belgium ran almost north and south from Terneuzen to north of Audenarde and then southeast to Mons. Marshal Foch is credited with the statement that the German army would have been captured or destroyed within six weeks (after November 11) but he had agreed to an armistice to save lives. More than 60,000 prisoners and 500 guns of all calibres had been captured in this flank movement.

The Armistice. Negotiations between the United States and Germany, which began on October 5, ended on November 5, when President Wilson informed the Germans that Foch had been authorized by the United States and the Allies to open negotiations with accredited German agents. This was followed two days later by announcement that German agents had been appointed and were about to leave the German Headquarters at Spa, Belgium. They were received at Foch's quarters the next day and received the terms of the armistice from

him. A request to stop hostilities until the terms had been sent to the German Headquarters was refused. After several delays the terms were accepted by Germany on November 11 at 5 A.M., Paris time, and the War ended at 11 A.M. that day. A brief summary of the terms follows.

Germany surrendered all her submarines and agreed to disarm her surface men-of-war which were to be interned in neutral ports, or taken over by the Allies. The treaties of Bucharest and Brest-Litovsk were renounced, all damage done was to be repaired and all foreign occupied territory was to be evacuated. An indemnity was to be agreed upon later. The Allies were to occupy the valley of the Rhine. There was to be a neutral zone on the east bank of the Rhine and Allied and American bridgeheads at Mayence, Coblenz, and Cologne, each with a radius of 30 kilometers.

The evacuation of the territory west of the Rhine went along very smoothly. The Allies were hailed as deliverers in Belgium, Luxembourg and especially in Alsace-Lorraine, which was triumphantly entered by French forces. A similar entry was made into Brussels by King Albert and his Queen riding at the head of the Belgian troops. The British took over the administration of the zone around Cologne, the Americans that around Coblenz, and the French that around Mayence.

On Dec. 14, 1918, the terms of the Armistice were renewed until Jan. 17, 1919. During this period the conditions that were unfulfilled were to be completed. The following provision was also added to the general terms: "The Allied High Command reserves the right to begin, meanwhile, if it thinks it wise in order to ensure new guarantees, to occupy the neutral zone on the right bank of the Rhine to the north of the bridgehead of Cologne, up to the Dutch frontier. This occupation will be announced by the Allied High Command by giving six days' notice." Subsequent renewals of the Armistice terms occurred during the time that the Peace Conference was holding its meetings at Paris.

THE EASTERN FRONT

The early advance of the Russian armies into East Prussia in August, 1914, seriously affected the German invasion of France and almost upset the entire German plan. Von Hindenburg, however, frustrated the attempt of the Russians to overrun East Prussia by his victory at Tannenberg. Meanwhile the Russian armies advanced victoriously into Galicia and soon were well on their way to Cracow and into the passes of the Carpathians. To relieve the pressure on the Austrians, German Headquarters organized a counteroffensive through West Poland, which ended in a deadlock in the winter of 1914-15 with the opposing armies intrenched. In the spring of 1915, the Central Powers began a great offensive and by September of that year the Russians were driven out of Poland and Courland. This front then remained stabilized until May, 1916, when the Russians opened a successful campaign against the Austrian front to relieve the pressure of the Austrians in Italy. This success was followed by the Russian Revolution which ultimately prevented that country from being a further factor in the War.

The detailed account of the military operations falls under the following head. (1) Russian invasion of East Prussia terminating in the

battle of Tannenberg and the first battle of the Masurian lakes; (2) Russian invasion of Galicia; (3) German operations in West Poland; (4) second battle of the Masurian lakes; (5) Austro-German drive in Galicia; (6) great Austro-German drive in the east; (7) Russian offensive in 1916; (8) military operations during the Kerensky government; (9) military operations during the Bolshevik government to the end of the War.

The struggle on the Eastern front was conditioned by a number of circumstances. First the German plan, which was based on a decisive victory in France before the Russians could get ready, few troops were therefore to be left to guard the east front. Next was the unexpected promptness of the Russian mobilization and concentration. Lastly and of paramount importance was the configuration of the frontier itself and its organization in view of war. The striking feature of the configuration was that Russian Poland projected like a huge bastion 200 miles deep between East Prussia on the north and Galicia on the south and that the political frontier separating the belligerent states was in no sense a military frontier. The Russian base of operations against East Prussia and the line of defense to which the armies could retire in case of defeat was that formed by the Niemen River between Kovno and Grodno and the Narew River with its principal tributary, the Bohr, from Grodno to the mouth of the Narew. On the Niemen were the fortified bridgeheads of Kovno, Olita and Grodno where railways crossed the river. On the Narew and Bohr were the fortified bridgeheads of Osowiec, Lomza, Ostrolenka, Rozan, Pultusk, Sierok, and at the junction of the Narew and Vistula the great fortress bridgehead of Novogeorgievsk. The German base of operations in the north was the Vistula River between the fortresses of Danzig and Thorn. Along this stretch of river there were a number of fortified bridgeheads. The province of East Prussia lay in advance of this line and for its defense the Germans had to rely on active defense by troops based on their complete network of railways and roads. The Masurian lakes near the frontier formed a north and south natural barrier about 40 miles long and the fortress of Königsberg was a strong point of support for military operations.

The Russian base of operations in Central Poland was the Vistula River from Novogeorgievsk to the Austrian frontier; along this stretch of river were the great fortified bridgeheads of Warsaw and Ivangorod. The German frontier from the Vistula to the Austrian frontier was an open one but parallel to it were a number of excellent railways for active defense.

From the Vistula to the frontier of Rumania the Austro-Russian frontier was an open one and for its defense both countries had to rely on active operations of their armies. The military frontier of Austria was the Carpathian range of mountains in rear of its border provinces of Galicia and Bukovina. Against invasion from the east, Austria could hardly hope to hold the entire province of Galicia, so her military authorities had constructed a barrier line from the Vistula to the Carpathians along the San River. On this river there were the fortified bridgeheads of Jarislau, Radyma and the great fortress of Przemyśl.

In accordance with the Allied plan, the Russian armies were to assume the offensive as soon

as possible. The aim of their first campaigns was to drive the Germans out of East Prussia and the Austrians out of Galicia and Bukovina in preparation for an advance from West Poland. For these campaigns they immediately organized six great armies, two for the invasion of East Prussia and four for the invasion of Galicia. The Russian commander-in-chief was the Grand Duke Nicholas.

Russian Invasion of East Prussia. For the defense of East Prussia, German Headquarters left in the east of the active army only three army corps and a cavalry division. There were mobilized in addition two reserve corps and the local Landwehr and Landstrum troops. These troops formed the VIII army—von Brittwitz—and also furnished the garrisons for the fortified bridgeheads on the Vistula and the garrison of the fortress of Königsberg. As the Russians would probably invade East Prussia both north of the Masurian lakes from the direction of Kovno and south of the lakes from the Narew River, the VIII army was divided into two separate wings, the left wing, consisting of two active corps and three reserve divisions with the cavalry division, was to guard the frontier north of the lakes, while a single active corps with Landwehr troops was to guard the frontier south and west of the lakes.

In August, 1914, Russian Headquarters organized two armies for the invasion of East Prussia. The I army—Rennencamp—was to advance from the Niemen River between Kovno and Grodno and advance along the Kovno-Königsberg railway north of the Masurian lakes. The II army—Samsanoff—was to advance from the Narew River with its left resting on the Warsaw-Danzig railway and its right passing the south end of the Masurian lakes. Contact between the two armies was to be secured after passing the lakes. Rennencamp was the first to reach the frontier, August 17, just as the German armies in the west began their advance; here he encountered the advance posts of the left wing of the VIII army. For a week there was constant fighting in which the weaker German force was steadily pushed back and on August 24 Rennencamp reached the line of the lakes and Insterburg. Instead of pushing on westward he apparently halted here to await the arrival of Samsanoff to protect his left and in the meantime his cavalry sought the right flank of the II army and reconnected along his front. Samsanoff reached the frontier several days later, August 22, and easily dispersed the weak detachments in his front. His centre now moved on Allenstein while his right moved northward to seek contact with Rennencamp.

On August 22 the situation seemed very serious to the commander of the VIII German army, who found both wings in retreat, and although he made preparations to concentrate on Samsanoff, he informed German Headquarters at Coblenz that he might be compelled to retire behind the Vistula. At this stage Headquarters decided to intrust the command of the VIII army to von Hindenburg, a retired general who was thoroughly conversant with the topography of East Prussia, and sent to him as his chief of staff von Ludendorff, a staff officer of the II army who had shown great initiative in the capture of the town and bridges of Liège. Von Hindenburg took command on August 23 and found the situation as above stated. The two Russian armies were still separated and his only chance for

success was to decisively defeat one of them before they could unite. Calling from the nearby fortresses all their available troops, he succeeded in raising his army to five and one-half corps, which was nearly that of the II Russian army. His plan was a bold one for he proposed to leave but a mere screen in front of Rennencamp and employ his entire force against Samsanoff. In order to make his victory decisive, if possible, he proposed to envelop both wings of the II Russian army. His predecessor had already made this possible by moving a corps from the extreme left of his army to the extreme right by rail. It took several days to get the troops in position but by the 27th all was ready for the attack. Two and one-half corps were in front of Allenstein to check the advance of Samsanoff's centre, consisting of three corps; two corps had withdrawn from Rennencamp's front and were ready to move southward in rear of the lakes on Samsanoff's rear protected by a single corps, and one corps was ready to turn Samsanoff's left protected by a single corps. Fortunately for Hindenburg, Rennencamp made no attempt to advance and his cavalry failed to penetrate the German screen to discover what was going on in its rear.

The battle of Tannenberg, as it was called, began on the morning of August 27 and lasted three days. Samsanoff was found dead on the field and two of his corps commanders with 90,000 men were captured. Three of his corps were practically annihilated and the others escaped only with severe losses. The battle was named in honor of one of the same name fought there in 1409 between the German Knights and the allied Poles and Lithuanians. As the I and II Russian armies were advancing into East Prussia, Russian Headquarters began the organization of the X Army at Grodno to serve as a general reserve. Two corps of this army advanced across the frontier east of the Masurian lakes just in time to cover the retreat of the remnants of the II army.

After the battle of Tannenberg, von Hindenburg was reinforced by two army corps and a cavalry division from the Western front and made preparations to attack Rennencamp's army. His plan was to engage Rennencamp's front with his main force while his right wing moved south around the Masurian lakes to cut off the retreat of the Russian army. His right wing, however, unexpectedly encountered the X Russian army, which defeated his plan, and all he was able to accomplish was the retreat of the Russians across the frontier to the Niemen River. In these operations, which began September 7 and lasted about a week, the Germans claim to have taken 45,000 additional prisoners; they call the operations the first battle of the Masurian Lakes. While the situation on this front was still unstabilized, von Hindenburg was compelled to go to the assistance of the Austrians.

Russian Invasion of Galicia. The German plan, as we have seen, contemplated the crushing of France, while Russia should be held by the Central Powers. In form, so far as Austria was concerned, the holding was to begin by an invasion of Russian Poland. South of the frontier two railways run roughly parallel to the boundary, and from these two run branch lines and feeders. The Russians were not nearly so well off in the matter of transportation. Given, therefore, the supposed slowness of Russia's mobilization and the poverty of her rail system,

an invasion of Russian Poland seemed to be a promising undertaking.

According to the plan of attack drawn up by the chief of staff, Gen. Conrad von Hotzendorff, the invasion was to be made by two armies. The I army under General Dankl concentrated on the lower San River was to advance northward east of the Vistula to seize the railway junction of Lublin; its left was protected by a detachment, largely cavalry, which was to operate west of the Vistula and then cross that river. Its right was protected by the IV army—Auffenberg—which was concentrated at Jaroslav and was to advance northward to the railway junction of Cholm. The III army—Brudeimann—was concentrated east of Lemberg and was to defend the frontier between the Bug and Dniester Rivers. The II army was on the Serbian frontier but had one corps in Galicia which was to guard the frontier south of the Dniester River and cooperate with the III army.

The Russian mobilization against Austria was begun a week before that against Germany and in the month that elapsed before actual hostilities the armies were concentrated for active operations. In southern Poland between the Vistula and Bug Rivers was an army group consisting of the IV and V Russian armies under General Ewart. On the eastern frontier of Galicia between the Bug and Dniester Rivers were the III Russian army—Rusky—and the VIII Russian army—Brusiloff—forming a group under Ivanoff. South of the Dniester River were detachments of the VII Russian army on the frontier of Bukovina. Each of the four principal armies was stronger than any of the three Austrian armies.

On August 25, well south of Lublin and Cholm, the two Austrian armies encountered such strong resistance that they were unable to advance as the IV and V Russian armies were in their front. On August 22 the great Russian advance of the III and VIII armies began and the VII invaded Bukovina. The Austrians were unable to offer any adequate resistance and the Russians advanced triumphantly and occupied Lemberg on September 3. To stem the Russian tide, Austrian Headquarters recalled the remaining corps of the II army from Serbia and with the II, III and IV armies took up the position of Rawaraska-Grodek west of Lemberg facing east. Here was fought a battle, September 7-11, on the same days that Hindenburg was attacking Rennencamp in the north and the battle of the Marne was in progress in the west. The Austrians were defeated and retired to the San River where the I Austrian army was compelled to join them. The Russians now pushed on, crossed the San River and invested the fortress of Przemyśl. South of the Dniester they occupied Bukovina, took possession of the passes in the Carpathians and their cavalry was advancing into Hungary. Such was the situation when Austrian Headquarters called on the Germans for help and von Hindenburg was sent from East Prussia to Silesia to take command there and organize a new army.

German Operations in West Poland. In order to create the IX German army in Silesia, von Hindenburg was compelled to withdraw four of his corps from East Prussia and replace them as far as possible with Landwehr and newly organized units. When he reached Silesia, von Hindenburg learned that there were few Russian

troops in Poland west of the Vistula River; with the Austrian chief of staff he decided on the plan of operations. The IX German army with the I Austrian army on its right was to advance eastward to the north of the Vistula thus turning the flank of the Russians in Galicia, so that they would be obliged to cease their pressure on the Austrians south of the Vistula to meet this threat. The IV, III and II Austrian armies were then to advance as soon as possible and relieve the fortress of Przemyśl; the IV army from the west and the III and II over the Carpathian mountains.

The IX German army began its advance in the latter part of September and soon the effects of the movement were seen in the shifting of the Russian troops. These fell back across the San River and the IV and V armies began a movement up the east side of the Vistula River. The IX German and the I Austrian armies reached the Vistula without much opposition and eventually the I Austrian army took up the front from Ivanogrod to the San while the IX German army extended its flank northward to Warsaw. They were, however, unable to capture the bridgehead of Ivanogrod or that of Warsaw, so the Russians still had access to the west bank. In Warsaw the Russians had begun the formation of their IX army. Due to the shifting of the Russian troops, the Austrians were able to get supplies into Przemyśl but that was all, their armies were unable to cross the San River.

When the Russians began to shift their troops, the command of those left in Galicia was given to Ivanoff and those assigned to operate in West Poland to Rusky. By the 20th of October, Rusky felt strong enough to engage his adversaries west of the Vistula and the Russians advanced once more, this time on the whole front from Kovno to the Carpathians. In East Prussia, the German VIII army was compelled to retire across the frontier to an intrenched line which ran from the Masurian Lakes to the Niemen River. Von Hindenburg was unable to offer adequate resistance in West Poland and with the I Austrian army retired about 200 miles back across the frontier into Posen and Silesia. To delay the Russian advance he destroyed the railways that his troops had just repaired. In Galicia the Austrians retired to the vicinity of Tarnow and over the Carpathians leaving the garrison of Przemyśl to its fate.

On November 1 the situation of the Central Powers on the Eastern front was apparently desperate, as the German armies in the west were engaged in the desperate battle of Flanders and could not afford to send infantry to the east; most of the cavalry had already been sent to the VIII and IX armies. Von Hindenburg was now placed in command of both the VII and IX armies and von Mackensen was placed in command of the IX army.

Realizing that he was not strong enough to meet the Russians at all points of their front, von Hindenburg decided to concentrate the IX army for a flank attack. He therefore had it railed to the frontier between the Vistula and Warta Rivers where it could advance with one flank protected by the Vistula. The defense of the frontier from the Warta southward was left to Landwehr and local troops assisted by the I Austrian army. They were to advance if his attack was successful.

On November 11 he was ready to strike; at this time the Russians were already near the

frontier all the way from the Vistula to Cracow and some of their cavalry had actually crossed it. The IX German army drove back the right wing of Russky's armies between the Niemen and the Warta and the endeavor of the Russians to check the advance resulted in more or less confusion along their entire front. Ewart now took command of the left wing of these armies while Russky remained in command on the right. The operations in West Poland continued from week to week and ended only about the close of the year. They ended with the opposing armies intrenched along the Bzura, Rawa and Nida Rivers. The most important engagement was the battle of Lodz, in which, in attempting to envelop the flank of the Russian armies, three German divisions and two cavalry divisions were suddenly cut off from the remainder of the IX army and for two days were surrounded by Russians. According to German reports they finally emerged with 10,000 prisoners. In Galicia the Austrians were driven behind the Dunajec River and lost nearly all the important passes in the Carpathians. After operations closed in November on the Western front, a number of corps were sent from there to West Poland in the hope that the Russians might be forced behind the Vistula River. By the time of their arrival the Russians were already intrenched and the desperate attempts made to dislodge them resulted only in tremendous losses in the attacking German troops.

At the close of the year the combatant troops on the Eastern front, as given by the German chief of staff, were as follows:

	Germans	Austrians	Total	Russians
On the East Prussian frontier	105,000		105,000	320,000
West Poland	385,000	140,000	525,000	847,000
Galicia and Bukovina	12,000	513,000	525,000	521,000

A German division was assisting the Austrians in the Carpathian passes.

1915. Second Battle of the Masurian Lakes. At the close of 1914, as previously stated, the Russians again occupied East Prussia as far west as a north and south line through the Masurian Lakes. This force was the X Russian army—Sievers—as the I Russian army was now along the frontier between the lakes and the Vistula. German Headquarters decided to take advantage of the cessation of hostilities on other fronts and by a winter campaign drive the Russians across the frontier and if possible across the Niemen and Narew Rivers. For this purpose several new divisions were sent to von Hindenburg and he formed the X German army—von Eichorn—to operate to the left of the VIII army. As at Tannenberg, von Hindenburg planned to envelop both flanks of the X Russian army by attacking close to the Niemen in the north and south of the lakes. The Russians were in winter quarters and not expecting attack when it suddenly developed February 7 and was executed under severe weather conditions with frequent snow storms. The campaign lasted two weeks and ended with the capture of 100,000 Russians, including a corps and three division commanders and some 300 guns. The Germans attempted to capture the fortress of Osowiec but were repulsed. The operations were extended to cover the front of the I Russian army but met with little success. Russky, who had been in command of the Russian right which included the X army, was now relieved by Alexieff.

In Galicia, during the winter, the IV Austrian and the III Russian armies faced each other

between the Vistula and Carpathians while the II and III Austrian and VIII Russian armies faced each other on the crest of the Carpathians. The XI Russian army was besieging Przemyśl. German divisions had been sent to reinforce the Austrians in the mountains to recapture the passes but the winter operations there were of no avail. In March, Przemyśl surrendered and its besieging army reinforced the VIII Russian army. In Bukovina the VII Austrian army was engaged with the VII Russian army.

In the spring of 1915 the situation on the Eastern front was very unsatisfactory to German Headquarters. The Austrian armies were discouraged and from the crests of the Carpathians the Russians threatened an invasion of Hungary. The government of Italy was wavering and at any moment Austria might be called upon to meet a new enemy. It was therefore decided to attempt a blow that would compel the Russians to retreat from the mountains. For this purpose a new army, the German XI army, was organized behind the IV Austrian army; this was made up of picked corps from the Western front and was well supplied with heavy artillery. Von Mackensen, who had successfully commanded the IX army, was assigned to its command and the IV Austrian army as well as the Austrian and German troops in the Carpathians were directed to cooperate with him. This new army quietly replaced the troops of the IV Austrian army in the southern sector between the Vistula and the Carpathians. If the XI German army could break through the left wing of the III Russian army and advance at the foot of the

mountains, the Russians in the passes would have to retreat or risk the danger of capture. Once the passes were freed, the Austrian and German troops in their rear could advance to the plain and take part in the general drive. It should be stated that the Russian intrenched lines were by no means so strong as the intrenched lines on the Western front.

Austro-German Drive in Galicia. A terrific cannonade began along Mackensen's front on the afternoon of May 1 and continued through the night to prevent the Russians from repairing damages. On the 2d it began at daylight and lasted four hours, when the infantry attack was launched. The Russian front was shattered and although here and there the Russians offered stubborn resistance the tide swept on and one by one the Carpathian passes were evacuated and the Austro-German forces in their rear moved down to swell the forces in the plain. By May 15 the San was reached, where the advance was temporarily halted to repair the railways, bring up supplies and heavy artillery, relieve some of the corps engaged in the first movement, and secure both banks of the river for a further advance. It was at this time that Italy declared war and a part of the I Austrian army was sent there to reinforce the V and VI armies from the Serbian front. On June 2, Przemyśl was evacuated by the Russians and by the middle of June the Austro-German armies were ready for another advance. In the meantime the Russians had taken up a defensive position on the Rawaruska line, where they had defeated the

Austrians in 1914. This line was forced on June 18 and on June 22 one of the Austrian armies occupied Lemberg.

From the San River the IV Austrian and XI German armies had turned northward and advanced with the left flank resting on the Vistula but at the frontier they were stopped. The Russian armies in West Poland had retired to the vicinity of the Vistula and had concentrated a strong force in their front. To reduce this resistance it became necessary to strike another blow at some other point of the Russian front. Operations had already been begun in the extreme north where the German Baltic army, largely cavalry, had crossed the Niemen River in April and now occupied the line of the Libau-Kovno railway. On July 2 there was a conference between von Falkenhayn, chief of staff of the German armies, and von Hindenburg to determine the new point of attack. Von Hindenburg recommended that this attack be made in the direction of Kovno and thus threaten the main lines of communication of the Russians which ran through Vilna and its vicinity. A successful drive here would compel the Russians to retreat toward the Pripiet marshes. Falkenhayn, however, considered this plan too ambitious and was content with forcing the Russians to evacuate the line of the Vistula. Upon his recommendation, therefore, the attack was to be delivered along the Narew River, here a successful drive would compel the Russians to evacuate Warsaw but would leave their lines of retreat open.

The Great Austro-German Drive in the East. For the opening attack of the great drive which was to extend from the Baltic on the north to Rumania on the south a new XII army—von Gallwitz—was formed on the left of the VIII army, whose mission was to force the crossing of the Narew River. The attack opened on July 13 but it was only 10 days later that the Germans by the capture of the bridgeheads Ostralenka, Rozan, and Pultusk were able to cross the Narew in force. It was immediately followed by the complete withdrawal of the Russian forces from West Poland across the Vistula River and the beginning of the general retreat. Ivangorod was evacuated on August 4 and Warsaw on the following day. In Novogeorgievsk the Russians left a garrison of 80,000 men but under the fire of heavy artillery it fell in a few days and its garrison surrendered. The retreat of the Russians was followed by an advance of the Austro-German forces along the entire front. In the south the Austro-German Carpathian armies moved eastward from Lemberg and into Bukovina, farther north von Mackensen with his two armies advanced to the Bug River, where the Russians evacuated the fortress of Brest-Litovsk, August 25, and fell back to the Pinsk marshes, the Austro-German forces in West Poland crossed the Vistula and reinforced the XII army; the VIII army forced the crossing of the Narew and Bohr rivers and captured the bridgehead of Lomza, August 10, and that of Osowiec, August 22; the X army advanced against the fortress of Kovno on the Niemen, captured it on August 17, and the great railway junction at Vilna a month later, in the extreme north the German Baltic army captured Mitau and reached the Dwina River between Riga and Dwinsk or Dunaburg.

About the middle of September active operations ceased and the Eastern front became stabilized. The new front followed the Dwina

River from Riga to Dwinsk then ran almost due south to the Dniester River; the Russians still occupied a small section of eastern Galicia. While the Germans had possession of all the frontier fortresses of Russia and had seriously injured the morale and the fighting ability of the Russian armies, they had not been able to force a decision on the Eastern front because of their failure to prevent the retreat of the Russian armies. It was during the Russian retreat on September 5 that the Grand Duke Nicholas was relieved from the command of the Russian armies and sent to command the Russian forces on the Turkish front, the Czar took command of the armies with Alexieff as chief-of-staff and Brusiloff again commanded the northern group.

Year of 1916. After the cessation of operations in the autumn of 1915 and during the following winter the Russians made strenuous efforts to reorganize and equip their armies. In this they were considerably handicapped by a corrupt and inefficient war department and by their inability to receive munitions from their allies and neutrals. During the winter supplies from the outside could only be received through ports on the Pacific where terminal facilities were inadequate and over a long line of railway with limited rolling stock in poor condition as a result of the war. In the spring, Kuropatkin, who had been in command of the Russian armies in the Russo-Japanese War, was assigned to the command of the northern group, and Brusiloff to the southern group. Ewart remained in command of the central group.

The military situation on the Russian front was improved during the autumn, winter, and spring by the withdrawal of German and Austrian troops, first for the drive in Serbia, then the attack on Verdun and lastly by the Austrian drive in Italy. At this time the northern and central groups of Russian armies, which extended from Riga to the Pripiet marshes, were facing the Baltic, X, VII, and XII German armies under von Hindenburg and the central group under Prince Leopold of Bavaria, consisting of the IX German army with some Austrian troops which prolonged the line to the marshes. The southern Russian group was opposed mainly by Austrian troops, in the centre was an Austro-German army under German command.

When the German Crown Prince opened his tremendous assault on Verdun in February the Russians were requested to attack the Germans to relieve the pressure on the Western front and to prevent the sending of German troops to the Western theatre. Attacks were consequently made at various points. The main attack was made by two armies of the central group east of Vilna in March. Severe fighting followed, but did not change the position of the lines, although the object was probably accomplished. While they were unable to assume the offensive, the Germans had strongly organized their lines, as they desired to hold all the territory gained in order to draw from it supplies; the Allied blockade had cut them off from supplies through neutral states. Minor attacks were made on this front during the year but without material results.

Brusiloff's Offensive. Brusiloff whose front extended from the Pripiet Marshes to Rumania had under his command four armies and was later reinforced by a fifth from the central

group. When called on in May to assist the Italians by a counterattack in the east he was ready to act. At this time, the Russians had on the east front about 140 divisions of infantry and 33 divisions of cavalry, probably depleted in strength. From the railway junction of Rovno, then held by the Russians, two railways run westward, one to the northwest to the railway junction of Kovel where the line forks toward Warsaw and Brest-Litovsk and the other to the southeast toward Lemberg crossing the Galician frontier at Brody. It was along these two railways that Brusiloff planned attacks by his right wing, consisting of two armies with Kovel and Brody as objectives. Farther south one army was to attack on each side of the Dniester River.

The attack began on May 4; that same day the Austrian line in front of his right wing was broken and two days later the Russians had captured Lusk, several miles in rear of the Austrian front. The two Russian armies now advanced and at the end of two weeks had advanced about 40 miles on a front of 80. In the meantime, German troops were sent from the north, and succeeded in checking the advance. A fifth Russian army was now deployed on the right of the others but was unable to make any headway; the objective, Kovel, could not be reached. The attack north of the Dniester was repulsed and it was only in the latter part of July, when Brusiloff captured Brody and threatened the flank of the Austro-German army on this front, that it fell back to a new position 15 miles in the rear, from which it could not be dislodged. South of Dniester, the Russians recaptured Bukovina and advanced as far as they could safely go while the Austro-Germans still held the north bank. About the middle of August the Russian operations ceased on this front, as Rumania was about to declare war and Brusiloff was directed to send troops to her aid.

Although he had effected no material change on the Eastern front, Brusiloff had caused Austrian troops to be withdrawn from Italy where they had begun an offensive campaign and thus permitted the Italians to go on with their own offensive operations, and he probably also encouraged the Rumanians to declare war. Had the Russian armies in the north cooperated with him, possibly greater results might have been attained.

Year of 1917. The operations on the Russian front were greatly influenced by the political changes during the year. In March the reactionary government of the Czar was overthrown and a provisional government established under Kerensky. In November the Kerensky government was overthrown and the Bolsheviks came into power under the leadership of Lenin and Trotsky. For the details of the Russian Revolution see *RUSSIA, History*. Previous to the fall of the Czar's government there was an unsuccessful offensive attempted on the Aa River in the Riga district, the prime object of which was to relieve the tremendous pressure on Rumania.

Military Operations During the Kerensky Government. After the breakdown of the Russian offensive on the Aa River, the Russian front was comparatively quiet until the Russian Revolution was well under way. The situation on the entire front was deplorable. Discipline had completely broken down. Generals

were appointed and removed or they resigned. The orders issued by the officers had to be approved by the men themselves. Fraternization between the Russian and German soldiers was carried on to a large extent and could not be checked. The situation could not have been much worse. As a result of this demoralization, the Germans and Austrians were able to remove several divisions from the Russian front for use on other fronts. What fighting was done was spasmodic and of a local character. The Allies looked on the revolution at first with favor as they thought it would result in a more vigorous prosecution of the War but they soon discovered that it really resulted from war weariness. The Kerensky government was urged to renew hostilities but it was not until the middle of the year that operations could be renewed. Even then there was little hope that anything could be accomplished by the northern armies as they had been influenced by German propaganda and by the events in the capital.

Brusiloff, who was now commander-in-chief, therefore decided to assume the offensive with his old armies, now commanded by Guter on the Austrian front, as these armies had been less affected by the revolution than those in the north. The northern armies were to cooperate in the general advance but it is doubtful if he expected much from them.

The operations of the southern armies began on July 1 and, as in the preceding year, the Russian armies swept all before them for about two weeks and advanced about 30 miles on a front of 100. This attack compelled German Headquarters to bring some of their best shock troops from the Western front. The counter-attack of these troops was made against the left flank of the Russian group of armies July 19 and it was at once discovered that the Russians were no longer the disciplined troops of the previous years. The left army was routed, and as disintegration began in the other three, all the armies retired across the frontier and for the first time since the beginning of the War there were no Russian troops in Galicia. The northern Russian armies made some isolated attacks but without success.

In August, in the extreme north, the Germans captured the port of Riga which had resisted all their efforts of the preceding year. This was followed by the occupation of the islands at the mouth of the Gulf of Riga and the landing of troops on the coast of Estonia to the east in preparation for an advance on Petrograd if necessary. However, the Kerensky government was replaced by that of the Bolshevik government in November and an armistice was declared between the new government and the Central Powers early in December. Military operations on the Russian front now ceased as the armistice was later followed by the treaty of Brest-Litovsk (see *RUSSIA*).

Military Operations Under Bolshevik Government Until Nov. 11, 1918. After the Bolsheviks had made peace with the Central Powers, their attempts to pacify that part of Russia which remained in their hands were rather unsuccessful. A considerable army of Czecho-Slovaks was roaming around the central part of Russia, attempting to reach Vladivostok and then join the allies in order to down their hereditary enemies, the Austrians. These men had deserted from the forces of the Central

Powers or had been taken prisoners and had later fought with the Russians. After Brest-Litovsk they received permission to cross Siberia. For some time their relations with the Bolsheviks were very friendly, then Moscow ordered them disarmed; the Czecho-Slovaks resisted and conflicts occurred between them and the Soviet forces. The first battles began in May and continued throughout 1918.

When it became known that the treaties of peace between Germany on the one hand and Finland, Russia, Rumania, and the Ukraine, on the other, were to be used by Germany as a means for making these countries subservient to Germany, the Allies determined upon a certain amount of military intervention in order to try to save something from the chaos that existed in Russia. The Allies seized the region around the Murman coast, with the cities of Murmansk, Kola, and Kem (July, 1918). The purpose of this was primarily to prevent the Germans from capturing the supplies that the Allies had landed at the Arctic terminus to the Murman railway completed during the War. The Americans furnished a small force for this expedition.

In July, 1918, it was also announced that the Allies after a long period of consultation had determined to send a combined force of men to Vladivostok to aid the Czechs as far as possible, and also to attempt to break up the armed bands of Austrian and German prisoners who were the main part of the Bolshevik forces. Therefore 10,000 Americans, 10,000 Japanese, and smaller numbers of French and British were placed under the command of General Otani (Japanese), and despatched to Vladivostok in August. Maj.-Gen. William S. Graves was placed in command of the American troops. For further details see *SIBERIA*.

ITALIAN FRONT

Italy's entrance into the war in May, 1915, which the Allies hoped would relieve the pressure on Russia, had two main movements: (1) to the north, to close the passes of the Alps against invasion; (2) to the northeast, to cross the Isonzo and take Trieste. The Isonzo line was reached, but the operation was not completed. An Austrian invasion from the north (May, 1916) was checked mainly by an opportune Russian drive into Galicia. After a successful attack against Austria the Italians were compelled to beat a precipitous retreat to the Piave in 1917. From there they organized the blow that crushed Austria in 1918.

Year of 1915. As a result of an agreement between Great Britain, France, and Italy, known as the Pact of London, Italy declared war on Austria, May 23, 1915. The Italian army on a peace footing consisted of 12 army corps or 25 infantry divisions, which at war strength without reserves would give an army of about 375,000 men. The division consisted of two brigades of infantry, about 12,000 men, and one regiment of field artillery with 30 guns. Each regiment of infantry had a section of two machine guns. The cavalry consisted of 20 regiments which were to furnish the corps cavalry and independent cavalry divisions. Of heavy artillery there were four regiments of four batteries each, equipped with 6-inch howitzers which were to be assigned to armies. The Italian army entered the campaign with an in-

sufficient equipment of artillery, which was gradually increased in the course of the War.

The work before the Italians was simple in respect of conception, difficult in point of execution. The configuration of the frontier at once fixed the nature of the task. It was absolutely essential to close the passes of the Alps from Switzerland eastward in order to protect the flank and rear of their armies on the Isonzo line and to prevent invasion of Italy from the Trentino. This condition secured, the task of the remainder of the forces was to cross the Isonzo, for it must not be forgotten that Italy's material objective was Trieste with the Istrian Peninsula.

Four armies took the field, two on each frontier, the northern and eastern. A fifth force, composed of Bersaglieri and Alpini, was designated for operations in the Carnic Alps. Gen. Count Luigi Cadorna, the chief of the general staff, was in general command, although the armies were under the nominal leadership of the King. On May 24 the frontier of the Trentino was crossed and two weeks later the road to Verona was closed. During the opening days of the campaign in this region the Austrians had opposed but slight resistance to the forward movement of the Italians because of the events on the Eastern front. Farther west the Italians closed the gateways opening southward into the valley of the Tagliamento after severe fighting. In the Trentino as a whole the Italians managed to get control of most of the roads leading into their own country.

The nature of events on the eastern frontier was almost wholly determined by the obstacle forming the line of separation between the contending armies, i.e. the Isonzo River. From its left (Austrian) bank rises ridge upon ridge, whereas the right bank from which the attack must come, below Gorizia, is flat, the Friuli plain. In crossing the river here, therefore, the Italians would be compelled to fight uphill. The rectangle Gorizia-Gradisca-Trieste-San Daniele is occupied by the Carso plateau, with hills from 150 to 1700 feet high. This plateau would have to be taken, or at least a passage opened through it, before Trieste could be reached. On May 24, Italian troops occupied various small towns just across the frontier. Their troubles began when they undertook to cross the Isonzo, for soon after reaching it they found it in flood. Their difficulties were increased by the failure of the cavalry to seize the bridges at Pieris. A dash for these bridges would have insured a crossing and might have gained possession of a part at least of the Carso plateau. As it was, the Austrians blew up the bridges before any Italians got across. The flood subsiding on June 5, a crossing was made at Pieris, and Monfalcone occupied. But now a fresh obstacle presented itself; the Austrians flooded the low country at the foot of the Carso plateau. The advance was thus blocked, and operations along the entire line delayed. After three unsuccessful attempts to make another crossing of the river just above Sagrado, the Italians finally succeeded on June 24. By the 27th they had obtained a bridgehead on the Isonzo and a line of advance to the Carso plateau. This formed part of a general struggle over the whole line from Plezzo to the sea. The conflict was necessarily intensified at certain points, such as Gorizia, Plava, and Tolmino.

Gorizia lies in a bend of the river, and is

dominated by the hills behind it stretching away into the general mountain system. On the west bank, Monte Sabotino, itself commanded by the hills on the eastern bank, likewise controls the position; from Sabotino run the Podgora heights well below (south of) Gorizia. Between Podgora and Gorizia is open ground 3 miles wide, bounded on the southeast by the river. Sabotino and Podgora, thoroughly organized defensively by the Austrians, were unsuccessfully attacked by the Italians at the end of May. They were slightly more successful at Plava. On the 17th of June, after heavy fighting, they gained the summit of the hill controlling this town. They held the hill thereafter in spite of the efforts of the Austrians to win it back, but were unable to extend their holdings on the left bank. At Tolmino the river turns 90 degrees from southeast to southwest. In the bend stand two hills joined by a saddle, Santa Maria and Santa Lucia. These were held by the Austrians, and formed with Sabotino and Podgora the only positions retained by them on the west bank of the Isonzo. The resistance offered at Tolmino was more serious than apparently the Italians had expected. Their attempt to seize it by sudden attack failed, and they were compelled to proceed against the place by regular investment. In the meantime they were more fortunate to the northwest at Caporetto, which they had occupied on the first day of the War. By June 23, the Italians had succeeded in getting into positions from which they threatened the Plezzo valley. They now came down from the north against Tolmino. In August they attacked Santa Lucia and Santa Maria, but were compelled to resort to trench warfare. Later in October the offensive was resumed, without, however, succeeding in dispossessing the Austrians. At the end of the year the Italians had gained one of their points. They had closed the gates of the northern frontier, and held the keys. On the other hand, they were unsuccessful on the Carso. A period of relative quiet then prevailed.

1916. Austrian Attack in the Trentino. The Austrian plans for 1916 contemplated an attack on the Italian front before the Italians recovered from their unsuccessful campaign of 1915. Inasmuch as they selected the Trentino front, which was largely mountainous, they were compelled to wait until May before beginning operations, so that the snow would have a chance to melt. During the winter and spring, the Austrians were concentrating troops in Trent, collecting them from the Russian and Serbian fronts, as well as from the interior. The advance was to be made over the mountains between Lake Garda in the west and the Brenta River in the east. In this section there were a number of valleys which led to the crest of the mountain boundary and thence to the plains of Italy. The Austrian forces, which were concentrated, however, were entirely too weak to accomplish the object set before them and did little more than divert interest from the Isonzo front.

The front to be attacked was held by the 1st Italian army, which was ill prepared for modern warfare and which was led by an overconfident commander, who had taken little care to fortify his position, which he knew for months was going to be attacked. The attack began in the middle of May and was preceded by a heavy bombardment, which, being new to the Italian

troops, had a very demoralizing effect upon them. The result was a slow but steady advance on the part of the Austrians. At the end of two weeks, Asiago and Arsiero had been captured. By this time the attack had exhausted itself and this fact, coupled with an attack by the southern group of Russian armies, forced the Austrians to begin to recall their troops. They fell back to a position intermediate between their advanced and original positions. No serious fighting followed this withdrawal, as the Italians returned to their attacks on the Isonzo front.

Operations on the Carso Plateau. While the Austrian attack was being carried on in Trentino, the Italian II and III armies continued their operations against the Austrian positions north and south of Gorizia. By August their work had produced results which made a successful assault feasible. The attack was delivered north and south of Gorizia on August 6. It was preceded by a bombardment of great intensity. By the 9th the Austrian first line had been broken and by the 12th they had been driven back 3 miles to their second position. Gorizia had been evacuated on the 9th. North of this town all the Austrian positions on the heights of Sabotino and Podgora west of the Isonzo were captured. During the remainder of the year attempts were made by the Italians to advance farther along the Carso plateau, but the Austrian lines proved too strong.

1917. Italian Spring and Summer Offensive. The winter on the Italian front was very severe and of long duration. The time was spent in increasing the entire military establishment on the front and in preparing to meet an Austrian attack on the Trentino front and in organizing an Italian attack on the southern part of the battle line. The plans of the Italian General Staff were as follows. First, to engage the enemy on the entire front from Tolmino to the sea in an intense artillery action which would leave him doubtful as to the real direction of the decisive attacks; then to attack along the Isonzo with the II and III armies. The II army was to seize the heights on the east bank of the Isonzo from Gorizia about 6 miles northward. When the Austrians concentrated here the III army was again to press forward in the main attack along the Carso plateau in the south.

Operations were begun on May 12, and on May 14, the infantry advanced from Plava and Gorizia. On the entire front the Austrians presented stubborn and determined resistance. The first phase of the assault lasted until May 22, by which time the Italians had captured the Austrian first line. The Austrian second line, however, was on heights which overlooked and dominated the first line. In order to create a diversion the Austrians unsuccessfully attacked in the Trentino region, May 19 to 22.

On May 23 the Italian infantry began the second phase of the battle. After tremendous artillery preparation, it attacked on the south edge of the Carso plateau from Castagnavizza to the sea. Over 100 aeroplanes aided in this battle. On the next day the battle was resumed and extended from Gorizia to the sea. Allied monitors bombarded the extremity of the Austrian lines with heavy naval guns. The Italians advanced in the face of exceedingly stubborn resistance—counterattacks, violent shelling, and aerial bombardments from machines

flying near the ground. The Italians advanced their lines about 2 miles, but had not accomplished all that was expected, inasmuch as the key position was 2 miles farther on from the new Italian front line.

The Austrians, on June 1, began an offensive which compelled the Italians to retire somewhat from their newly-won positions. On account of conditions in Russia they were able to bring up great quantities of men and material from the Eastern front. On June 3, a general attack from Mount San Marco to the sea was begun and lasted with unabated intensity for three days. It was at first successful, driving the Italians back about $1\frac{1}{2}$ miles. A counterassault by General Cadorna in the Trentino compelled the Austrians to give up this offensive, which was supposed to neutralize the Italian gains in the latter part of May. During July and the first part of August the opposing forces battled back and forth in an attempt to get advantageous positions. On the night of August 18, the Italians began a spectacular offensive from Tolmino to the sea, a front of approximately 37 miles. The attack was made by the II army, under General Cappello, which operated on the Bainsizza plateau, Monte Santo, and Monte San Gabriele, and the III army under the Duke of Aosta, which operated in the Vippsacco and Brestovizza valleys, and in front of Mount Hermada, the keypoint to the Carso plateau. These armies were aided by Italian and British monitors in the Gulf of Trieste.

The Italians paved the way for their advance by a great engineering feat. They had diverted the course of the waters of the Isonzo River from its bed above Anzovo and had built bridges across the shallow stream that remained. This work was done at night and at daylight the stream was redirected to its regular channel. By means of these bridges and some pontoon bridges hastily constructed, the Italians crossed the river on the 18th and gained a foothold on the northern part of the Bainsizza plateau. At the same time Cappello's right wing began to envelop Monte Santo. These two movements compelled the Austrians to retire to the easternmost edge of the Bainsizza plateau. From the nature of the Austrian defenses, it was quite apparent that the Austrian Staff thought this plateau impregnable. On August 24, the Italians occupied the summit of Monte Santo, 2240 feet high, but attempts to reach the summit of Monte San Daniele were futile.

The Duke of Aosta had been busy in the south in the meanwhile. His object was to surround the Hermada Mountains, which were the key to the Carso plateau and Trieste, and to occupy the Vippsacco valley. He was unable to break through the Hermada Mountains, however, and spent the entire month in fruitless efforts.

At the end of September, General Cadorna reported to his allies that his offensive of 1917 was ended. In the attacks north and south of Gorizia his losses in killed, wounded, and missing were 350,000; with losses due to sickness, his casualties were about 700,000. The II army especially suffered from the latter cause. It is probable that the Austrian losses were about as great, as they appealed to the German G. H. Q. for assistance.

Austro-German Counterattack and Italian Retreat. As has been described above, the main Italian army was striking on a comparatively limited front on the Bainsizza plateau.

This attacking force was composed of seasoned veterans. The armies protecting its flanks were of unequal strength and were used for different purposes. Those on the upper Isonzo were Territorials, i.e. older men who in peace times are held in reserve. They extended from Tolmino to Plezzo and were to protect the flank of the Bainsizza army. The troops on the lower Isonzo were veterans, who were thrusting forward on the Carso plateau *pari passu* with the troops on the Bainsizza and who were ultimately to march on Trieste.

The German General Staff had been receiving calls for help for some time and at last gave heed to them, sending the XIV Germany army, consisting of six or seven divisions. The strategy of the Austro-German plan was to strike at the unseasoned troops on the upper Isonzo, break through, and then cut the lines of communications of the other two armies by outflanking them. This plan was put into operation and worked exceedingly well. The task was made easier by the collapse of Russia, a superiority of artillery, surprise, socialist propaganda, and cowardice, which General Cadorna claimed was exhibited by his troops on the upper Isonzo.

The battle began on October 24, with a bombardment of the Plezzo-Tolmino front and the northern flank of the Bainsizza plateau. Under cover of these guns the Germans and Austrians broke through the front line trenches at Plezzo and Tolmino and crossed to the western bank of the Isonzo. Converging from these points on Caporetto, the Germans opened the way down the valleys of the Natisone and Judrio Rivers. This move threatened the rear of the Bainsizza and Carso armies, and compelled them to begin a hasty retreat. The retreat from the plateau through Gorizia across hastily constructed bridges over the Isonzo became a rout. On the 28th, Civadale was taken, which opened up railway communication with Udine, the seat of the Italian Headquarters. This advance also compelled the IV Italian army, which was guarding the frontier in the Carnic Alps, to abandon the passes on the frontier and retreat down the streams flowing into the Tagliamento and Piave Rivers. On October 30, Udine fell, and by November 1, the Austro-German forces had reached the Tagliamento River, which they crossed in scores of places after a slight pause. The Italian II army was no longer a fighting unit. The next river flowing into the Gulf of Trieste was the Livenza. This offered very little chance of resistance and was defended merely to give more time to prepare the line of the Piave River, from 10 to 20 miles farther west. French and British infantry and heavy artillery, which were sorely needed, were arriving daily in ever-increasing numbers, and being sent to the critical points. The French sent six divisions and the British five. At this stage a change in command was made. General Cadorna was succeeded by General Diaz, who was to be assisted by Generals Badoglio and Giardino. Cadorna was assigned to the Supreme War Council, which was organized largely as a result of the Italian disaster (see above). Reserves were held on the Adige line in case the Italians were unable to hold the Piave. The Adige line was very strong naturally, and was practically incapable of a flanking movement such as had won all the rivers so far gained.

The line eventually taken by the Italians ran

along the Piave River from the Adriatic to the foothills of the mountains, thence westward across the Mount Grappa group of mountains to the Brenta River where it connected with the lines of the I Italian army, which prolonged the line across the Asiago plateau and through the mountains to Lake Garda. The IV Italian army held the line between the two rivers, while the III held the line along the Piave. The Austro-German attack had by this time exhausted itself and neither the X or XI Austrian armies in the north nor the German and Austrian Isonzo armies were able to make any impression on the new line. During December, therefore, the German divisions were withdrawn. The Austro-Germans had taken almost 4000 square miles of territory, 300,000 prisoners, and 2700 guns. The winter months, which were very severe, were spent by the Italians, with the aid of the British and French, in strengthening the Piave line, particularly at its weakest point, in the mountains.

1918. The Austrian Failure. The long looked for offensive on the Italian front, which was expected to finish the work of 1917, developed in June, 1918, and extended along the whole front from the Asiago plateau to the sea, nearly 100 miles. The Austrian plan of attack was as follows: Field Marshal von Hoetzendorf was to break through the Allied positions on the Asiago plateau, and at Monte Grappa and Monte Tomba, and then march down the Brenta valley, and debouch on to the plains by way of Bassano. In conjunction with Hoetzendorf, General Borovic was to cross the Piave between Montello and the upper stretches of the Piave delta, and thus outflank Venice and leave it the alternative of surrender or destruction. The capture of Montello would assure the Austrian domination of several important railway centres and possibly cause a huge disaster. The offensive was well planned and everything was done to insure its success. The Austrians were well supplied with gas shells, smoke shells, rafts, pontoons, and every other means of carrying on modern warfare. From the outset, the attempts to reach the manufacturing heart of Italy were doomed to failure. In the mountain region the opening attack took the first line trenches from the British and French defenders. Less than two days later, the Allies, at the point of the bayonet, had recovered all the ground lost and some more besides.

The Austrians were little more successful along the Piave. Their success was largely due to the effective use of "tear" shells and smoke screens. They crossed the Piave at several places and, by the 16th, they reached Fossalta and threatened to cross the canal of the same name, which branches off from the Piave at Fossalta and extends to Porte Grand. Nature now came to the aid of the Italians, in the form of exceedingly heavy rainstorms, which made the Piave a swollen flood. This had two effects: first, by washing away nearly all the bridges, it cut off almost completely the Austrians on the western bank of the river, and second, it enabled Italian naval monitors of light draft to go up the river and heavily bombard the Austro-Hungarian positions. On June 23, the Italians began an offensive all along the western bank against the isolated Austrian positions. By the first week in July, not only had the Allies driven the enemy back to its old positions, but in some cases had captured ground that

had been lost in 1917, notably the delta at the mouth of the Piave. The offensive and counter-offensive had now exhausted themselves and General Diaz held the line of the Piave until ordered by Foch to open an offensive.

Complete Collapse of Austria-Hungary. Austria-Hungary was the third member of the Central Alliance to make a separate peace with the Allies (see below). An armistice amounting to unconditional surrender was signed on November 3, after Italy and her Allies had secured one of the most decisive victories of the War in which 63 Austrian divisions were utterly routed by 51 Italian divisions, 3 British, 2 French, and 1 Czecho-Slovak division, and the 332d American infantry regiment. On November 4, the Italian War Office reported "The Austro-Hungarian Army is destroyed. It suffered heavy losses in the fierce resistance of the first days of the struggle, and in pursuit it has lost an immense quantity of material of all kinds, nearly all its stores and depots, and has left in our hands about 300,000 prisoners, with their commands complete, and not less than 500 guns."

The main attack was made on October 24, when the Italians and their allies began a heavy artillery fire in the mountainous regions around the Asiago plateau and Monte Grappa. The first Italian infantry assault forced a passage of the Orme River and captured Monte Salarole, and parts of Mounts Prossolan and Pertica. By the 28th the allied armies had forced their way across the Piave and were driving the enemy precipitously before them, with cavalry units well in advance of the infantry. The Austro-Hungarians were in a disorderly rout and made absolutely no attempt to carry along or destroy their munitions and supplies. Vittorio was reached on the 30th, and on the next day Italian forces reached Ponte nelle Alpi, which separated the Austrian army in the mountains from that along the Piave. The capture of the Vadal Pass on the same day penned 15 Austrian divisions between the Brenta and Piave Rivers.

By November 1, four armies had reached the Livenza and cavalry outposts had operated almost to the Tagliamento. On the 2d, the Italians had advanced in the Trentino as far as the Sugana valley and by the next day, when the armistice was signed, Rovereto and Trent were occupied. Italian and British cavalry also had entered Udine and had overrun the plains surrounding it. On the last day of the fighting, Italian land and sea forces had occupied the great Austrian naval base and seaport at Trieste.

On October 31, Austria-Hungary sued for an armistice. Terms were handed to her on the next day, which were accepted. They went into effect on November 4. The more important clauses provided briefly for the demobilization of the Austro-Hungarian Army on all fronts, the evacuation of all occupied territory, wherever held by Austro-Hungarian troops, repatriation of Allied prisoners of war, and the occupation of any strategical points in Austria-Hungary by the Allies that they desired.

BALKAN FRONT

Serbia, Bulgaria, Saloniki. War was declared by Austria on Serbia June 28, 1914, and at once Austrian forces began to concentrate on the Serbian frontier. Serbia began

her mobilization two days before Austria declared war. The Austrian plan was to invade the northwest corner of Serbia; one corps was to cross the Save River at Shabat and three were to cross the Drina River from Bosnia. Accordingly, after demonstrations on the Danube, on August 12, she sent her first troops over at Losnitza on the Drina and on the same day she crossed the Save near Shabat. Other troops crossed the Drina at Zvornik and Linbovia. The direct objective of the Austrians was to reach Valievo, and thence Kraguyvats, the site of the national Serbian arsenal. The commanding generals of the respective sides were Potiorok (Austrian) and Putnik (Serbian).

The line of the Austrian invasion being known, the bulk of the Serbians moved to meet it in the direction of the Jadar valley, while sending troops to the northwest to offset the invasion from Shabat. In the meantime the Austrians moved up the Jadar, and the Serbians intrenched at Jarebitze, across the valley. The battle opened in earnest August 16, on the Serbian right. The action, lasting all day, resulted in the defeat of the Austrians, and in bringing to naught their plan to join their forces on the Jadar. It also left the Serbians free to operate against Shabat, which they entered on the 14th. While this operation was going on, the Austrians farther south had been retreating to the Drina, and the Austrian invasion had failed, due to overconfidence and exposing their columns to separate attacks by the Serbians who were thoroughly acquainted with the country.

On September 1, the Serbs invaded Syrmia, a province lying between the Save and the Danube. On the whole this step was ill-advised, and in any case of short duration, for now the Austrians were about to launch another invasion, like the first, from the line of the Drina, under the same general.

After six weeks of position fighting the Serbs retreated, abandoning the Matchva and the Tzer. On November 1, the Austrians again invaded Serbia from the same frontier with two armies, composed of four active corps and reserve divisions. Valievo was entered on the 11th. The Serbs now took up a position down the Kolubara River to the Lyg, up which their line turned to the southeast; the heights south of this position were occupied and protected by earthworks. On the 11th, the Austrians attacked towards Lazorevatz, and moved against a detached force 20 miles southwest guarding the valley of the western Morava. On November 20, the first of these attacks proved successful and drove in the Serb centre. By the 24th, the action had extended over the whole front with continued success falling to the Austrians. They had now succeeded in extending their front to Belgrade, which they entered December 1, and thus had cut the region in two, driving back the Serbs in the direction of Kraguyevats, on a line from the Belgrade railway to the western Morava. The situation was now saved to the Serbs by the resumption of the offensive. On December 2 they attacked, and in the next few days drove back the Austrians right and centre to Valievo. The advance was equally successful in the other sectors. Its result was an interposition between the three Austrian corps in the south and the two farther north. The three southerly corps retreated as well as they could on the frontier.

The action now turned towards Belgrade, towards which the Austrians were steadily driven back. The evacuation of the capital occurred on December 14 and 15.

It is difficult to understand the object of Austria's operations in Serbia during 1914 when she needed all her troops on the Russian front. It was highly improbable that the Serbians would cross the Danube and an invasion of the mountainous provinces of Bosnia and Herzegovina could have been easily defeated by the local corps stationed there. It was to her interest to remain on the defensive on this front.

1915. Bulgaria. In October, 1915, Serbia was once more called upon to defend her territory, for Bulgaria had finally decided to cast in her lot with the Central Powers (see BULGARIA). Accordingly her armies crossed the Serbian frontier towards Nish, striking in conjunction with the Austro-German forces which had already begun their invasion from the north under the leadership of Von Mackensen. Meanwhile French and British troops, under an arrangement with Venizelos, the prime minister of Greece, debarked at Saloniki, and were hastening up along the Saloniki-Nish railroad. In the first week of October the Austro-German army crossed the Danube near Belgrade and at Semendria, while other armies attacked farther west along the Drina and Save Rivers. Bulgaria's first operations were directed towards Nish; but realizing the danger of the arrival of Allied reinforcements at Saloniki, the Bulgarians then developed their main attacks farther south against the railroad at Vranja and Vilandovo. The advance of the Austro-German columns was at first slow, for by the end of October they had gained, advancing on a 100-mile front, only from 25 to 40 miles south of Belgrade. In the south, however, the Bulgarians having seized the Nish-Saloniki railway at Vranja, promptly confirmed their grip on the enemy's line of supplies by taking the important city of Uskub (October 22), and Veles, 25 miles farther south.

The Germans took the Serbian arsenal at Kraguyevats during the second week in November. In the meantime, the other Austro-German columns had reached the east and west line of the Western Morava before the middle of the month. The fall of Nish was not long delayed, upon a heavy bombardment by the Bulgars. A route to Constantinople had already been opened via the Danube, when Germans and Bulgars joined hands near Orsova.

Meanwhile the Anglo-French forces from Saloniki held the railroad from Krivolak south to the frontier, and had gained some successes against the Bulgars around Strumnitza. The French were scarcely able to maintain their position on the Vardar and Cerna Rivers, and the small British force was but little in evidence north of Doiran.

The remaining strokes in Serbia's defeat followed quickly. Sienitza, Novibazar, and Mitrovitza (the last the temporary Serb capital) fell in rapid succession before the Austro-German columns. Teutonic and Bulgarian invading forces joined hands at Prishtina, on the railroad branch south of Mitrovitza. On November 30, the two remaining cities of importance, Pristend and Monastir, were lost to Serbia. The fugitive Serb army was driven either into Montenegro or Albania. At the beginning of December, the main object of the German-Bulgar campaign in Serbia had been achieved. The

Serbian army had been eliminated as a fighting force and the surviving Serb troops, fewer than 100,000 men, had retreated into Montenegro and Albania en route for the Adriatic shores.

The retreat of the Serbs from Katchanik left the French left flank, on the Cerna River, in a critical position. The retreat of the Allies, however, was skillfully conducted, and they succeeded in escaping to neutral territory, where they fortified themselves at Saloniki, with the intention of holding their position at all costs and using it as a base for future operations.

Year of 1916. Montenegro was conquered by the Austrians in January, 1916. The Austrians then proceeded to take Scutari in Albania (Jan. 26, 1916), and joined hands with the Bulgars, east of Durazzo, February 17. The Italians abandoned the place February 26, and the Austrians now advanced against Avlona. The remnant of the Serbian army was transported by the Allies from the Albanian coast to the island of Corfu to undergo reorganization. After a few months' rest the refitted army was taken to Saloniki to reinforce the French and British.

When Rumania decided to enter the War on the side of the Allies (see below) one of her terms was that the Allies should begin an offensive from Saloniki to prevent Bulgaria from taking part in the operations against her. About the first of August, therefore, General Sarrail was made commander-in-chief of the Allied forces and began operations in the centre against the Bulgarians on his front. The Bulgarians replied by invading Greece and occupying the line of the Struma River and the fortress of Kavala on the coast of Macedonia and the town of Florina west to Lake Ostrovo. Sarrail, not being able to advance in the centre, transferred his offensive to the west and the French and Serbs captured Florina and advanced into Serbia, capturing Monastir about the end of November. This campaign was of little assistance to the Rumanians. The failure of Greece to declare war on Bulgaria after the invasion of the country led to the establishment of the Greek revolutionary government under Venizelos at Saloniki and on some of the Greek islands.

Year of 1917. No events of any importance occurred on this front during this year. General Sarrail began an offensive in the spring but gave it up very shortly, accomplishing nothing. King Constantine was forced to leave the country and one of his sons was placed on the throne by the Allies in the course of the year (see GREECE). Greece declared war on the Central Powers and the Greek army was organized and trained to aid the Allies.

1918. Surrender of Bulgaria. The Bulgarians were very much dissatisfied with the terms of the Treaty of Bucharest and resented the action of the German and Austrian governments, which had dictated the terms. Of the Bulgarian army at this time, Ludendorff says: "The Bulgarian army had time for rest and training. But it could not be denied that since March its spirit had visibly deteriorated, owing to bad food and clothing. The irritation against Germany was cleverly fomented by hostile propaganda and by Bulgarians who favored the Entente. The peace of Bucharest and the withdrawal of a few German units to the west added fresh fuel to it."

Bulgaria was the first of the Central Powers

to surrender to Allied arms. This act marked the beginning of the end of the great War. Bulgaria's surrender was the direct result of a brilliant offensive carried out by the Allies under the supreme leadership of Gen. Franchet d'Esperey, who assumed command of the Saloniki front in June, 1918. The artillery preparations began on Sept. 14, 1918, and on the 17th and 18th the Allied right started to advance, as well as the centre. British and Greek troops struck around Lake Doiran, on the right of the Macedonian front; French and Serbian troops struck in the centre, and Italians struck on the left rear and in Albania. By September 22, the Serbians had succeeded in cutting the communications of the I Bulgarian army, operating along the Vardar, and those of the II army and the Germans north of Monastir. This day saw a general pursuit of the armies of the Central Powers on a 90-mile front. On the 23d, the Serbians and French crossed the Vardar. On the 24th French cavalry entered Pirlap. The British entered Strumitza on the 26th, and the Serbians reached Kochana and Veles. The road to Sofia was opened to the victorious Allies. Consequently the Bulgarians sued for a separate armistice. One containing terms of unconditional surrender was granted on the 30th, when active fighting ceased. The last act of the fighting was the occupation of Uskub by the French on the 30th.

A brief summary of the armistice terms, which were purely military, are as follows: Bulgaria was to evacuate all Allied territory, demobilize her army as rapidly as possible, and turn over to the Allies all means of transport. The Allies were to be allowed to pass through Bulgaria if necessary to future military operations; control of the Danube and Bulgarian merchant marine on that river was to be given up; all important strategic points to be occupied by the Allies if they wished; the armistice was to remain in force until a general peace was concluded.

Interest in the Balkans after the signing of the armistice centred in the driving out of Austrian troops from Albania, Serbia, and Montenegro. On October 1, the Bulgarians began to evacuate Serbian territory, and two days later the Austrians began the evacuation of Albania. By the end of the month they were well out of Montenegro also. On November 3, Belgrade was reoccupied and the II Serbian army crossed the Danube and Save Rivers, and on the 10th entered Sarajevo, the Bosnian capital and scene of the assassination of the Archduke Francis Ferdinand and his wife on June 28, 1914.

RUMANIAN FRONT

As has been stated above, the question of Rumania's entrance into the War was settled on Aug. 27, 1916. Her period of neutrality was greatly affected by events on the Russian and Dardanelles' fronts. The failure of the Gallipoli campaign, the Russian retreat, and the invasion of Serbia kept her out of the War in 1915. After Brusiloff's successful advance in June, 1916, Rumania determined to enter the War on the side of the Allies. She frankly admitted that her action was influenced to a great extent by the thought that the time was ripe to put into effect her nationalist policies. She made the following demands upon the Allies before she took the decisive step. Brusiloff was to keep up his offensive, the Saloniki army was to

attack, certain concessions of territory were to be made to her, and she was to be supplied with ammunition, etc. These demands being promised, Rumania declared war. Her reliance on the Allies was too great, however. Her chief weakness was lack of ammunition. As this could be supplied only through Russia, it was inevitable that Rumania should go short, because Russia had scarcely enough for herself, in the first place, and in the second, the Russian Revolution soon put Russia out of the War. This new force added about 500,000 trained men to the Allied cause. Including the reserves, 900,000 men could be put into the field.

The territory of Rumania forms a great letter Y. The base is formed of the province of Dobrudja, which is bounded on the south by Bulgaria, on the east by the Black Sea and on the north and west by the Danube. The two arms are formed by the province of Moldavia, which extends northward between the Pruth River and the Carpathian range of mountains; and the province of Wallachia, which extends westward between the Danube and the Transylvanian Alps. The two mountain chains form a great barrier 350 miles long, separating Rumania from Hungary.

The Rumanian plan of operations contemplated an invasion of Hungary by three armies deployed over this immense front, which were to advance in a number of small columns through the passes and eventually unite on the Maros River near Karlsburg for the final advance to the range of mountains separating Transylvania and Hungary proper. The Rumanians proposed to hold and annex Transylvania, which was largely inhabited by Rumanians. Assuming that even if Bulgaria declared war, her forces would be held by the Allied advance from Saloniki, the Rumanians left a single army to guard the line of the Danube and the Bulgarian frontier.

The plan of the Central Powers was to form a group of three armies for operations in Transylvania and one in Bulgaria. One of the former armies was composed of the scattered troops on the frontier at the beginning of hostilities and the other two were to be new armies organized from reserves and troops on other fronts; i.e. the I Austrian and the IX German. The German army was to be commanded by von Falkenhayn, late chief-of-staff. These new armies would not be concentrated before the middle of September. In Bulgaria, a group under von Mackensen was to be formed of the III Bulgarian army and a number of German and Turkish divisions.

In the campaign which began on August 28, we note the following phases:

Aug. 28 to Sept. 20.	Advance of Rumanian armies into Transylvania and the advance of Mackensen's group into Dobrudja.
Sept. 20 to Oct. 20.	Retreat of Rumanians from Transylvania. Mackensen held in check in Dobrudja.
Oct. 20 to Nov. 10.	Austro-Germans held on the frontier in the north. Mackensen advances in Dobrudja across the Bucharest Constanza railway.
Nov. 10 to Nov. 25.	Austro-Germans penetrate Vulcan Pass and reach the plains of Wallachia. Mackensen held in check in Dobrudja.
Nov. 25 to Jan. 10.	Mackensen crosses the Danube at Slatova with his German and Turkish forces and with the Austro-German forces from the north drives the Russian and

Rumanian forces out of Wallachia and across the Sereth River. The Bulgarians left in the Dobrudja hold the Russo-Rumanian forces in check until the latter retire from the Dobrudja, when the Bulgarians cross the Danube and rejoin Mackensen.

On August 28, the I, II, and IV Rumanian armies crossed the mountains; the I army in the west from the Danube to the Red Tower Pass; the II army in the centre between the Gyimes and Tarsburg Passes, and the IV army north of the Gyimes Pass. The II and IV armies met with little opposition and by September 20 were on the meridian of Fogaras between the Maros River and the Carpathians. The various columns of the I army met with greater opposition, and had barely reached the base of the mountains. At the Red Tower Pass the column had taken Hermanstadt and at the Vulcan Pass the town of Petrosiny. The division on the Danube had taken Orsova at the Iron Gates. While the Rumanian armies were advancing triumphantly in Transylvania, Bulgaria declared war on September 1 and immediately von Mackensen crossed the frontier into Dobrudja, and on September 6 captured the larger part of two divisions left by the Rumanians on the south bank of the Danube at Tutrakan. This unexpected blow caused the Rumanians to divert the commander of the II Rumanian army—Averescue—with some of his divisions from Transylvania to the Dobrudja to check the advance of Mackensen. This he was able to do before Mackensen reached the Bucharest-Constanza railway.

Such was the situation about September 20 when the I Austrian and IX German armies had completed their organization and were ready to move. Their plan was first to secure the Vulcan Pass and then penetrate the gap between the II Rumanian army at Fogaras and the I army at the Red Tower Pass and attempt the capture of the Rumanians in the vicinity of Hermanstadt by seizing the pass in their rear. The operations were successfully executed; both passes were captured, with a large number of Rumanian troops. Leaving guards in the passes, the main body of the two armies moved eastward against the II Rumanian army, which was obliged to seek safety by falling back to the mountain passes. The IV Rumanian army was compelled to conform to this movement and by October 20 both armies were back in the mountain passes. The Russians now relieved the IV Rumanian army so it could be used further south. During this period Mackensen was unable to advance and called for reinforcements.

As a result of the retreat of the Rumanian armies in the north, Averescue was sent to his old command, the II army, and strenuous efforts were made to hold the I Austrian and IX German armies at the mountain passes. In this the Rumanians were successful during the latter part of October and the early part of November. During this period, however, Mackensen, having received reinforcements, broke through the Rumanian defense in Dobrudja and succeeded in advancing across the Bucharest-Constanza railway and capturing the seaport of Constanza. A short distance east of the railway he was obliged to again intrench, as the Rumanians had been strongly reinforced by Russians and he met with temporary defeat.

Early in November the Austro-Germans north

of the mountains received further reinforcements and made a determined effort to reach the Wallachian plains by the Vulcan Pass, where the Rumanians were weakest. After 10 days' hard fighting they succeeded in reaching Craiova and about November 25 were on the Aluta River facing east. As soon as he was assured that the northern armies would reach the Wallachian plains, Mackensen decided to leave the Bulgarians to hold his trench line in Dobrudja and transfer his German and Turkish troops to the north bank of the Danube. These troops were ferried across the Danube November 23-25 at Sistora and Mackensen assumed command in Wallachia. The Rumanian division that had taken Orsova was now wholly cut off and was later compelled to surrender.

From November 25 to January 10, the Russo-Rumanian armies were driven steadily eastward and the passes in the north were evacuated in succession. At the close of the operations the opposing armies were facing each other along the Sereth River. The Dobrudja was evacuated by the Russo-Rumanians and most of the Bulgarians joined von Mackensen on the north bank of the Danube. Moldavia still remained in the possession of the Rumanians, who moved their capital to Jassy, as the Russians still held the passes of the Carpathians.

In October, a French Military Mission reached Rumania, and after the close of hostilities, the Russians took over the front and the Rumanian army was reorganized and trained by French officers.

1917. In July, 1917, the Rumanians were again to assume the offensive in cooperation with Brusiloff's offensive under the Kerensky government. The Russian advance, however, soon terminated in a rout and operations ceased. In December, the Bolshevik government entered into an armistice with the Central Powers and Rumania was compelled to follow suit.

1918. After the surrender of Bulgaria, September 30, Rumania again took up arms but the surrender of Austria followed so quickly that the Rumanian forces were not engaged.

TURKISH FRONT

The strategic importance of Turkey from the Germanic point of view lay in keeping supplies from Russia through control of the Dardanelles. Activities on the Turkish front manifested themselves in five distinct phases: (1) Armenian front (a) Turkish thrust against Russia (1914-15), (b) Russian campaign (1916) forcing the Turkish armies behind Trebizond, Erzerum, and Bitlis line to the west and threatening Bagdad on the south; (2) British advance in Mesopotamia; (3) Turkish attack on the Suez Canal; (4) Gallipoli campaign by Franco-British forces, (5) conquest of Mesopotamia and Palestine with resultant collapse of Turkey.

War was begun by Turkey and Russia on Oct. 31, 1914, through the activities of the Turkish fleet, but formal declaration was withheld by the Allies until the first week in November. As a matter of fact Turkey began to mobilize at the end of July, 1914, and by the end of October it was estimated that she had 500,000 men in her army with 250,000 more at the depots. The strength of her army on a peace basis was estimated at 250,000. Attempts had been made by German officers to reorganize and train the Turkish army just previ-

ous to the Balkan wars, but without much success. The staff and supply services were woefully weak, and the great quantities of artillery lost in those wars were scarcely replaced. The country was divided into four military districts with headquarters at Constantinople, Erzingan in Armenia, Damascus in Syria, and Bagdad in Mesopotamia. At the beginning of the War, Allied troops appeared in the Caucasus district of Russia on the Armenian border and in Mesopotamia a British force landed at Fao at the mouth of the Shatt-el-Arab River and secured a base for operations in Mesopotamia.

1915. **Armenian Front.** On the Armenian front the Russian base for operations was Kais and the Turkish base Erzerum, opposite Kars. Each city was about 50 miles from the frontier and about midway between the Black Sea and Mount Ararat. About the middle of November, 1914, a Russian column crossed the Turkish frontier and advanced about half the distance to Erzerum along the roads leading to that base. In the meantime a Turkish force advanced against the Russian column, while a corps at Trebizond attempted to reach the flank and rear by way of Kardahan. The Turks crossed the frontier but were defeated and the Trebizond unit got no farther than Kardahan. The Turks recrossed the frontier and operations ceased for the remainder of 1915 because both the Russian and Turkish troops were needed elsewhere. Persian territory was invaded and some operations of minor importance carried out near Tabriz.

Mesopotamia. The Turks had two corps in the Tigris valley, one at Mosul and the other at Bagdad, 200 miles farther south. The British occupied Basra early in November, 1914, to gain a base for operations in Mesopotamia and to protect the British oil fields in southern Persia. The operations of this force were conducted by the Indian government. The force was gradually increased to an army corps and in April, 1915, General Nixon was sent to command it. About the end of May, General Townshend started north up the Tigris with the 6th Indian division, accompanied by naval vessels of light draft. In a month, it reached Amara about 100 miles up the river with only slight opposition. During July the 12th Indian division advanced about 100 miles up the Euphrates.

The advance had been accomplished so easily that the British commanders determined to combine the two forces and advance up the Tigris to Kut el Amara, which is about 100 miles south of Bagdad. The expedition started on August 1, and Kut was reached about the last of September, with only one engagement of any size. The British were successful in this. The pursuit was kept up until the British-Indian army reached Azizieh about halfway between Kut and Bagdad. The problem before the British was now whether to continue on to Bagdad or wait at Kut for reinforcements. Townshend favored the latter course but for political reasons General Nixon overruled him and ordered the advance on Bagdad. Consequently an advance was begun from Azizieh in the middle of November and by the 21st Townshend reached Ctesiphon, about halfway between Azizieh and Bagdad. Here the Turks were strongly entrenched. Townshend unsuccessfully attacked on the 22d. He remained in front of the Turkish positions until the night of the 25th, when,

upon learning that the Turks were about to be reinforced, he began a retreat on Kut. He reached this place December 2, closely pursued and harassed by the Turks. He determined to hold it until relief arrived and as the year closed he was invested by the Turks and his position was very precarious.

Egypt. As early as 1914, the Turks planned a campaign against Egypt, in the hope probably of raising an insurrection in that country. The plan of operations called for the crossing of the Sinai Peninsula through a desert 150 miles wide, as well as the Suez Canal. The main column, consisting of three divisions, was to start from Beersheba in southern Palestine. A smaller column was to follow the coast road from Gaza to El Kantara on the canal, and a third column was to follow a caravan route still farther south and reach the town of Suez. The three columns reached the canal about the first week in February. A miscellaneous force defended the canal, Australians, New Zealanders, Indians, English, and Egyptians. All attacks on the canal were easily repulsed and the Turks retreated unpursued by the Allies. No damage was done to the canal and the front remained stabilized for the remainder of the year.

Gallipoli Campaign. The temptation to strike a blow at the vitals of Turkey by taking possession of the Dardanelles, and hence of Constantinople, was irresistible (for a description of the straits, see Vol. VI). Success here would have met with a rich reward. A way would have been opened to supply Russia with the war munitions she so sorely needed; the Balkan question would have been settled out of hand, and in a manner favorable to the Allies. But the entire campaign was mismanaged from the outset; the nature of the effort to be made was certainly not correctly estimated; efforts were scattered; time was lost.

For the naval campaign, reference should be made to the naval sub-division of this article. It opened Nov. 3, 1914, and it was not until the following March that joint land and naval operations were decided upon after a great deal of bickering and hesitation. By that time the Turks had received ample warning, and here, as elsewhere, under German leadership, had made what turned out to be more than ample preparation.

In the Gallipoli Peninsula, nature was on the side of the defense. Furthermore, the Turks enjoyed an advantage in their supply of men, for the bulk of their forces was in the neighborhood of Constantinople and could therefore be drawn upon as needed. Gen. Sir Ian Hamilton was selected to direct the land operations of the Allies. These were to be carried on by a French force under General d'Amade, drawn from north Africa, and by Colonials, Territorials, and some Indians from Egypt and Imperial troops.

On arriving at Tenedos (March 17), selected as his headquarters, Sir Ian made up his mind that the transports had been so badly loaded that he would not undertake any operations until the loading had been corrected. The transports were accordingly sent back to Egypt to be reloaded. Upon their return five weeks had been lost to the Allies and gained to the Turks. The British began their landings on April 25, under exceedingly great difficulties. The Turkish force on the peninsula was in the

neighborhood of 100,000 men, commanded by the German general, Liman von Sanders. The chief landings were made at the tip of the peninsula. Once ashore, the advance was to be made against the village of Krithia, and the height of Achi Baba was then to be carried. At each of the beaches selected the Turks were ready and received the landing party with tremendous fire. Obstacles of all sorts under the water and on the beaches and cliffs were skillfully placed in way of the invaders. The Australian and New Zealand corps (Anzacs) near Gaba Tepe especially distinguished themselves by rushing the Turks with the bayonet, clearing the slopes and securing a foothold on the top. The French landed a regiment on the Asiatic side, near Kum Kale, for the purpose of preventing an attack by gun fire against the transports at the nose of the peninsula. In this they were more or less successful, but at considerable loss to themselves. The result of the work of the 24 hours was that the Anzacs, isolated, were holding a semicircular line against an enemy ever increasing in numbers; at the tip of the peninsula one landing was abandoned, some forces were holding their own but isolated, while other landing parties had managed to join hands. The next three or four days were marked by severe fighting and an advance of the British from the tip of the peninsula. By the afternoon of April 28 some of the troops had pushed up to within 1300 yards of Krithia but could get no farther. The lines then dug in. On May 1, the Turks attacked at night, and there was a counterattack the next day. This is the first so-called battle of Krithia. The second occurred on May 6, and was an attempt to win the Krithia Ridge; this attempt failed but the British advanced their line 500 yards. The third came off on June 4, with the same objective and the same result. The fourth was fought on July 12, and resulted in an advance of 300 yards more or less. Achi Baba still remained in Turkish hands. Meanwhile the Turks were attacking the Anzacs (May 5-10) and were repulsed. They renewed their efforts in great force on May 18, and were again beaten off with great loss. There were other engagements, as that of the French (June 21) who captured a work known as the Haricot Redoubt, and the English action of June 28, known as the battle of the Gully Ravine. And so it went until fresh British forces were landed at Suvla Bay on August 7, and the Anzacs advanced upon the ridges of Sari Bair.

The Suvla Bay landing and simultaneous operations at the tip of the peninsula and by the Anzacs constitute the last great attempt to drive the Turks off the peninsula. In May, Sir Ian Hamilton asked for two additional corps; by the end of July he got them. His plan was now to reinforce the Anzacs and direct them to make a drive and capture Sari Bair. A landing at Suvla Bay would surprise the Turks and might enable the Anzacs after taking Sari Bair to push on to Maidos. The Turks at Krithia and on Achi Baba would thus be cut off. A containing attack was to be made at the tip of the peninsula. This attack was delivered on August 5 and failed. It was renewed on the 7th and resulted in minor local successes; its main purpose of keeping the Turks busy on the spot, and preventing them from lending a hand elsewhere, may be said to

have been realized. The Anzacs, reinforced, attacked on the 6th, and very nearly succeeded in their purpose; but on the 9th an assaulting column lost its way, and arrived too late to clinch the positive gains made on the spur to the southwest of the main elevation (Hill 305) of the Turkish position. During the attack on Sari Bair the landing at Suvla Bay was begun August 6 by night under the direction of Lieut-Gen Sir F. Stopford. It resulted in failure, for although the troops got ashore, once there they accomplished nothing. Apparently there was no well thought out plan of operations, or, if there was, it was not carried out. Some of the troop units were landed in places other than those designated, others were late in moving out. Some local successes were obtained, however, and on the evening of August 7, the British extended in a semicircle around the bay. On the 8th, the British stood fast and made no attempt to advance, and so lost their opportunity not merely to accomplish something on their own account, but to help their comrades farther south engaged in the desperate struggle for Sari Bair. There was more or less fighting during the next week. Open fighting gave way to trench warfare. There was one more battle on August 21, when an unsuccessful attack was made to take Hill 100, about 2 miles east of Suvla Bay.

The struggle for the Dardanelles was now virtually over and it ended in a ghastly failure for the Allies. Sir Ian Hamilton was recalled in October, and the whole peninsula evacuated in December and January, some of the troops going to Saloniki, but most of them going to Egypt to be apportioned among the other fronts. General Hamilton in his *Gallipoli Diary* places the blame almost entirely upon the insufficiency of artillery and inefficiency of the Home authorities in supplying guns, ammunition, spare parts, workshops, etc. The British casualties were 100,000 with about an equal number evacuated because of sickness. The Turkish losses were placed at about the same amount.

1916. Armenian Front. As soon as operations were possible in 1916, the Russians, under General Yudenitch, advanced across the frontier from the Black Sea to Lake Van. Another unit under General Baratoff entered Persia to drive the Turks out of northern Persia. In the middle of February, Erzerum was captured. This was followed by the capture of Bitlis and Mush near Lake Van, and Trebizond on the Black Sea in April. In July, Erzingan, the headquarters for Turkish troops in Armenia, was captured. In the meantime the Russian forces in Persia advanced south as far as Keimanshah, then turned toward the frontier which they reached in May; the objective was Bagdad. The surrender of the British forces at Kut, however, prevented this column from advancing past the frontier. In August the Turks began a counteroffensive which resulted in the recapture of Van and Mush. An advance in Persia forced the Russians back almost to their own frontier. The second half of the year saw little fighting on this front but the Russian forces compelled the retention of a large Turkish force also.

Mesopotamia. As stated above, General Townshend was invested in Kut-el-Amara at the close of 1915. His position was a strong one and the Turks made several futile efforts

to take it by assault and bombardment. Then they determined to starve the British out. In order to accomplish this they constructed defenses on both sides of the Tigris below Kut to prevent a relief expedition from advancing up the river. About the middle of December, General Lake, who relieved General Nixon, began to organize a relief expedition 50 miles south of Kut. This force was organized around the 12th and 7th Indian divisions. This unit was weak numerically and did not have the proper artillery, transportation, or medical supplies.

The relief force, commanded by General Aylmer, set out on January 4, but received a check at Sheik Saad, 25 miles from Kut. Although the attempt to take the positions by force failed, the Turks abandoned the works by January 9. By the 21st, the British had advanced 6 miles further but were compelled to halt before Umm-el-Heuna, which also successfully resisted an attack in force. They held on here until early March, when they were reinforced. An unsuccessful attack was made on the night of March 8-9. On April 5, with the aid of the 13th division which had arrived from Gallipoli, the British captured Umm-el-Heuna. The Turks, however, merely retired to a stronger position at Sannaiyat a mile in the rear. Attempts to take these works between the 8th and 18th failed, and on April 29, General Townshend and his force of 10,000 men, after 143 days of siege, were compelled to surrender because of starvation. After the fall of Kut operations in Mesopotamia came to a standstill. The British made preparations on a larger and much more efficient scale for an advance on Bagdad in 1917. General Lake was relieved of the command in Mesopotamia by General Maude. The failure in Mesopotamia has generally been ascribed to overconfidence, weather (heat and floods), and inadequate transportation and equipment for trench warfare.

Egyptian Front. After the unsuccessful attack on the Suez Canal in 1915, the British, early in 1916, destroyed all the water holes within 30 miles of the canal to prevent further operations against it. They also determined to construct a railroad north to the Katia oasis and to put a pipe line alongside it. In April and August the Turks made efforts to interfere with this construction work but were repulsed. By the end of the year the British had pushed the railway and a complete and modern water-supply system to within 15 miles of El Arish, the most advanced of the Turkish strongly held positions. This activity presaged an attack in Palestine in the near future. During the year the revolt of the Arabs in Hedjaz occurred (see HEDJAZ).

1917. Palestine. The British began an advance on Rafa on the Sinai Peninsula, based on the railway which had been constructed there. This town fell early in February and the British advanced northward toward Gaza and eastward toward Beersheba. They were compelled to spend the summer on the Gaza River after failing to take these places in two attacks. In October they advanced again and by January, 1918, had won a series of brilliant successes. On October 31, Beersheba was taken and on November 6, Gaza fell. By November 15, General Allenby had cut the Jaffa-Jerusalem railway at Ludd and Er Ramle. Two days later Jaffa, the port of Jerusalem, was occupied. The British advanced down the Surar River val-

ley toward the Holy City and up the Damascus-Beersheba railway in order to encircle the city and cut off its supplies, so that it would not come under the bombardment of the artillery. All the towns surrounding the city were gradually taken by storm and as the British closed in it became apparent that the Turks would not risk a siege. The city fell on December 10. There was general rejoicing throughout the world over the return of the city to Christian hands after having been in Turkish hands for almost seven centuries. The Turks west and northwest of the city broke up into small bands and carried on guerilla warfare until the British finally got control of all the high land. General Allenby then pushed across a small stream 4 miles north of Jaffa and captured several small towns which gave him all the high land in the neighborhood, and assured a good defense of the Jaffa-Jerusalem railroad.

The success of the British arms in Palestine effectively put an end to Turkish threats on the Suez Canal and Egypt which had been going on for three years. It also aroused the hopes of the Zionists, who dreamed of reestablishing a Jewish homeland in Palestine. The British government announced in the Balkan Declaration that it looked with favor on the Zionist movement.

Mesopotamia. General Maude, who took command of the Mesopotamian forces in August, 1916, spent the remainder of the year in reorganizing his command and lines of supply. During the same time the Turks had reduced their force at Kut, although they considerably strengthened their positions. When General Maude was ready he began an attack on the Turkish lines east of Kut between the Tigris and the Hai (Dec. 20, 1916). By the middle of January, 1917, the British reached the Tigris up as far as Kut. A month later the Turks evacuated their works on the south bank and were all on the north bank of the Tigris, which owing to floods was 350 yards wide at this point. Under great difficulties the British crossed the river on February 23. The Turks were now in full retreat. On March 11, the British entered Bagdad. This campaign did much to restore the prestige of the British in Mesopotamia and throughout the entire Moslem world. It also compelled the Turkish forces in Persia to retreat. The remainder of the year was spent by the British in making their position secure within a radius of 100 miles of Bagdad.

1918. Collapse of Turkey. Turkey was the second member of the Central Powers alliance to surrender to Allied arms. This was a direct result of a crushing defeat administered by General Allenby. As was narrated above, Jerusalem was captured by General Allenby in December, 1917. Between that time and September, 1918, the British commander was making preparations for his attack on a grand scale. His first object was to secure his right flank by the capture of Jericho and the line of the Jordan. This operation was carried out in February, and was highly successful, the two objectives having been taken shortly after the middle of the month. During March General Allenby was engaged in gaining a line which would enable him to carry out operations east of the Jordan and against the Hedjaz railway, in cooperation with the Arab forces under the Emir Faisal. These were southeast of the

Dead Sea and were under the command of Allenby. Rainy weather and the raising of the level of the Jordan River prevented General Allenby from making any advance across that river. He made several raids which materially hindered the Turkish forces. His further progress was also held up by the difficulties of the Allies in France. He reported that in April the 52d and 74th divisions, 9 yeomanry regiments, 5½ siege batteries, 10 British battalions, and 5 machine gun companies were withdrawn preparatory to embarking for France. In May, 14 more battalions were sent to Europe. During July and August, 10 more British battalions were withdrawn from the fighting in the eastern area. While it is true that most of these units were replaced by Indian forces, nevertheless his actual fighting force was so reduced that he was unable to continue the advance against the Turkish troops until the following September. During the hot summer months the only fighting of any note was an attack delivered by Turkish-German forces on July 14. It gained initial successes by taking Abu Tellul, an important height, and surrounded several other advanced positions. These gains were almost immediately lost again as a result of a brilliant counterattack by Australian forces.

On September 18, the British and the Arabs began an advance in Mesopotamia and Palestine which was ultimately to result in the surrender of Turkey and settle once and for all the Berlin to Bagdad route which had already been broken by the collapse of Bulgaria. Allenby made minute preparations for his blow and completely fooled the Turks as to his intentions. The British, with some French forces in support, struck on a 16-mile front and broke through the Turkish lines between Pafat and the sea and advanced 13 miles. By the 22d, enemy resistance between the Mediterranean and the Jordan River had practically broken down completely and the Allies were forging ahead rapidly. In four days they had advanced approximately 60 miles and had occupied Beisan, Nazareth, and El Afule. Arab forces east of the Jordan destroyed railroads and bridges crossing the stream and thus forced the Turks to retreat in a northerly direction only. Haifa and Acre were seized on the 23d and the Turks east of the Jordan were forced to retreat southerly in the direction of Amman. Three days later saw the British at the Sea of Galilee and the occupation of Tiberias, Semakh, Es-Samra, and Amman. On the 27th the British forces joined with the Arabs east of the Jordan at Mezeris. The advance was now a steady pursuit, without any frontal fighting on the part of the Turks. Damascus fell on the 1st of October, Zahieh and Rayak on the 6th, and Tripoli and Homs on the 16th. In the first three weeks of the campaign more than 80,000 prisoners and 350 guns fell into the hands of the British and Arabs.

The last half of October saw the capture of Aleppo and the complete defeat of the Turkish troops along the Tigris by British forces under General Marshall. This last event was accomplished by the capture of Kaleh Sherghat, which completely cut off communication with Mosul, which, with Aleppo, was the main base of supplies of the Turkish-German forces in Asia Minor.

Facing a supreme disaster, the Turks sued for an armistice. They sent the British gener-

al, Townshend, who had been captured at Kut-el-Amara, to the Allied commander of the Aegean fleet, Vice Admiral Calthorp, to ask for terms. He asked for regularly accredited agents to carry on the negotiations. These were sent to the island of Lemnos, and after a three-day session, terms were handed to the Turks which they accepted on October 30, and which went into effect the next day. A summary of these terms, which practically amounted to unconditional surrender, follows:

The Dardanelles, Bosphorus, and Black Sea were to be opened to the Allies; there was to be immediate demobilization of the Turkish army; surrender of all Turkish warships, and use of mercantile vessels; Allied occupation of any strategical points in Turkey desired by them; immediate withdrawal of Turkish forces from Persia; all Germans and Austrians to get out of Turkey within a month and Turkey to break off all relations with their countries.

COLONIES

Africa. As early as Aug. 7, 1914, the British government telegraphed the South African government to suggest the desirability of seizing such parts of German Southwest Africa "as would give them command of Swakopmund, Luderitzbucht, and the wireless stations there or in the interior," but before operations could be carried on against German territory the local government found itself face to face with a rebellion. See SOUTH AFRICA, UNION OF.

Togoland was taken in a campaign that lasted just three weeks, Aug. 7-28, 1914. Surrounded on three sides by hostile territory, with the sea under British control, it could not hope to offer any resistance.

Kamerun called for a more serious effort on the part of the Allies. Like *Togoland*, it was surrounded on three sides by hostile territory, with the sea under Allied control, but its vastly greater area made operations more difficult and it was more strongly defended. Three expeditions from the northwest were defeated by the Germans in August and September, 1915. Attacking from the sea, however, the Allies took Duala (September 27) and from this point widened their holdings. Two columns pushed their way into the interior along the railways; one of them on October 26 took Edea, repelling six weeks later a counterattack for its recovery. The other column north of Duala captured the entire railway and advanced beyond its head. The French sent down troops from the Tchad, and others, reinforced by Belgians from Equatoria. The result of all these efforts was that German resistance was well worn down, and came to an end with the surrender of Mora Hill early in 1916.

In *German Southwest Africa* the situation was complicated by the South African Rebellion. This rebellion crushed, real operations began in January, 1915, Luderitz Bay having been occupied as early as Sept. 18, 1914. Swakopmund was occupied January 14. The campaign was directed against Windhoek and carried on by two armies; the northern under Botha was to move from Swakopmund, while the southern under Smuts, divided into three columns, was to move east from Luderitz Bay, north from Warmbad, and west from Bechuana-land. By May 1, the end was near. On the 12th, Botha entered Windhoek and the struggle

was practically over; for, pushing on to Grootfontein, now the German capital, he received there the surrender of the enemy forces, on July 9.

German East Africa, the most important colony in Africa, gave the British far more trouble than any of the others. During August, 1914, some successes fell to the British—for example, they demolished, August 13, the port of Dar-es-Salaam—but they decided to remain on the defensive, waiting for troops from India. These arrived November 1, and lay off the German port of Tanga. An attack made on the 4th resulted in a decided reverse for the British, who were compelled to reembark. The Germans now invaded British East Africa, but were pushed back to Jassin in German territory, where on January 18 they defeated the British, and forced a withdrawal of all outlying posts in that region. They had, as early as September, 1914, invaded northeast Rhodesia, where they came into contact with Belgian troops. General Smith-Dorrien, later relieved by General Smuts, was sent out to take command of the troops in British East Africa and the invasion proceeded from that region, as well as from Nyasa on the south.

The British expedition, commanded by General Jan Smuts, won an important victory at the Kitovo Hills, near the northern boundary of German East Africa. After five days of fighting (Mar. 7-12, 1916) the Germans fell back to a position in the forest along the Rufu River. As a result of the operations that followed, the Germans, although reinforced, were compelled to abandon their positions and retire southward along the Tanga railway.

In September, 1917, the Allies began to tighten the ring around the colony. The Belgians, French, British, and Portuguese were invading it from all sides. All of the seaports were in their hands and Tabora, a strong fortress in the north, was captured (September 1-11), by the Belgians. General von Lettow-Vorbeck, the German commander who held out for such a long time against the Allies, finally surrendered on Nov. 14, 1918, three days after the Armistice was signed.

The Pacific. Japan, as Great Britain's ally, declared war on Germany Aug. 23, 1914, but confined her offensive to Germany's possessions in the Pacific. On August 27, she began the blockade of Tsingtao, and by the end of September, two Japanese armies and a few English troops had completed landing, one on the north and the other with the English at Rozan Bay. The German defenses consisted of three lines, the first of fortified hills, the second of 10 forts, and the third of five. By September 28, the first two lines had been carried, and the siege was begun. On October 31 a general attack was opened on the third line which was occupied November 6. The next day the place was surrendered.

For the capture of the other German islands in the Pacific see the section on *Naval Operations*, below.

NAVAL OPERATIONS

Operations in North Sea and Waters About Great Britain. At the end of July, 1914, the German High Seas Fleet was off the coast of Norway and nearly the whole of the British Grand Fleet lay at Spithead off the Isle

of Wight. As the probability of war increased, more and more definite steps were taken to prepare for mobilizing the entire British naval force and putting into commission all ships in reserve and laid up. On August 2, German troops invaded Belgium; on July 29, the British Grand Fleet got under way to proceed to its war base at Scapa Flow. On August 4, Great Britain and France declared war and mobilization of both fleets was directed. Within four hours of the declaration of war, British scouting squadrons were sent towards the German coast, and one submarine flotilla explored the Helgoland Bight.

The German High Seas Fleet, being vastly inferior to the British forces facing it, was hastily withdrawn behind the defenses of the German coast at Kiel and in the Kaiser Wilhelm Canal.

The laying of mines now proceeded with great rapidity. Not only were the German harbors and the vicinity of Helgoland protected but the North Sea was planted with mines where they were most likely to be useful and the passages leading to the Baltic were closed excepting a narrow strip along the coast in Swedish territorial waters, the channels in the mined areas being known only to German and Danish pilots. The separate mine areas were small or narrow but were so numerous as to make navigation dangerous. The British thereupon closed the Strait of Dover by a mined area. They then began a systematic search for German mines, mine layers, and protecting forces, and also despatched their mine-sweeping groups of trawlers as fast as work was found for them. It was in connection with mine planting that the first naval action of the War was brought about. On August 5, H. M. S. *Amphion*, with the third destroyer flotilla, was carrying out a prearranged plan of search when a suspicious ship was reported by a trawler. This was the German mine-layer *Königin Louise*, and she was chased and sunk; but early the next morning the *Amphion* struck a mine and was herself destroyed.

On August 9, protected by the Channel squadron and a special detail of cruisers and destroyers, the first expeditionary force of the British army crossed to France; and thenceforward there was a similarly protected steady stream of transports carrying men, munitions, and supplies.

On August 26, the Eighth Submarine Flotilla, two destroyer flotillas, and their flag cruisers and tenders were ordered to proceed and reconnoitre Helgoland and the waters to the southward. They were followed by the battle cruiser and first light cruiser squadrons. On August 28, the destroyer flotillas, when about 25 miles from Helgoland, and not much farther from Wilhelmshaven, found the enemy in superior force and were compelled to fall back. Admiral Beatty promptly sent the First Light Cruiser Squadron to their assistance, but, as the enemy's force seemed strong, he soon decided to follow with his heavy vessels. The advent of the battle cruisers quickly decided matters. In a short time the German vessels were retiring along the whole front. The light cruisers, *Mainz*, *Köln*, and *Ariadne*, and the destroyer *V-187* were sunk. No British vessels were lost, but the *Arethusa*, flagship of the destroyer fleet, was severely injured and had to be towed to England. The *Queen Mary* was twice at-

tacked and the *Lowestoft* once, by submarines, but the high speed in each case made the attempt abortive. The short range of the torpedoes used in the German submarines was first noticed in these attacks. This action caused the Germans to adopt a purely defensive position.

The month of September was a particularly eventful one. On September 3, the British gunboat *Speedy* was destroyed by a mine and, on September 5, the light cruiser *Pathfinder* was sunk by the German *U-21*, the first surface craft to fall a victim to the dreaded submarine. On September 28, there came an event which startled the world and greatly added to the prestige of the submarine. About daylight that morning, the British armored cruisers *Aboukir*, *Hogue*, and *Cressy* were on patrol duty in the North Sea and steaming at moderate speed in column. At 6.25 A.M., the *Aboukir*, which was leading, was struck by a torpedo from a submarine and began to sink slowly. The *Hogue* and *Cressy* came up to her assistance, stopped and attempted to save life. A little before 7 A.M. a torpedo struck the *Hogue*. She quickly capsized and sank. At 7.15 the *Cressy* was hit by a torpedo and 15 minutes later by another. Some 1460 officers and men lost their lives. All were sunk by the German submarine *U-9*, a 300-ton boat commanded by Kapitän-Leutnant Weddigen. The ease with which he performed his work was due to a lack of a destroyer screen and the folly of the *Hogue* and *Cressy* in stopping their engines in the known presence of submarines. The frightful loss due to this error caused the Admiralty to issue orders forbidding large vessels to proceed to the assistance of others under such circumstances. See section below on *Convoy*, etc., for methods of fighting the submarine.

During the month of October, the Germans lost a destroyer and a submarine; the British, a submarine, an old cruiser, and the dreadnought battleship *Audacious* by a mine. On November 3, Yarmouth and Lowestoft were bombarded. The armored cruiser, *Yorck*, returning from this service, struck a chain of mines entering the Jade estuary and was sunk.

On the 16th the German auxiliary cruiser *Berlin* was interned at Trondheim, on the 20th *U-18* was rammed by a patrol boat and floundered; on the 23d, the German destroyer *S-124* was sunk in a collision with a Danish steamer; and on the 26th, the old British battleship *Bulwark* was blown up in Sheerness harbor, due to some form of interior explosion in which her magazines were involved. On December 16, a German battle cruiser squadron bombarded the cities and harbors of Hartlepool, Whitby, and Scarborough. Nearly 100 noncombatants were killed and 500 wounded. These were not fortified places.

On the morning of Jan. 24, 1915, the fast cruiser fleet in charge of Vice Admiral Sir David Beatty, was patrolling in the North Sea. This fleet consisted of the Fast Battle Cruiser Squadron, *Leon*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable*; the First Light Cruiser Squadron, *Southampton*, *Nottingham*, *Birmingham*, and *Lowestoft*; and two destroyer flotillas. About 7 A.M., the cruiser *Aurora* sighted the German light cruiser *Kolberg* and a destroyer flotilla and at 7.25 action began between them. About this time the German fast squadron (Rear-Admiral Hipper), steering

northwest, was sighted from the destroyer flotillas. This consisted of the battle cruisers *Derfflinger*, *Seydlitz*, and *Moltke* and the large armored cruiser *Blucher*. As soon as the information was signaled to Admiral Beatty, he headed for the enemy, which had changed its course to southeast as soon as it perceived the British battle cruisers. At 8.52, the *Lion* (flagship) opened fire on the *Blucher*, the rear ship of the German column, at a range of a little less than 20,000 yards, but did not get a hit until 9.09. The German vessels began to return the fire at 9.14. The *Blucher* had much less speed than the other German vessels and slowly dropped astern. About 10.48 she fell out of line and turned to the northward with a heavy list. The *Indomitable* was ordered to complete her destruction while the others of the British fleet pushed forward after the main body. At 11.03, the *Lion* received a shell in her engine room which disabled her port engine and she hauled out of action. The *Lion* was towed home by the *Indomitable*. The British squadron was now retiring, having pursued the enemy as close as possible to the areas protected by the mine fields and submarines.

On May 1, 1915, the British destroyer, *Recruit*, was sunk by a submarine and a week later the *Maori*, a much larger boat, was destroyed by a mine off Zeebrugge. On May 27, the British auxiliary cruiser *Princess Irene* was blown up in Sheerness harbor, only one of her crew escaping. Early in July *U-30* was accidentally sunk, but was raised within 48 hours and only one of the crew was found dead.

October 1-4, the Belgian coast was bombarded to assist military operations. On October 28, the armored cruiser *Argyle* ran ashore and was wrecked. On November 4, a German submarine of new type (250 feet long) was captured in a British wire net. On November 17, the hospital ship, *Anglia*, was sunk by a mine in mid-Channel with a loss of 100 lives—chiefly wounded men. On November 28, a German submarine was sunk off the Belgian coast by a bomb from a seaplane. On December 30, the armored cruiser *Natal* was destroyed by an internal explosion while at anchor. On Jan. 9, 1916, the *King Edward VII* was sunk by a mine. This battleship belonged to a class that was one of the last and best of the predreadnoughts.

On May 31, 1916, began the greatest naval battle of the War. About four o'clock in the afternoon the British fast battle squadron of seven battle cruisers and four battleships met the German High Seas Fleet of five battle cruisers and 24 battleships off Jutland on the northwest coast of Denmark. The British engaged the enemy but fell back before the vastly superior force in the direction of their main fleet. In this part of the action they lost the battle cruisers *Queen Mary*, *Invincible*, and *Indefatigable*, and three armored cruisers—all of which were sunk; eight destroyers were sunk during the night attacks. The British Grand Fleet came up about six o'clock, and soon afterward the Germans began to retire, pursued by the British. The action continued until after midnight; the night attacks being those of destroyers and submarines chiefly. The German losses included the battleship *Pommern*, the battle cruiser *Lutzen*, four fast cruisers, and five destroyers. The losses of officers and men were about: British, 5000, Germans, 3500, among

the British were Rear-Admirals Hood and Arbuthnot. The Germans were favored by misty weather, the close proximity of their own coast (which injured vessels could quickly reach), and by the fact that a few minutes after the arrival of the main British fleet, mist and darkness obscured them from the enemy.

On June 5, 1916, the British cruiser *Hampshire* was destroyed by a German mine near the Orkney Islands. Lord Kitchener of Khartum and his staff, on their way to Russia, lost their lives.

In August, Admiral Scheer, commanding the German High Seas Fleet, made a sortie in force. He first sent out 12 submarines which he posted in two lines of six boats each across the expected track of the British Grand Fleet—one 15 or 20 miles north of the Tyne and one about twice as far to the south of it. On August 18, the High Seas Fleet put to sea. Admiral Jellicoe had received ample warning of the probability of such a movement and had instant report of its actual commencement so that he was able to start south with the British Grand Fleet soon after Scheer got his force formed outside the German mine fields. Some hours later, British Submarine *E-23* hit the dreadnought battleship *Westfalen* with two torpedoes which injured her so seriously that she was forced to return to her base under escort. But Scheer pushed on, six Zeppelins scouting ahead. After meeting Beatty's battle cruiser squadron, Jellicoe placed it 30 miles ahead and continued on a southerly course calculated to intercept Scheer before he could reach the British coast. About 6 A.M. on August 19, Beatty's light cruiser screen ran into the first line of U boats, which was moving slowly northward. The light cruiser *Nottingham* was hit by two torpedoes and, while endeavoring to make port, was sunk an hour later by a third torpedo. Jellicoe immediately turned and headed north for a short time while the submarine menace could be gauged and dispositions made to meet it. About 6.30, the Harwich forces (Commodore Tyrwhitt), which were scouting for the German fleet, sighted its light cruisers and upon steaming towards them soon discovered the enemy's battle fleet. About 10.30, Jellicoe turned south again, Beatty and the cruiser screen ahead as before. At 12.30 Beatty's squadron was abreast Newcastle and only 42 miles from the German battleships. Scheer, informed of the situation by his airship scouts, then turned to the south, driving Tyrwhitt's light forces ahead of him. At 2.35 he changed course to the eastward and headed for the entrance to the Helgoland Bight. The Grand Fleet ran into the second line of U boats about 3.20 and soon afterwards Jellicoe, deeming it impossible to overhaul the German fleet until long after dark—and then in the vicinity of the Helgoland submarine base—gave up the chase. He sent Tyrwhitt to take up a position north of Terschelling and make a night attack if practicable. The latter proceeded in obedience to orders but as conditions were unfavorable he returned without attacking. Soon after the Grand Fleet turned north, about 5 P.M. the U boats made another attack and succeeded in sinking the light cruiser *Falmouth*. Scheer's objective was undoubtedly the British Grand Fleet; provided his submarines could sink or disable enough battleships to reduce its strength materially. As they failed to do so he retired. With two or three times as many sub-

marines in three or four lines he might have succeeded if the first one or two lines had allowed Beatty's force to pass over them without attack. A second sortie was planned for October; but the resumption of the qualified submarine warfare against commerce (with warning, visit, and search) left no submarines available for service with the fleet and the project was given up.

On the night of October 26-27, 11 German destroyers made a very successful raid in the Channel, destroyed the transport *Queen* (no troops on board) and seven drifters, disabled one other destroyer and, although chased and fired upon, escaped into Zeebrugge.

On November 5, British submarine *J-1* discovered a division of German battleships endeavoring to refloat two stranded U boats. She torpedoed and seriously injured the battleships *Grosser Kurfurst* and *Kronprinz* but they were able to get back to port.

About November 25 the German raider *Moewe* made her way through the blockade and was followed on the 30th by the *Wolf*. On Jan. 9, 1917, unrestricted warfare against commerce (see BLOCKADE, SUBMARINE) was ordered to begin on February 1, but this was not publicly announced until January 31. In February, German destroyers made a raid in the Channel but effected no damage. On March 17, a more successful raid took place. One British destroyer and a merchant vessel were sunk and another destroyer disabled. On the same day the raider *Leopard* attempted to pass through the blockade but was intercepted and sunk. About this time the *Moewe* slipped back through the blockade after capturing 27 ships, one of which she sent into Swinemunde.

On the night of April 20 occurred the sharpest fight of the War in which only destroyers and flotilla leaders were engaged. About 12.45 A.M., the flotilla leaders *Broke* (Comdr. E. R. G. Evans) and *Swift* (Comdr. A. Peck), constituting the West Barrage patrol, sighted German destroyers on the port bow 600 yards away. These boats, six in number, were of the latest and largest German type and were on their way back from the Dover coast where they had fired a few shots but effected no damage. The *Swift* tried to ram the leader but failed and passed through the German line, firing a torpedo at one of the rear boats; then, turning, she again attempted to ram the leader which once more eluded her and fled with the *Swift* in pursuit. The *Broke* hit the second German boat with her torpedo and opened a furious fire from every gun that would bear. At the same time she turned to port and rammed the third German, her stern remaining in the hole it made. While thus locked together, the crews fought hand to hand as in old sailing-ship days. Of the Germans who attempted to board, two were captured, several killed and the rest driven back. The *Broke* then succeeded in extricating herself and attempted to ram one of the other Germans; while she failed in this she hit the German's consort with a torpedo. They both started away and the *Broke* attempted to follow but a shell partly disabled her engines, so she gave up the chase and, turning her attention to a disabled German, which was on fire, silenced her guns and sank her with a torpedo. The *Swift*, returning, completed the destruction of the boat the *Broke* had rammed. The British lost 22 killed, the bodies of 28 Ger-

mans were recovered; 10 German officers and 108 men were saved and made prisoners.

On May 4, the first division (six boats) of American destroyers joined the British fleet and they were followed within 30 days by three other divisions of the same size. By midsummer the numbers had grown to 35 while dozens more were nearly completed and were despatched as soon as they were finished, commissioned, and supplied. This great addition to the destroyer fleet made a real convoy system possible, but it was not until a year later that the production of destroyers had so much more than caught up with the U boat building as to make commerce and the transportation of troops sufficiently safe to insure German defeat.

During the summer of 1917 the British monitors bombarded the German submarine and destroyer bases at Zeebrugge and Ostend but effected no important results. On July 9 the British dreadnought battleship *Vanguard* was utterly destroyed by an internal explosion while at anchor in Scapa Flow. Ten (and probably eleven) Allied warships were lost in this way during the War. Eight, if not all of them, were using some form of nitroglycerin gunpowder. The Americans, French, and Germans—who used nitrocellulose powders—had no such experiences.

On October 17, at early dawn, the weekly convoy between Lerwick, Scotland, and the Norwegian coast was attacked by two German light cruisers. There were two British and nine neutral vessels convoyed by the destroyers *Strongbow* and *Mary Rose*. The destroyers were sunk in a very few minutes, and only two or three of the merchant vessels escaped. Considering the fact that this convoy made a regular weekly sailing each way, the conveying force was inexcusably weak.

On November 2, a German decoy cruiser lying in wait for British submarines was sunk by a destroyer flotilla and on November 17 an indecisive action occurred off Helgoland. The British had been laying mines in large numbers across the German exit channels through their own mine fields and the enemy's mine sweepers were kept busy in maintaining a clear channel. An attack on the light cruisers scouting ahead of the mine sweepers was made by a British force consisting of the light cruisers *Courageous* and *Glorious*, several other light cruisers, the battle cruisers *Renown* and *Repulse*, and a number of destroyers. But the German battleships *Kaiser* and *Kaiserin* coming up, followed by the battle cruisers *Moltke* and *Hindenburg*, the British retired.

This was followed, on December 12, by a second attack on the Norwegian flotilla (six vessels) convoyed by the destroyers *Pellaw* and *Partridge* and four trawlers. The German force consisted of five or six destroyers. The four trawlers were quickly sunk. The *Partridge* was disabled, captured, and sunk. Her officers and men were made prisoners. The *Pellaw*, though chased by three of the enemy, escaped in a rain squall. This second catastrophe led to a change in the Norwegian convoy which had its escort greatly strengthened.

On Feb. 15, 1918, the Second German Destroyer Division made a raid into the Channel from Helgoland Bight, sinking seven drifters and one trawler and injuring three drifters and one mine sweeper. They were not discovered by the patrol until too late and they escaped home-

ward without injury. In another raid from Dunkirk on March 21, the German destroyers were not so lucky. Instead of trawlers and drifters, they met the flotilla leader *Botha* (1700 tons) and the destroyer *Morris* (1000 tons). The *Botha* rammed a German at full speed and cut it in two. A second German was disabled by the fire of the British boats. Shortly afterward the *Botha* was hit by a torpedo that disabled her engines. The *Morris* chased the other German boats into Ostend. On her return she sank the disabled German and took the *Botha* in tow.

On the night of April 22-23 occurred one of the most daring feats of the War. This was an attempt by the British navy to close the inner channels of Zeebrugge and Ostend by sinking in them old cruisers whose holds were half filled with concrete. The force consisted of the old 5750-ton cruiser *Vindictive* carrying a landing party of several hundred sailors and marines; the ex-ferry steamers *Iris* and *Daffodil* carrying some hundreds more, the old 3400-ton cruisers *Thetis*, *Intrepid*, and *Iphigenia*, with holds half filled with concrete; several patrol boats fitted to make a heavy smoke screen; many motor boats and launches for scouting, laying navigation lights, carrying off survivors, etc.; lastly, three destroyers, one carrying Admiral Keyes, commander-in-chief of the district. The destroyers were not expected to join in the blocking operations or in the attack but were designed to keep off German destroyers and to sink any trying to escape. Just at midnight the Zeebrugge breakwater was sighted 400 yards away and the cruisers and ferryboats started in at full speed followed by the small craft. A moment later they were discovered by the enemy who opened on them with heavy and machine guns on the shore and breakwater. In five minutes the *Vindictive* had her bow secured to the breakwater but had to have the *Daffodil* force her stern in on account of the sweep of the tide. The gangplanks—18 in number—were promptly placed but the rolling of the ship made them difficult to use, the men having to jump, drop, or get ashore as best they could, carrying their rifles, machine guns, bombs, etc. Meanwhile the enemy's fire was terrific. The naval captain commanding the bluejackets of the landing party and the colonel commanding the marines were killed before they could get ashore, as were many of their officers and scores of their men. The commander, executive officer, and senior lieutenant of the *Iris* were killed and the officer next in rank was wounded. A shell, exploding between decks among the 56 marines waiting there to go ashore, killed 49 and wounded the other seven. Altogether the *Iris* lost eight officers and 69 men killed and three officers and 102 men wounded. The guns of the *Vindictive* swept the mole and behind their barrage the landing party advanced, driving the Germans before them or into the water. After 15 minutes of desperate fighting the breakwater was cleared, its guns silenced, and the long row of hangars and storehouses set blazing or blown up. An old submarine loaded with explosives was now driven under the viaduct leading to the shore, abandoned and blown up, the Germans who were still firing from the viaduct going up with it. The way was now clear for the concrete ships and 10 minutes later they rounded the end of the mole and drove straight for their objective under fire that was

still heavy. The leading ship fouled the wire nets in the channel so she had to be sunk too far out to be of much use, but she cleared the way for the others which were sunk in the narrowest part of the channel, one heading east and one west. It was still possible to work small submarines and torpedo boats around the sunken hulls, but destroyers and large craft were barred. Notwithstanding the heavy fire directed at them practically all of the officers and crews of the concrete ships escaped and were picked up by small craft. The *Vindictive* and her consorts then gathered up their wounded and un wounded and put to sea. Two less well-planned attacks on Ostend failed to secure results of importance.

On Apr. 23, 1918, the German High Seas Fleet made its last sortie. This was directed against the Norwegian convoys which had grown greatly in size and now consisted of 25 to 50 merchantmen with a strong convoying force. The Germans arrived off the Norwegian coast a day too soon to catch the westbound ships and two days too soon to catch those bound to the eastward. The *Moltke* had lost one propeller on the way north and, while being towed back by a battleship, though supposedly covered by the returning fleet, she was torpedoed by a British submarine and seriously injured.

Work on the great northern mine barrage (see MINE, SUBMARINE) began early in the year, but shortage of mines, mine-layers, and men delayed a serious prosecution of the work until the arrival of the American mining squadron in May, with many large mine-layers and vast supplies of mines, permitted the operations to be carried on rapidly.

United States Transport Service. As, at the outbreak of the War, very few American troops were ready for foreign service, the lack of adequate means for the transport of large numbers of officers, men, and supplies was not felt; and the facilities grew faster than the demand for them until May, 1918, when the great rush of troops to stem the German advance strained the capacity of transport to the utmost. The first troops were sent in July, 1917, and the convoy consisted of a few cruisers and transports. The Cruiser and Transport Service was then organized and placed under the command of Rear-Adm Albert Gleaves who rapidly developed it into the most wonderful thing of its kind the world has ever seen. So successful was the convoy system that after its establishment not a single American transport was torpedoed on her eastward voyage when she was carrying troops. On the return trip, with only the crews and a few others on board, three transports were sunk by submarines and one badly injured but able to reach port, total loss of life on the four ships being 138. On the return voyage it was not always practicable to give the same protection as on the eastward trip. The total army personnel carried was 2,075,834, of whom about 83,000 were doctors, nurses, hospital attendants, mechanics, and civilians employed in auxiliary services. In addition, 5,150,000 tons of cargo were delivered in France and England—artillery, ammunition, aircraft, food, clothing and other necessary military supplies. In July, 1918, 306,500 officers and men were brought over and for the other months of the year from May to October the figures were almost equally large. About half the vessels used were American and half Brit-

ish, but four French men-of-war assisted and several neutral vessels were chartered, principally for carrying supplies.

The German Surrender. The terms of the Armistice required Germany to immediately surrender to the Allies 10 battleships, 6 battle cruisers, 6 light cruisers, 2 light mine-laying cruisers, 50 destroyers of the latest types, and all submarines; all except the destroyers and submarines were designated by name. On November 21, the following vessels surrendered to Sir David Beatty, the British commander-in-chief. 9 dreadnought battleships (*Friedrich*

Naval Vessels of All Combatants Lost or Destroyed. The accompanying table gives the numbers of the most important vessels (arranged in classes) lost by each of the belligerent navies from Aug. 1, 1914, to Nov. 11, 1918, not including any vessels surrendered by the Armistice or by peace treaties. The abbreviations used signify as follows: D B., dreadnought battleship; P B., predreadnought battleship; B. C., battle cruiser; A C., armored cruiser; L. C., light cruiser or protected cruiser; D., destroyer, S., submarine. Numbers marked with an asterisk (*) are approximate.

Nation	D B	P B	B. C.	A C	L. C.	D	S.
United States	2	11	3	13	16	64	54
Great Britain	4	2	5	2	9	13	7
France	1	2	2	1	3	2	15 *
Italy	1	2	2	1	3	2	208 *
Japan	2	2	1	2	17	6	11 *
Russia (to 1-1-'18)	1	1	6	3	6	3	
Germany	2	1	1	6	17	6	11 *
Austria	2	1	1	6	17	6	11 *
Turkey	2	1	1	6	17	6	11 *

der Grosse, König Albert, Kaiser, Prince Regent Luitpold, Kaiserin, Bayern, Markgraf, Kronprinz, and Grosser Kurfürst); 5 battle cruisers (*Seydlitz, Moltke, Derfflinger, Hindenburg, and Von der Tann*); 5 light cruisers (*Karlsruhe, Frankfurt, Emden, Nürnberg, Coln*); 2 light mine-laying cruisers (*Brummer and Bremse*), and 49 destroyers. To make up the deficiencies, the dreadnought battleship *König*, the light cruiser *Dresden*, and one destroyer were surrendered on December 4, and on Jan. 10, 1919, the dreadnought battleship *Baden* was sent in place of the battle cruiser *Mackensen* which was not ready for sea. The total number of submarines to be surrendered was 158; of these, 87 reported to Rear-Adm. Sir Reginald Tyrwhitt off the Suffolk coast in November, by Jan. 1, 1919, 114 were received.

With the exception of the submarines, all the vessels named or enumerated in the foregoing list were interned in Scapa Flow. The Treaty of Versailles provided that the interned ships be permanently given up to the Allies; that within two months the 8 dreadnought battleships still in Germany should be given up, also 8 light cruisers, 42 modern destroyers, and 50 modern torpedo boats. It further provided that the German navy was thereafter not to possess more than 6 battleships of a predreadnought type, 6 light cruisers, 12 destroyers, 12 torpedo boats, and was to have no submarines. All vessels under construction and not permitted by the foregoing limitations were to be broken up. No vessels were to be built except to replace allowed units of the fleet—battleships after 20 years, cruisers and destroyers after 15 years. The personnel, including reserves for the fleet and coast defenses, was not to exceed 15,000 officers and men. As soon as the decision of the Versailles Treaty was understood by the Germans to be irrevocable, and one week before it was signed, at 11 15 A.M., June 21, 1919, upon signal from the *Emden*, the German captains at Scapa scuttled their ships. Only four were salvaged, the *Baden, Emden, Frankfurt*, and *Nürnberg*. As partial indemnity for this act of treachery, Germany was compelled to deliver to the Allies 300,000 tons of floating docks, her remaining light cruisers (*Graudenz, Königsberg, Pillau, Regensburg, and Strassburg*), and 42,000 tons of floating cranes, dredges, and tugs.

The merchant ships of the Allies and neutrals sunk by submarines during the course of the war totaled 4837, divided by years as follows: 1914, 3; 1915, 306; 1916, 964; 1917, 2430; 1918, 1035. During the same period surface craft sank 177 merchantmen, and mines accounted for 497 vessels. The total tonnage of the ships sunk by submarines, surface craft and mines amounted to 12,739,000. The peak year was 1917, when more than 6,000,000 tons were sunk. According to British Admiralty reports, 189 enemy submarines were sunk.

Convoy and Other Antisubmarine Defense Measures. The principle of protecting noncombatant vessels by means of accompanying warships is as old as recorded history and has been used to some extent in almost every naval war. In the World War, for various reasons, its adoption was delayed—except for cross-Channel transport—until the submarine sinkings reached a point that demanded the better use of every method to reduce the destruction. The system of patrolled routes in which cruisers, destroyers, and patrol vessels moved back and forth along the lines of traffic was found to be wholly ineffective. General convoy was opposed by the British Admiralty, the officers of the Grand Fleet, and owners and captains of merchant vessels. Suitable escort vessels were inadequate in number, and so many destroyers—by far the most efficient escort craft—were needed for naval operations that few were left for other purposes, but the urgency of the situation forced the naval authorities to detach as many of them from the fleet as could possibly be spared. The owners of fast merchant vessels agreed, after considerable grumbling, to the delays made necessary by convoy, and the dissenting captains were forced to accept the convoy system, which entailed much additional care in steering, speedkeeping, etc. The available British destroyers were reinforced in May, 1917, by 24 from the United States Navy. Additional ones were constantly arriving from the United States and new British boats were being completed so that, notwithstanding the withdrawal of many United States boats to protect American troopships, the number available for general British convoy increased from 29 in January, 1917, to 139 in November, and continued to grow. After the system got in full working order in the summer of 1917, the amount of ton-

nage sunk each month, with some slight fluctuations, decreased steadily to the end of the War.

In most convoys the train (i.e. the vessels being convoyed) consisted of 12 to 40 ships—preferably 25 to 35—arranged in three or more columns. The distance between ships in each column was usually 500 yards and the interval between columns 800 yards, but these figures were sometimes increased in bad weather or under special circumstances. The escort of the earlier convoys consisted of two destroyers, a wholly inadequate force which offered no protection against the weakest of German cruisers or destroyer divisions (usually five boats) and very little against submarines. Cruisers, acting as a covering force for the convoy, were always on patrol in its vicinity, but they frequently failed to arrive until after the escorting destroyers had been sunk or driven off and a heavy toll taken of the ships convoyed. Later convoys had an escort of 6 to 12 destroyers distributed ahead, on each beam, and astern. British convoys were assembled in certain ports and placed in charge of a naval officer, called "commodore of convoy," who took passage in one of the ships with his staff and returned in the escort when the convoy broke up 200 to 400 miles off shore. He received reports of danger and directed the course, speed, and steering. The American troopship convoys were usually accompanied by a regular naval cruiser, the captain of which acted as commodore of convoy. As the captains of most of the troopships were officers of the navy or of the naval reserve, a high degree of convoy efficiency was obtained and this was an important factor in the wonderful success of the work. The "zig-zag" method of steering used when in submarine-infested waters, or when a submarine was sighted, consisted in an irregular and frequent change of course of one to two points on either side of the regular course. This seriously interfered with a submarine's calculations and compelled it to get very close to the target (and therefore within easy sight and range of the destroyers) in order to have any reasonable probability of scoring a hit. Another means of deceiving the submarine as to the course steered by a vessel was camouflage painting, which also added much to the difficulty of sighting a ship and identifying her character; for these reasons it was very generally adopted by both war vessels and merchant ships. A camouflaged ship resembled a huge futurist painting of nothing in particular, the stripes, areas, colors, and lines so breaking up the picture as to render it almost impossible to make out the actual contours of the hull and upperworks except at close range or under exceptional conditions of light and background. Smoke screens, much used by destroyers in naval actions, were occasionally employed by merchant vessels, especially when not under convoy. They were produced by special handling of the fires under oil-burning boilers or by chemicals.

Operations in the Baltic. As soon as the relations with Russia became strained, German ships began to patrol the coast from Memel to the Gulf of Riga. Mine laying by Germany and Russia began in the Baltic at least as early as in the North Sea. On August 27, the German cruiser *Magdeburg* ran ashore in a fog on the Island of Odensholm and was blown up to avoid capture by an approaching Russian naval force.

On December 12, the German armored cruiser *Friedrich Karl* was sunk by a mine and on the 25th the old cruiser *Hertha* and a mine layer were attacked by Russian cruisers and sunk. The Russian submarines were now becoming effective and, notwithstanding the ice, were cruising in the Baltic, although the ice interfered with prosecuting operations of importance during the remainder of the winter and in the early spring.

On July 2, 1915, a Russian cruiser squadron drove off a German light cruiser and several destroyers and forced the mine layer *Albatross* to run ashore in a sinking condition. British submarines had now reached the Baltic in considerable numbers, passing under the mine fields or through the Sound and along the Swedish coast. Their presence acted as a strong check on German operations, especially after the German armored cruiser *Prinz Adalbert* was sunk (October 23) off Libau. On November 7, a British submarine sank the German cruiser *Undine*, and on December 19, another submarine sank the *Bremen* and a torpedo boat.

No operations of importance occurred during 1916 and early in 1917 the Russian Revolution left the control of the Baltic entirely in the hands of the Germans.

Operations in the Mediterranean. On the day after war was declared, the German naval force in the Mediterranean bombarded undefended seaport towns in Algeria, the battle cruiser *Goeben* firing upon Philippeville and the light cruiser *Breslau* upon Bona. These cruisers arrived in the Dardanelles on August 10. To avoid immediate trouble for the Ottoman authorities they were supposedly sold to Turkey and renamed *Sultan Selim Sarus* and *Medilli*, but they continued in command of German officers and retained a part at least of their German crews.

On August 9, Austria declared a blockade of the Montenegrin coast and bombarded Antivari. About the same date French and British fleets established a blockade of the Austrian coast at the Strait of Otranto. The Austrians had placed mine fields all along their coast. About the middle of August, Allied forces swept up the Adriatic, driving the Austrians to the northward. They then attempted to take Cattaro for a naval base, but lacked the military force for a garrison and shore operations, and therefore failed.

The peculiar behavior of Turkey and the mining of the Dardanelles caused a British force to be maintained in that region. While on this duty the armored cruiser *Warrior* ran ashore and was injured on September 7. On the 10th, Turkey abrogated the capitulations with foreign governments and during the latter part of October permitted her vessels to sink Russian ships of war and to attack Odessa. De facto war was begun by the Entente Allies on November 1. On November 21, the French submarine *Curie* was sunk while scouting along the Austrian coast. On November 24, Italy landed a force at Avlona to assist her protégé Essad Pasha against the Albanian insurrectionists.

On February 24, 1915, the French destroyer *Dague* was sunk by a mine off Antivari. On April 26, the French armored cruiser *Léon Gambetta* was torpedoed by the Austrian submarine U-5 and sank in 10 minutes.

On May 24, Italy declared war on Austria; on the same day Austrian torpedo boats, sup-

ported by the light cruiser *Novara*, made a raid on the Italian coast, where they were first met by Italian destroyers and finally driven off by Italian cruisers. The Italian destroyer *Turbine* was sunk early in the action. On June 10, the Italians captured Monfalcone with its ship-building yards. The advent of Italy into the War completed the control of the Adriatic by the Entente Allies and, on July 6, Italy clinched the situation by a proclamation closing it to all merchant vessels not possessing special permits. Operations of the Austrian submarines were much hampered by the destruction of their base on Lagosta Island by the French destroyer *Bisson*.

On September 28, a fire broke out on the Italian battleship *Benedetto Brin* while she was lying at anchor in Brindisi harbor. The fire was quickly followed by an explosion which destroyed the ship.

During the month of December, 1915, the Italians landed a large force of troops in Albania. The expedition was most efficiently guarded against submarines and the only losses were the destroyer *Intrepido* and the troopship *Ré Umberto*, which struck drifting mines. In January, 1916, a cruiser of the *Novara* type was sunk by the French submarine *Foucault*.

The Italian dreadnought, *Leonardo da Vinci*, blew up in the harbor of Taranto on August 2. The British transport, *Francona*, was torpedoed on October 5, and on October 9, the French auxiliary cruiser, *Gallia*, was similarly sunk. The British ship *Britannic* was sunk by a mine in the Aegean Sea on November 21. On December 11, the Italian battleship, *Regina Margherita*, struck a mine and sank and 675 lives were lost.

The naval operations in the Adriatic during the year 1918 were very active. On Dec. 9, 1917, Italian torpedo boats made a raid on Trieste, and sank the small battleship *Wien* (5500 tons), and injured another of the same class. On April 22, in a fight between two British and five Austrian destroyers, the former were reinforced, and the latter retreated to Durazzo, with the British in pursuit. On June 10, 1918, the Austrian battle fleet of four dreadnought battleships, accompanied by cruisers and destroyers, while on its way to make a demonstration in force against the Otranto barrage, was attacked by two small Italian torpedo boats which sank the battleship *Szent Istvan* and seriously injured the *Prinz Eugen*, a sister ship.

Operations in the Black Sea and Dardanelles. The first operations took place on October 29, when the Turkish squadron, including the *Sultan Selim Javuz* (ex-Goeben) and *Medillu* (ex-Breslau) bombarded several Russian ports. A destroyer entered Odessa harbor, torpedoed and sank the gunboat *Donetz* and badly injured the *Kubanez* (a sister to the *Donetz*), and four merchant steamers. On the same day the *Medillu* bombarded Theodosia, seriously injuring the cathedral and other buildings. On their way to Sebastopol the Turkish destroyers sank the Russian mine layer *Pruth*. The next day (October 30), accompanied by destroyers, the *Sultan Selim* bombarded Sebastopol. By the return fire of the forts she was so badly injured that the admiral collected the squadron and returned to Constantinople.

During January, 1915, the Russian fleet sank

several Turkish vessels in the Black Sea, including a number of troopships and transports, and shelled the Turkish naval station at Sinope. On the 17th the French submarine *Saphir* was sunk by a mine in the Dardanelles. About the middle of February, the combined British and French fleets began their fruitless attempt to force a passage of the Dardanelles. No operations in the whole course of the War were so poorly conceived and so inefficiently carried out. It is hard to understand the folly of the British government in embarking upon such an expedition. If there is one thing that is well understood in naval war it is the absurdity of attacking strong forts by ships, especially without adequate military support. Even if the ships can drive out the garrison it will return as soon as the bombardment ceases. Unless the fortifications are badly placed, they cannot be wholly destroyed and the ravages of bombardment can be largely restored by a few days' work. Permanence of victory can only be obtained by occupying the works as soon as the defenders are expelled (see MILITARY OPERATIONS).

As already stated, the operations began in February. Several bombardments of the forts were carried out and considerable injury inflicted upon them. The ships, much hampered by bad weather outside, then entered the straits for closer work. On March 18, the British battleships *Ocean* and *Irresistible* and the French battleship *Bouvet* were sunk by mines and the British battle cruiser *Inflectible* badly injured by gun fire. The plan of forcing the passage by battleships was then given up, and the second phase of the operations soon began. Late in April the British and French troops were landed under fire at the Dardanelles. On May 12, the British battleship, *Goliath* was sunk by a Turkish destroyer in a night attack; the battleships *Triumph* and *Majestic* were sunk by submarines a few days later, the former on the 25th, the latter on the 27th. The British submarines were very active at this time in the Black Sea and Sea of Marmora, sinking many vessels, chiefly transports and troopships, but on August 8 they sank the old Turkish battleship *Kheyr-ed-din Barbarossa* and the Turkish gunboat *Berk-i-Satvet*. In June, the German *U-51* was sunk in the Black Sea and the German submarine base at Smyrna destroyed.

About August 1, the French submarine *Mariotte* was sunk. During the summer many British transports and troopships were destroyed by German submarines, the most important being the troopship *Royal Eduard*, which was sent to the bottom on August 14 with the loss of 800 lives; but the sinking of the troopships *Ramazan* (British) and the *Marquette* (French) were disasters almost equally great. In the Black Sea the Russians seemed to have been unable to blockade or capture the *Medillu* (ex-Breslau) or the *Hamidieh*. In October, the *Sultan Selim Javuz* (ex-Goeben) appeared again in the Black Sea but accomplished nothing of importance and seemed to be partly disabled.

The Dardanelles operations were now admitted to be a failure, and the British began to transfer their troops to Saloniki. The operations in the Black Sea still continued but by the summer of 1916 had become of no special importance, since the Turkish navy had for a time been reduced to impotence. On Oct. 20,

1916, the *Imperatritsa Marie*, a Russian dread-nought, blew up.

At the outbreak of the Bolshevik revolution, many of the officers and men of the Black Sea fleet refused to recognize the authority of the Bolshevik leaders, Lenin and Trotsky. This resulted in several battles between the two factions which usually ended disastrously for the anti-Bolshevik group. The ships were surrendered to the Germans on June 10, 1918. The Turkish cruiser *Medjuhieh*, which had been sunk in action, and afterwards raised and repaired by the Russians, was returned to the Turks.

Cruiser Operations in Atlantic, Pacific, and Indian Oceans. At the outbreak of war the only German vessels beyond the reach of home ports were the battle cruiser *Goeben*, the armored cruisers *Scharnhorst* and *Gneisenau*, the fast cruisers *Karlsruhe*, *Breslau*, *Emden*, *Dresden*, *Nurnberg*, *Konigsberg*, *Leipzig*, and *Breslau*, and a number of small cruisers and gunboats. To these were quickly added several fast merchant steamers, the *Kaiser Wilhelm der Grosse*, *Kronprinz Wilhelm*, *Prinz Eitel Friedrich*, *Cap Trafalgar*, and *Spreewald*. These had their armaments on board or in German colonial ports.

The operations of the *Goeben* and *Breslau* are described elsewhere in this article. The *Scharnhorst* and *Gneisenau* were, after the *Goeben*, the most important vessels on the list and were under the command of Vice Admiral Count von Spee, the only German flag officer outside of European waters. After the commencement of hostilities these vessels were first heard of at Tahiti, where they bombarded the port of Papeete and sunk the French gunboat *Zélée*. The *Nurnberg*, after cutting the America-Australia cable at Fanning Island, joined Von Spee's squadron. He then proceeded to the west coast of South America, where he met the *Dresden* and *Leipzig*. On the afternoon of Nov. 1, 1914, Rear-Adm. Sir Christopher Cradock, with a squadron consisting of the armored cruisers *Good Hope* and *Monmouth*, the fast light cruiser *Glasgow*, and the armed merchant steamer *Otranto*, was off the Chilean coast searching for German cruisers. The old battleship *Canopus* was near at hand and proceeding to a rendezvous to join the squadron. About 4:20 P.M. smoke was seen to the northward and soon afterward Von Spee's squadron, consisting of the *Scharnhorst*, *Gneisenau*, unarmored cruisers *Dresden*, *Leipzig*, and *Nurnberg*, was sighted heading south. At 7:03, the enemy opened fire at about 11,500 yards, quickly followed by the British. The superiority of the German ships was at once apparent. At 7:50 a tremendous explosion occurred on the *Good Hope* amidstships, the flames reaching an altitude of 200 feet. The *Monmouth* was already out of action, down by the head, and leaking badly. Darkness and a rain squall coming up made the pointing of the guns very difficult, so Von Spee signaled the light cruisers to attack the enemy's ships with torpedoes. The *Good Hope* could not be found and had probably gone down, but the *Nurnberg* discovered the *Monmouth* and, by gun fire at close range, caused her to capsiz. In the darkness and thick weather the *Glasgow* and *Otranto* got away without difficulty.

The British Admiralty immediately took steps to meet the situation by secretly despatching a squadron under Vice Admiral Sturdee in

pursuit of Von Spee. This consisted of the battle cruisers *Invincible* and *Inflexible*, the armored cruisers *Carnarvon*, *Cornwall*, and *Kent*, the fast cruiser *Bristol*, and the *Macedonia*, supply steamer. At some rendezvous on the South American coast they were joined by the *Canopus* and *Glasgow*. About 8 o'clock on the morning of December 8, while Sturdee was coaling in the Falkland Islands, the leading ships of the German squadron were sighted. Knowing nothing of the battle cruisers, the Germans came leisurely on, apparently intent on destroying the wireless station. At 9:20, they were within 11,000 yards, and the *Canopus*, still at anchor, opened fire on them over the lowland. They then turned to the southeast to rejoin the main body which immediately proceeded to the eastward at full speed. At 9:45, the British squadron came out and started in chase. About 1 P.M. the *Invincible* and the *Inflexible* began firing on the rear ships of the German column and a little later were able to reach the armored vessels and leave the others to the cruisers. At 4:04, the *Scharnhorst* began to list heavily to port and at 4:17, sank with all hands. The *Gneisenau* continued the hopeless fight, though after 5 o'clock she was hors de combat. At 6 P.M., she heeled very suddenly and sank. Of the German light cruisers, the *Leipzig* was sunk by the fire of the *Glasgow* and *Cornwall* about 9 P.M., and the *Nurnberg* by that of the *Kent* at 7:27. The *Dresden*, which escaped, was discovered off the island of Juan Fernandez on Mar. 14, 1915, by the *Glasgow*, *Kent*, and auxiliary cruiser *Orama*. After an action of five minutes' duration she surrendered, but was on fire and soon afterward blew up.

Of all the German cruisers the *Emden* had the most spectacular and successful career. On August 1, she left Tsingtao. During her remarkable career of 94 days, the *Emden* captured or sank 30 vessels, destroyed \$25,000,000 worth of the enemy property, almost paralyzed the commerce of the East, and had 19 war vessels of the enemy seeking her. She was finally compelled to run ashore on the Cocos Island by the *Sydney* on November 9.

The *Konigsberg* was less successful. After a cruise of two months along the South African coast, in which she destroyed several British merchant ships and the small cruiser *Pegasus*, she was blockaded in the Rufiji River, German East Africa, where she was destroyed by a British expedition on July 11, 1915.

Of the German armed merchant steamers, the *Spreewald* was captured by the armored cruiser *Berwick* on September 12. The *Kaiser Wilhelm der Grosse* had a still shorter career, being sunk on Aug. 27, 1914, by the British cruiser *Highflyer*. On October 14, the *Cap Trafalgar*, which was beginning to interfere with the British trade to South America, was sunk by the British armed steamer *Carmama*, late of the Cunard line. The *Kronprinz Wilhelm* and the *Prinz Eitel Friedrich*, after long and successful cruises as commerce destroyers, entered United States waters and were interned at Norfolk.

Immediately after war was declared, the Entente Allies began perfecting arrangements for the capture of German colonies. On August 7, Togoland was seized by land forces. On August 27, Japan declared a blockade of Kiaochow, and on November 7, Tsingtao, the German stronghold in China, surrendered to the Allied

forces, chiefly Japanese. Early in August, a New Zealand expedition sailed for Samoa. At Noumea, the convoy, which was a weak one, became strengthened by the battle cruiser *Australia* and the cruiser *Melbourne* of the Australian navy, and the French armored cruiser *Montcalm*. The expedition arrived at Apia on August 29 and the German governor surrendered at once, as he had practically no means of resistance. On its return from Samoa, the Australian squadron captured Herbertshohe, the capital of the Bismarck Archipelago, and, on September 27, took possession of the town of Friedrich Wilhelm in Kaiser Wilhelmsland (German New Guinea). During September and October, Australian and Japanese expeditions seized the remaining German possessions in the Ladrones, Marshall, and Caroline Islands.

AÉRIAL OPERATIONS

The outbreak of the War found the Great Powers of Europe ready and anxious to make immediate application of aeronautics to their respective military and naval operations. That all were inadequately prepared on the score of equipment and trained personnel the opening weeks of the war soon showed, and early the demands likely to be made on the aerial services were clearly indicated. But in no field did developments follow more rapidly, and as early as the Germans undertook the invasion of Belgium and France it was realized that aeroplane and airship had worked materially to change the nature and scope of military operations and to render obsolete tactics and movements that long had prevailed in warfare. By affording to scouts and intelligence officers a complete view of the enemy's territory, the disposition and movement of his troops and fleets, and his permanent or even most temporary defenses, surprise or flanking movements were rendered practically impossible. With both sides adequately informed as to the forces of their adversaries through constant aerial scouting and reconnaissance, the tendency towards trench fighting and the protracted sieges and bombardments of the Western front was as pronounced as it was inevitable. The direction and control of fire from an observation or kite balloon or aeroplane early became an indispensable feature of the work of the artillery. The tactical changes wrought by the use of aircraft were stupendous, and the service of security and information by aerial observers and range finding for the artillery became essential features of the everyday work of the forces in the field. In addition there were raids by aeroplane and airship to drop explosive or incendiary bombs on fortified positions, moving columns, railway trains, supply depôts or munitions works, or on warships, submarines, and transports.

Such activities on the part of the airmen soon became so valuable in a military sense that the prevention of these efforts was essential, and this naturally led to the development of the purely combative side of aerial warfare, which soon passed from individual duels in the air to savage actions often at close range participated in by a number of aeroplanes of dif-

ferent types, where battle tactics of an elementary form were evolved as a result of training and drill to secure harmony of action.

Naturally this led to increased armament and armoring of the aeroplanes, and the calibre of the rapid-fire gun that soon took the place of the automatic pistol became greater, so that an air battle was indeed a serious matter, and the protection of fuel tanks and machinery and the design of machines to withstand as much penetration of the wings as possible figured prominently, as indeed did the entire question of design and construction for power, carrying capacity, speed, ease of manœuvring, and general reliability. Remarkable advances were realized, together with wholesale demands which taxed the facilities for manufacture in the belligerent nations as well as in America.

Flying corps existing in armies and navies on the outbreak of the War were greatly augmented and preparations made to train vast numbers of aviators. It was estimated that the various belligerent nations at the outbreak of the War possessed about 5000 aeroplanes and 109 dirigibles. Naturally Germany, where 12 Zeppelins and about 23 Parseval and Gross airships and about 1000 aeroplanes were available at the beginning of the War, was preeminent as regards numbers and trained pilots and observers, but here the policy of standardization and organization contributing so much to her efficiency in other fields was not of corresponding avail. A year's service, even less, demonstrated that much of the equipment so carefully assembled and standardized soon became obsolete and inferior with respect to the rapid developments that war conditions were bringing out for the Allies.

While the Germans had trained men in their aviation corps, the French, with perhaps 31 airships of nonrigid or semirigid types and possibly 1200 military aeroplanes of different designs, had fewer enrolled aviators at the outbreak of the War in actual service, but had a large number of expert civilians and their machines to call upon, so that soon there was organized a body of men whose equipment, both available and rapidly supplied, represented the note of progress ever peculiar to the French in this field. The organization and drill of the various units was done with remarkable military skill and care.

Great Britain, distinctly inferior in organization and equipment as well as numbers, for its aeroplanes hardly totaled 500 and its dirigibles but 15, at the beginning of the War endeavored speedily to repair these deficiencies, and while the defensive efforts to repel the Zeppelin raids were crowned with but moderate success, British aviators at the front and at sea achieved a good record. Russia, with 16 small airships and perhaps 800 aeroplanes, many of which were in poor shape, suffered from inadequacy of equipment, while in Austria and Italy from the outset aerial war was waged by both powers with a fair degree of preparation.

Aerial activities in war became not only important but indispensable under modern conditions, yet they did not have a direct and primary effect on the progress of the War itself, comparable, let us say, to the activities of the submarine. Indirectly the influence of aircraft on warfare proved enormous, but four years of experience indicated that there was but little direct military advantage in the attempts at

wholesale destruction of noncombatants, buildings, and material, by airplanes and dirigibles. The numerous air raids over Great Britain resulted in little positive military advantage and the "frightfulness" that they were to inspire soon gave way to a feeling of intense irritation on the part of the invaded.

1914-15. In the early weeks of the War, a Zeppelin dropped bombs over Antwerp, and at the end of August and on Sept. 1, 2, and 3, 1914, Taube monoplanes made daily visits to Paris, where, as in London, all street and other lights were extinguished and means hastily improvised to defend the city by searchlight and anti-aircraft guns, as well as to organize special fire-fighting facilities to deal with the results of incendiary bombs. On Oct. 11, 1914, another raid was made on Paris and bombs were dropped, some of which fell on the Cathedral of Notre Dame, while others damaged streets, sewers, and the underground railway, besides causing the deaths of three persons and injuries to 14. In the meantime the aerial defense of the city was being developed, but on Mar. 22, 1915, another raid was made on Paris, which, while resulting in little damage, nevertheless emphasized the need of a more complete system of defense. This was organized under General Hirschauer, former chief of the aeronautical department, and after it had been developed, Paris was free from attacks for many months.

Naturally an air attack on the British Isles was the goal aimed at by the Germans. Various reconnaissances were made by the Germans in connection with the flights on the Western front and the observation of the British navy. The first serious raid on Britain was on the evening of Jan. 19, 1915, and was directed against Yarmouth, Sandringham, and other points of the Norfolk coast. This raid was but a beginning, for on the night of May 31, 1915, the metropolitan section of London was reached and considerable damage was done, 41 lives being lost, while on June 6, another raid attended by 24 casualties was made on the east coast of England, and again on June 15, on this last 18 persons being killed and 40 injured. The attacks of the Zeppelins reached, perhaps, a climax on September 8-9 when the heart of London was reached, and the Zeppelins flying over Trafalgar Square were distinctly visible from the streets. The casualties of this raid were given as 20 killed and 88 wounded. The material damage was considerable. These raids continued during September over parts of the eastern counties. On October 13-14, London was again attacked by Zeppelins which, fearful of searchlights and gun fire, flew very high with a corresponding effect on the accuracy of their bomb dropping. The roll of casualties included 71 killed and 178 wounded. For a few months there was a lull in the air attacks on Great Britain, but the most serious raid came on the night of Jan. 31, 1915, when nine Zeppelins passed over the midland counties, dropping over 300 bombs. Here 71 were killed and 101 injured.

1916. Beginning Mar. 31, 1916, air raids were made over Great Britain for five successive nights and not only the eastern counties but even Scotland and the northeast coast were visited and bombs dropped. In one of these raids the Zeppelin *L-15* suffered severely from gun fire and was forced to descend and was captured by the British.

The aerial defense of Great Britain came in for considerable criticism both within and without Parliament and unfavorable comparisons with that maintained in France were made. Many Englishmen urged that too much had been done for defense and not enough in the way of offensive movements against the Zeppelins in their home ports and stations.

Such raids as these described stand out apart from their actual military significance, but they must not be allowed to eclipse the daily routine and the ever-increasing number of frequent combats on all the battle fronts of this great War. What was remarkable at the beginning of the War, such as visits of the German Taubes to Paris in August, 1914, or the bomb dropping by a Zeppelin on Antwerp on September 1, of the same year, soon became commonplace as did the bombing of the German hangars at Dusseldorf and Cologne by the Allies later in the month. Attacks on Friedrichshafen by the British and on Freiberg by the French followed, while a British raid on Cuxhaven on Dec. 25, 1914, was an early example of a number of aeroplanes working together. Air attacks and reconnaissances in force became more frequent, ever on a larger scale and with more elaboration of organization as well as with more powerful and more heavily armored machines. Bombing raids by aeroplanes were organized on a large scale by the French, especially with their heavier machines, and many of these were very successful. While both sides continually lost many aeroplanes in actual fighting, the Germans suffered severely with respect to their Zeppelins by accident as well as by gun fire.

Along with brilliant feats of individual aviators there was developed a tendency towards tactical formations and the use of many machines. Aeroplanes were assembled for flight over the enemy lines, difference in speed and armament making possible tactical dispositions of the greatest advantage. The Germans for a time had some machines of superior armament, and from August, 1915, heavier guns and armored aeroplanes figured and operations by flotillas became more general, these including the use of powerful bombing machines accompanied by armored scouts for their protection, and swift flying machines for reconnoitring. Aircraft were also used at sea against warships. Aeroplanes were also in evidence in the south and east, for the Russians attacked Constantinople in August, dropping bombs on the harbor forts, and from this time both sides were in active aerial warfare until the close of the Dardanelles campaign. The Austrians were active against Italy, and bombing raids were made against Brescia, Verona, Venice, Udine, and other points while the Italians in turn made attacks on Austrian territory.

Everywhere there was aerial activity and damage wrought by aeroplanes, yet unavoidably this was accompanied by wholesale destruction of machines and lives of aviators. As samples of air attacks, and in fact but little more here can be attempted, mention may be made of the bombing of a poison gas plant at Dormach on Aug. 26, 1915, by a French aviator, and a bomb attack on the royal palace at Stuttgart, a step, it was announced, taken in retaliation for German bomb dropping on unfortified towns and civilians. In every kind of operations aircraft aided, as at the battle in the attack on Artois, Sept. 25, 1915, when the British airmen

were prominent, and later at Verdun in the spring of 1916. Typical of a day's work for the airmen may be mentioned the British War Office report of Dec. 19, 1915, which announced 44 combats in the air on the Western front.

In 1916, everywhere there was increased aerial activity, a more active patrol service was maintained, and actions were frequent and serious. At sea aeroplanes were searching for submarines and scouting, and employment of airships and aeroplanes before and in a large naval battle for scouting and reconnaissance in a manner and on a scale somewhat corresponding to their use on land found a notable opportunity in the great fight off Jutland on May 31, 1916.

1917. In the battle of the Somme and during the great German retreat, General Haig depended on his air service to find out just what the Germans were doing and how far they had retreated. We find the aeroplane possibly used to its greatest advantage in the spring and summer campaigns on the Italian front and during their retreat to the Piave. Fleets of 150 or more machines would fly low to the ground and drop bombs on forming troops, lines of communications, munition dumps, or they would rake the enemy with machine-gun fire. One of the interesting outgrowths of increased air activity was the developing of the "camouflage" system. This means the covering of trenches, artillery and other things of military value with trees, painted scenes, etc., so that they could not be distinguished from the rest of the landscape from the air. This was of particularly great value because aeroplanes were compelled to stay 2 or 3 miles in the air as anti-aircraft guns were improved.

England was the scene of many raids during 1917. Only the more important will be noted here. Between May 23 and June 16, five air attacks were made. In almost all of these the Germans used aeroplanes instead of Zeppelins. In one attack, on May 25, 76 were killed and 174 wounded. The worst raid of the month was on June 13. It was carried out in broad daylight over London and resulted in the death of 159 persons and the wounding of 424. London was again attacked by a fleet of 24 aeroplanes which penetrated all the defenses (July 4); 37 were killed and 141 injured. On August 22, Yorkshire, Dover, Ramsgate, and Margate were raided. The Germans suffered heavily in this raid, losing eight Gotha machines. On the moonlight night of September 4, nine were killed and 62 injured in a raid on London. The defenses of London were now in much better shape and the Germans were compelled to give up their daylight attacks.

Raids were made on England on September 24, 25, 29, 30, and October 1. As a result of these, 52 were killed and 216 injured. The Germans carried them out with scarcely any loss to themselves, the British claiming only to have destroyed two machines. One of the most disastrous raids from the German point of view was made on the night of Oct. 19, 1917. At least 11 Zeppelins participated and on their way home, four were lost in French territory. One was captured undamaged at Bourbonne-les-Bains. On December 6, 25 Gotha planes attacked London, killing 10 and injuring 31. On December 18, 20 aeroplanes raided Kent, Essex, and London, killing 10 and wounding 70. In

these last two raids, three planes were forced to descend, and their crews were taken prisoner.

The consensus of opinion among the Allied nations was that these raids were of no military value and were merely another form of Germany's "frightfulness." Public opinion in England demanded reprisals, but for physical reasons the government refused to heed the popular clamor. Instead they gave their attention to the air bombardment of purely military centres such as the submarine bases at Ostend and Zeebrugge and the Krupp works at Essen. France made one or two spasmodic attempts to retaliate by bombarding towns in Alsace and Lorraine, but met with comparatively little success.

With the entrance of the United States into the War, it was felt that as soon as her resources were available the supremacy of the air would pass once and for all to the Entente Allies. She devised the standardized Liberty motor which was supposed to contain in one engine all the best points secured by foreign designers.

1918. On the nights of Jan. 21 and 24, 1918, British aviators carried out successful raids over Belgium and in German Lorraine, dropping bombs on Mannheim, Treves, Saarbrücken, and Thionville. During the month of January the Germans and Austrians were particularly active in carrying out raids over the Italian lines. Treviso and Mestre were bombarded on January 26; Venice, Padua, Treviso, and Mestre, on February 4 and 6, and on the latter date Calliano and Bassano were also bombed.

London was attacked on the night of January 28 and 58 persons were killed and 173 wounded. Another raid the next night killed 10 and injured the same number. On the 30th, Paris was heavily bombarded; 45 persons were killed and 207 wounded. During a raid on Venice on February 26, the Churches of Santa Giustina, San Simeone, Piccolo, and St. John Chrysostom were badly damaged. Naples was attacked on March 11. This resulted in the killing of 16 and the injuring of 40. A raid on Paris on Mar. 8, 1918, resulted in the death of 13 and the injuring of 50. Another raid which occurred on March 11 caused the death of 34 and the injuring of 79. Four German machines were brought down and 15 Germans killed or captured.

Italian aviators coöperating with the Allies on the Western front bombed Metz on Mar. 17 and 23, 1918, and raided the railway station at Thionville on the night of March 24. Paris was again the objective on April 12, when 26 were killed and 72 wounded. Italians raided Pola, Trent, and Trieste on May 10, and British forces coöperating with them attacked the aviation grounds at Campo Maggiore (May 4) and destroyed 14 machines.

On May 3, 1918, the British bombarded Karls-hütte and on May 16 brought down five German machines during an attack on Saarbrücken. British seaplanes attacked Ostend, Westende, and Zeebrugge successfully on May 6. London was again attacked on May 19, with a casualty list of 44 killed and 179 wounded; the British succeeded in bringing down five German aeroplanes. In an air raid over Cologne on May 18, 14 persons were killed and 40 injured. Raids were carried out by the Allies over railway stations in Lorraine and on a factory in Mannheim on May 21 and 22. The rail-

way station was destroyed and 26 persons were killed in Liège on May 26.

On June 14, 1918, the first American bombing squadron to operate behind the German front raided the Baroncourt Railway and returned safely. A second raid was carried out the same day when Conflans was attacked. On the night of Oct. 9, 1918, an expedition of more than 350 planes bombarded many towns in the American sector, with the loss of only one man. American activity in the Argonne sector was particularly noticeable. During a six-month period before the signing of the Armistice it is estimated that the American fliers brought down over 500 planes with a loss of about 70.

German Zeppelins again appeared in the rôle of raiders on the night of Aug. 5, 1918, when they made an attempt to raid the east coast of England. One machine was brought down 40 miles at sea, another was damaged, and the third was compelled to return. On the 12th, a Zeppelin was destroyed off the English coast. It fell in flames.

During the War the air raids on England caused the death of 1413 people and the injury of 3407. The vast majority of these were civilians. One hundred and ten raids were carried out by airships and aeroplanes. For a general discussion of aeroplanes and airships see AERONAUTICS.

Bibliography. During the years following the World War, considerable published material has appeared dealing with this great struggle both in the form of official documents and discussions by various individuals. Some of the more useful and significant volumes in this field are given in the following paragraphs:

Origins and Responsibility—Sidney B. Fay, *Origins of the World War* (2 vols., New York, 1928), a comprehensive and judicious survey by an American scholar (vol. 1 on diplomatic developments, 1870-1914, vol. 2 on the Serajevo crisis). Harry Elmer Barnes, *Genesis of the World War* (rev., New York, 1928), an able but extreme "revisionist" interpretation by an American, placing primary responsibility upon France and Russia. George Peabody Gooch, *History of Modern Europe, 1878-1919* (New York, 1923), an excellent account from a fair-minded British viewpoint. *British Documents on the Origins of the War, 1898-1914*, edited by Professor Gooch and Harold Temperley, three of the ten projected volumes appeared in 1927-28, covering the period from 1898 to 1906. G. Lowes Dickinson, *The International Anarchy, 1904-14* (New York, 1926), another able British presentation. Pierre Renouvin, *Economic and Social History of the World War* (trans., New Haven, 1927). Émile Bourgeois and George Pagès, *Les origines et les responsabilités de la grande guerre* (Paris, 1921). Erich Brandenburg, *From Bismarck to the World War* (trans., London, 1927), an excellent German account from a moderate viewpoint. Count Maximilian von Montgelas, *The Case for the Central Powers* (trans., New York, 1925). Alfred F. Pribram, *Austrian Foreign Policy, 1908-18* (London, 1923).

General Histories of the War.—Carlton J. H. Hayes, *A Brief History of the Great War* (New York, 1920), out of date on diplomatic origins but affording a valuable survey of the War itself. Albert F. Pollard, *A Short History of the Great War* (New York, 1920). John Buchan, *History of the Great War* (4 vols., New York, 1922). Frank H. Simonds, *History of the World War* (5

vols., New York, 1917-20). Ernest Lavisse, ed., *Histoire de la France contemporaine*, vol. XI, *La grande guerre et conclusion* (Paris, 1920-22), excellent French treatment. John Spencer Bassett, *Our War with Germany* (New York, 1919). John Bach McMaster, *The United States in the World War* (2 vols., New York, 1927).

Military, Naval, and Aeronautical Operations.—Winston L. S. Churchill, *The World Crisis, 1911-14* (New York, 1923); *The World Crisis, 1915* (New York, 1923); *The World Crisis, 1916-18* (New York, 1927); *The Aftermath* (New York, 1928), a brilliant survey of the War, prejudiced on political and diplomatic aspects but very penetrating on military and naval operations. Brig. Gen. James E. Edmonds, comp., *Military Operations* (4 vols., London, 1922-28). *Untersuchungsausschuss über die Weltkriegsverantwortlichkeit* (Official German documents relating to the World War, trans., Carnegie Endowment for International Peace, New York, 1923). *Diario della guerra d'Italia* (Italian official history, Milan, 1915-17). Gen. John J. Pershing, *Final Report* (Washington, 1919). Douglas W. Johnson, *Topography and Strategy in the War* (New York, 1917); *Battlefields of the World War* (2 vols., London, 1921). Sir J. S. Corbett, *Naval Operations* (3 vols., New York, 1920). Sir Henry Newbolt, *A Naval History of the War, 1914-18* (London, 1920). Admiral Viscount Jellicoe, *The Grand Fleet, 1914-16* (New York, 1919); *The Crisis of the Naval War* (New York, 1921). Admiral Reinhard Scheer, *Germany's High Sea Fleet in the World War* (trans., New York, 1920). Archibald S. Hurd, *The Merchant Navy in the War* (3 vols., New York, 1921-28). Admiral William S. Sims, *The Victory at Sea* (New York, 1920). Maurice Parmelee, *Blockade and Sea Power* (New York, 1924). H. A. Jones, *The War in the Air* (vol. ii, London, 1922-28). Ernst A. Lehmann and Howard Mingos, *The Zeppelins* (New York, 1927). Thomas G. Frothingham, *Naval History of the World War* (3 vols., Cambridge, 1924-26).

Economic and Financial Aspects.—Frederic A. Ogg and W. R. Sharp, *Economic Development of Modern Europe* (rev., New York, 1926)—consult excellent bibliographies appended to chapters. James T. Shotwell, ed., *Economic and Social History of the World War* (New Haven, 1926-28), a valuable series of monographs by scholars of numerous countries.

Memoirs and Bibliographies of Military Leaders, etc.—Among the many volumes under this head that have appeared, the following may be consulted. *British*.—Earl Grey, *Twenty-five Years, 1892-1918* (2 vols., New York, 1925). Earl of Oxford and Asquith, *Memoirs and Reflections, 1852-1927* (Boston, 1928). Viscount French of Ypres, *1914* (Boston, 1919). Sir William Robertson, *From Private to Field-Marshal* (Boston, 1921). Brig. Gen. John Charteris, *Field-Marshal Earl Haig* (London, 1929). Sir George C. A. Arthur, *Life of Lord Kitchener* (3 vols., New York, 1920).

German.—Paul von Hindenburg, *Out of My Life* (trans., New York, 1921). Erich Ludendorff, *Ludendorff's Own Story* (trans., New York, 1920). Erich von Falkenhayn, *The German General Staff and Its Decisions, 1914-16* (trans., New York, 1920). Theobald von Bethmann-Hollweg, *Reflections on the World War* (trans., London, 1920). Count Johann Heinrich von Bernstorff, *My Three Years in America* (trans., New York, 1920). William II, *The Kaiser's Memoirs*

(trans., New York, 1922). Admiral Alfred von Tirpitz, *My Memoirs* (2 vols., trans., New York, 1919). Gen. Liman von Sanders, *Five Years in Turkey* (Baltimore, 1927). Maximilian, Prince of Baden, *Memoirs* (2 vols., trans., London, 1928).

French.—Maurice Paléologue, *An Ambassador's Memoirs* (trans., New York, 1923-25). Raymond Poincaré, *Memoirs* (trans., New York, 1926). Maj. Gen. Sir George Grey Aston, *Marshal Foch* (New York, 1929).

American.—Charles Seymour, ed., *The Intimate Papers of Colonel House* (2 vols., Boston, 1926). Burton J. Hendrick, *Life and Letters of Walter H. Page* (2 vols., Boston, 1924). Maj. Gen. Hunter Liggett, A. E. F., *Ten Years Ago in France* (New York, 1928).

Russian.—Gen. Vladimir Sukhomlinov, *Erinnerungen* (Berlin, 1924). Gen. Yuri Danilov, *Russland im Weltkrieg, 1914-15* (Jena, 1925). Serge Sazonov, *Fateful Years, 1909-16* (London, 1928).

Other Countries.—Gen. Luigi Cadorna, *La guerra alla fronte italiana* (2 vols., Milan, 1921). Ahmed Jamal, *Memoirs of a Turkish Statesman, 1913-1919* (London, 1922).

International Law, Diplomacy, and Propaganda.—James W. Garner, *International Law and the World War* (2 vols., New York, 1920); *Prize Law during the World War* (New York, 1927). John Bassett Moore, *International Law and Some Current Illusions* (New York, 1924). R. B. Mowat, *History of European Diplomacy, 1914-24* (New York, 1927). F. Seymour Cocks, *The Secret Treaties and Understandings* (London, 1918). Harold D. Lasswell, *Propaganda Technique in the World War* (London, 1927).

WORLD-WAR CASUALTIES. The loss of human life was greater in the War of 1914-18 than in any previous conflict recorded by history. Almost twice as many men were killed as in all the wars from 1790 to 1913 inclusive. Among the major belligerents, Germany and Russia suffered the greatest loss in men killed and wounded, but in proportion to population, France paid an even heavier toll than Germany. That the Allies collectively suffered so much more heavily than the Central Powers was due to the fact that at least during the early stages of the War, the Central Powers were much better equipped with machine guns and artillery, whereas Russia, the heaviest Allied loser, sent her men into battle ill equipped, often without artillery support and sometimes without ammunition. The accompanying table gives a summary of military casualties for all countries.

In a few cases, notably for Turkey and Russia, only approximate estimate can be given. The figures given in the column headed "Wounded" do not indicate the number of different individuals wounded, since many individuals were wounded several times and hence were repeatedly listed as casualties. A fairly high percentage, however, of wound casualties resulted in permanent and serious injury. In the case of France, for example, the *mutilés*, or war cripples, numbered 740,000. If France be taken as typical, it is obvious that the number of men killed, permanently crippled, or permanently injured by gas, must have been well over 12,000,000.

The proportion of war deaths to the total populations of the belligerent nations was estimated as follows. Serbia, 1 to 12, France, 1 to 28, Ger-

Country	Men mobilized	Killed and died ^a	Wounded	Prisoners and missing	Total casualties	Casualties in percentage of total mobilized
Russia	12,000,000	1,700,000	4,950,000	2,500,000	9,150,000	76.3
France	8,410,000	1,357,800	4,266,000	537,000	6,160,800	73.3
British Empire	8,904,467	908,371	2,090,212	191,652	3,190,235	35.8
Italy	5,615,000	650,000	947,000	600,000	2,197,000	39.1
United States ^b	4,355,000	126,000	234,000	4,500	450,300	8.0
Japan	800,000	300	907	3	1,210	0.2
Rumania	750,000	335,706	120,000	80,000	535,706	71.4
Serbia	707,343	45,000	133,148	152,958	331,106	46.8
Belgium	267,000	13,716	44,686	34,659	93,061	34.9
Greece	230,000	5,000	21,000	1,000	27,000	11.7
Portugal	100,000	7,222	13,751	12,318	33,291	33.3
Montenegro	50,000	3,000	10,000	7,000	20,000	40.0
Total, Allies	42,188,810	5,152,115	12,831,004	4,121,090	22,089,709	52.3
Germany	11,000,000	1,773,700	4,216,058	1,152,800	7,142,558	64.9
Austria Hungary	7,800,000	1,200,000	3,620,000	2,200,000	7,020,000	90.0
Turkey	2,850,000	325,000	400,000	250,000	975,000	34.2
Bulgaria	1,200,000	87,500	152,390	27,029	266,919	22.2
Total, Central Powers	22,850,000	3,538,315	8,388,448	3,629,829	15,404,477	67.4

^a Includes deaths from all causes, in army.

^b Includes marines serving with army.

^c Includes 14,500 who died of wounds.

Sir Edward T. Cook, *The Press in War Time* (New York, 1920).

Political and diplomatic aspects of the War and its settlement will be found in the articles **WORLD WAR DIPLOMACY; PEACE CONFERENCE AND TREATIES; REPARATIONS; WASHINGTON CONFERENCE; LEAGUE OF NATIONS; RACIAL MINORITIES TREATIES; LABOR ORGANIZATION, INTERNATIONAL; EUROPE**. See also the sections *History* under the articles on the following countries: **UNITED STATES; AUSTRIA-HUNGARY; GERMANY; FRANCE; GREAT BRITAIN; ITALY; JAPAN; CZECHOSLOVAKIA; JUGOSLAVIA; GREECE; BULGARIA; ROMANIA; TURKEY; RUSSIA**.

many, 1 to 32; Austria-Hungary, 1 to 50; England 1 to 57; Italy, 1 to 79; Russia, 1 to 107; United States, 1 to 2000. The percentage of deaths per 100 men mobilized was undoubtedly the highest of any war for which records are available, with the possible exception of the Crimean War. More than four-fifths of the losses in the Crimea, however, were due to disease, while in the World War, disease deaths were inconsiderable, as compared with battle deaths.

Consult *Losses of Life Caused by War*, by Samuel Dumas and K. O. Vedel-Petersen (Oxford-Clarendon Press, 1923), and *The War With Germany*, by Colonel Leonard P. Ayres (Washington, D. C., 1919).

WORLD WAR DIPLOMACY. War has been defined as the last resort of diplomacy; it is also true that diplomacy is the handmaid of warfare. Diplomatic manoeuvres, that is to say, are necessary to support armies and navies, and the inverted maxim, "In time of war prepare for peace," is truer than in its original form. The magnitude of the World War, its long duration, the number of belligerents, and its far-flung consequences necessitated diplomacy on a scale almost spectacular, and contrary to the experiences after previous conflicts, the world hardly had to wait at all for a tolerably adequate diplomatic history of the war years 1914 to 1918, for in fact many documents were made available during the actual period of hostilities. In addition to exchanges of views and other communications between nations during the War itself, then parliaments held secret sessions in order that executives might quiet the alarms of the legislative representatives not only as to military situations, but as to diplomatic policies. Following the peace settlement, all sorts of disclosures were made, in official collections of diplomatic documents published by Foreign Offices; in memoirs by diplomats and generals who were concerned about their own reputations and wished to increase their incomes by large royalties; and in the revelations of the Russian revolutionary governments which were anxious to discredit the secret diplomacy of Europe and to strengthen their own argument that modern parliamentary institutions are bankrupt.

Elaborate efforts were made during the War to bring neutrals into the conflict. Discussions were carried on between the members of each group of powers involved as to their war aims and peace terms. Territories in the possession of the enemy were allocated in secret treaties at the same time that there was a brave show of appealing to the people in order to persuade them to accept the ideals and aims which, in public, statesmen professed to be fighting for. Negotiations for peace were conducted while the military situation was stable, and neither group of powers approached exhaustion. Some of these negotiations have been adequately disclosed. Other informal conferences and whispered words were more vital to the world than speeches. In some such cases the pertinent facts have only been meagrely hinted. But it is certain that in the future the question whether peace was missed and whether the War could have been ended before 1918 will be debated as violently as the question of the responsibility for the outbreak of hostilities in August, 1914. Some declarations of war were made without negotiation but were nevertheless slightly delayed. Austria declared war on Serbia July 28 but remained at peace with Russia until August 6. France and Great Britain declared war on Austria on August 10 and 12, but until August 27 Austria was in peaceable relations with Belgium so far as a formal declaration was concerned. Turkey, Japan, and Italy at first remained neutral. They began hostilities later, after mature deliberation. At first, the other Balkan states too were not directly affected. Both the Central Powers and the Entente made strenuous efforts to win over these neutrals or at least to keep them from joining the other side.

Japan. The Anglo-Japanese Alliance, the terms of which were known, seemed to make

Japanese support of England inevitable. When hostilities began, the British Ambassador to Japan asked Baron Kato, the Japanese Foreign Minister, whether Japan would aid England. The Cabinet Council was at once summoned, and the next day (Aug. 4, 1914) the Ambassador was told that Japan would not evade her responsibilities. Three days later the British Ambassador told Baron Kato that the situation had developed in such a manner as to require Japan's immediate entrance. The same day Premier Okuma called a meeting of the Genro, "the elder statesmen," and at this conference, it was said, Japan's policy was "definitely formulated" (Kawakami, *Japan in World Politics*, p. 250, New York, 1917). But on August 12 Marquis Okuma still talked of Japan's desire for peace and of the possibility of its being gratified. Japan issued an ultimatum to Germany on August 15, demanding the recession of Shantung, the dismantling of the Tsing Tau forts, and the departure of German warships from Chinese waters. A favorable answer to this ultimatum might have served to keep Japan out of the War, and in view of this possibility the phrase "in accordance with her obligations under the Anglo-Japanese treaty," which was used in the ultimatum, seems rather misleading. Germany rejected the demands, and war was declared. But Montenegro was brought in automatically by the attack on Serbia; the Russian threat against Austria determined Germany's position; the implication of Russia made France's course inevitable, so binding were the European alliances considered. On the other hand, Great Britain's entanglement only required an ultimatum by Japan to Germany, and Japan entered the War three weeks late. The delay had far-flung consequences, such as "the bombardment of Madras, the sinking of a new Blue Funnel liner with £1,000,000 worth of rubber in the Arabian Sea, the annihilation of Sir Reginald Craddock's squadron, with its gallant crews, and the Battle of the Falkland Islands." The Japanese Parliament was summoned in special session Sept. 3-9, 1914, to give its formal authorization for the expenses already incurred for the Tsing Tau expedition and to sign a blank check for additional outlays.

Turkey. The next power to come in was Turkey. There was no hope that the Young Turks would support the Entente, but on the other hand, there seemed a chance that war could be avoided with a power which had always considered one of its interests to be the maintenance of the Turkish Empire. England made promises. If Turkey would remain neutral, the status of Egypt would not be altered; the Entente would protect Turkish independence; the Capitulations would be abolished; and George V expressed to the Sultan his personal regret that Great Britain had commandeered (August 3) two battleships which were being built in England for Turkey. But on August 1 a treaty had been signed between Germany and Turkey. The latter was guaranteed territorial integrity against Russia. Mobilization proceeded, and on October 28 Turkey began naval operations. Three days later Russia declared war. Great Britain annexed Cyprus, and on December 17 she proclaimed a protectorate over Egypt. But the political effects of Turkish hostilities were much greater than these. The full participation of India was assured. Mes-

opotamia, Palestine, Syria, and Arabia became side shows for the main tent on the European front. In respect of Entente war aims, the entrance of Turkey was of tremendous importance. Russia saw the possibility of realizing her ambitions. As early as November, 1914, she was informed that she might have the Straits. On Mar. 4, 1915, Sazonoff demanded Constantinople, the western coast of the Bosphorus, the Marmora, and the Dardanelles; part of Thrace; the coast of Asia Minor between the Bosphorus and the river Sakaria; and islands in the Sea of Marmora. France and Great Britain agreed in general, if their own claims were satisfied; and thus there began a long series of demands and counterdemands for compensations and satisfactions, which were embodied in the Secret Treaties. These agreements were of a piece with the *Realpolitik* against which the Entente professed to be fighting; the secret ambitions were quite inconsistent with the war aims which were publicly professed. They were, moreover, ambitions which had extremely bad effects in the Balkans. In the eyes of Greece, Bulgaria, and Rumania, Turkey might really stand for Balkan independence. The Entente protection of "small nations" apparently was applicable only to Belgium. The little states of the Balkans were to be devoured by Russia.

Italy. The resources of the Entente were greatly increased six months later when Italy entered the War. She had declared her neutrality on Aug. 1, 1914, on the ground that intervention was not demanded by the terms of the Triple Alliance. Vienna, pressed by Berlin, had consented to cede the Trentino and the west bank of the Isonzo. Concessions had also been promised in Trieste and Albania. But these were not sufficient. There was much Italian sympathy for Belgium and Serbia. Sonnino saw that he could make the Central Powers and the Entente bid against each other. Prince von Bulow was called from retirement and was sent to the scene of his former diplomacy to lend his efforts to keeping Italy neutral. Burian succeeded Berchtold as Austrian Foreign Minister, and the concessions were slightly increased. But Sonnino feared both a Teutonic and Jugoslav dominance in the Adriatic; one of these results seemed inevitable whether the Entente lost or won, and if the War ended in a draw, the veteran Italian statesman believed that more could be expected from the Entente, whose statesmen were continually increasing their demands. France and Russia considered the Italian claims exorbitant. The latter particularly objected to the sacrifice of Serbian designs on the eastern coast of the Adriatic. But the diplomacy which looked to the resettlement of Europe was so universally selfish that the Powers could hardly object, when their own interests were not involved, to selfishness in each other. The situation on the western front, moreover, operated in favor of Italy. The Allies were repulsed at Neuve Chapelle and Ypres; the shortage of high explosives was becoming known. Consequently the Entente and Italy on Apr. 26, 1915, signed the Treaty of London. It promised Italy, in addition to the Austrian sacrifices, the southern Tirol to the Brenner Pass, Gorizia, Trieste, Istria, and northern Dalmatia.

Ribot is said to have remarked after a conference with the Italian representatives: "We

are lucky that they didn't take our clothes away from us." In return for the high price paid by the Entente, Italy promised to begin hostilities within a month and to prosecute them with all her resources. She pledged herself also to sign the Declaration of London of Sept. 5, 1914, by which the Allies promised that they would not make peace separately. Adhesion was not given until Nov. 30, 1915, although the Triple Alliance was denounced on May 3 and war was declared on Austria on May 23. Italy was technically at peace with Germany until Aug. 27, 1916. The terms of her entrance, furthermore, pledged the Allies to support Italy in preventing the Pope from acting to bring about peace or to settle any questions arising from the war. The only excuse for the treaty was "the familiar plea of necessity," according to Professor Gooch. "Though it increased the material strength of the Grand Alliance, it diminished its moral authority; and Serbia learned within a week of the pact which had disposed of Jugo-Slav territory behind her back." "The French and ourselves were fighting for our lives on the western front," Mr. Asquith said in apology, "and the treaty represented the terms on which Italy was prepared to join forces."

Bulgaria. Greece, Bulgaria, and Rumania now began to be drawn into the conflict. Immediately after the outbreak of the War, Venizelos promised that if the Entente would guarantee Greece against a Bulgarian attack, he would assist them in the event of Turkey's joining the Central Powers. King Constantine on the other hand announced that he would not attack Germany's allies before they attacked him. In December, 1914, the Entente offered South Albania, with the exception of Valona, and in January, 1915, Smyrna, in return for Greek intervention. Venizelos urged that an army corps be sent to Gallipoli; Constantine seemed to be willing. But he changed his mind on the advice of his General Staff, another example of the supremacy of military authorities over the politicians, and Venizelos resigned.

Meanwhile the Allies had been negotiating unsuccessfully for Bulgaria. Noel Buxton, an authority on the Balkans, told Sir Edward Grey early in August, 1914, that armed neutrality might be secured from Bulgaria by a revision of the Treaty of Bucharest and a loan. Sazonoff urged that Bulgaria be given territory in Macedonia, for her position was important. The Central Powers would get full benefit from the Turkish Alliance only if they were joined by Bulgaria. On the other hand if the Entente succeeded in luring Ferdinand, communication with Russia from the Mediterranean would be secured, and Turkey would be cut off. In 1915, when Russia suffered severe defeats in Poland and Galicia and the attack on the Dardanelles proved unsuccessful, the Entente saw that they must offer Bulgaria real compensations. On August 23, under pressure from the Entente, the Serbian *Skupstina* consented to territorial "sacrifices indispensable for the preservation of the vital interests of her people"; but it was too late. Serbia, indeed, wished to attack Bulgaria; but this, in the opinion of the Entente, would absolve Greece from her treaty obligation to go to the support of Serbia if the latter were attacked by Bulgaria. Ferdinand had by now decided that the Central Powers would win, and he wished to be one of the victors. In

September a military convention was signed. Germany and Austria promised to send 12 divisions against Serbia. Belgrade was entered on October 9, and two days later the Bulgarians crossed the frontier. Venizelos, in office again, promptly asked Great Britain to send 150,000 men and proposed that Greece fulfill her obligations under the treaty with Serbia. Even though Great Britain offered Cyprus for Greek intervention, Constantine determined to maintain neutrality and dismissed Venizelos. Serbia regretted that she had not been permitted to attack two months before; she was in a desperate position and without the support of Greece. Allied diplomacy in the Balkans had certainly failed; Sir Edward Carson resigned from the British cabinet in protest, and Sir Edward Grey may have been correct but was hardly reassuring when he said in a speech on October 14 that diplomacy could succeed only if supported by striking military successes.

Rumania. A year later Rumania, the fifth Balkan state to forsake neutrality, added her forces to those of the Allies after two years' flirtation. Rumania was bound to the Central Powers by a treaty concluded in 1883, but when the Kaiser and the Austrian Emperor promised to assist in obtaining Bessarabia for Rumania if she would join, King Carol discovered that he would not be permitted to fulfill his pledges. In September, 1914, Rumania signed treaties with Russia and Italy and promised benevolent neutrality. In January, 1915, a British loan was negotiated; in February the Italian agreement was renewed. When Italy left the Triple Alliance in May, 1915, Rumania announced her territorial demands, but they were too high. A year later Brusiloff's smashing blow on Austria led Germany to press for concessions to Rumania as the price of her continued neutrality, but Burian refused to yield. Again the Western Front forced the Allies to engage in the Balkan auction. On August 18, a secret treaty gave Rumania the Banat, Transylvania, and the Bukovina to the Pruth—one of the most indefensible ethnical arrangements of the war. Rumania declared war on August 28, but the time was unfortunately chosen. Military secrets had been betrayed; Rumania disregarded Entente advice in attacking Transylvania instead of Bulgaria, although from her own standpoint there was some justification for this policy; the Entente underestimated the forces that Germany could spare; Russian support was meagre and ineffective. Rumania was crushed.

The United States. Immediately on the outbreak of the War, the use of sea power by Great Britain and Germany raised controversies with neutrals, particularly the United States. German commerce was practically driven from the seas, and the United States began to discuss questions of international law relating to British restrictions on American commerce with Germany, and the ever-increasing American trade in munitions, practically all of which went to the Allies. The United States' professed willingness to sell to Germany was only a gesture, since the British navy determined the identity of the purchasers. A war zone was declared by Great Britain on Oct 13, 1914, when an Admiralty announcement said that His Majesty's government had authorized a mine-laying policy in certain areas and that it would be dangerous for ships to cross these limits. Three weeks later notice was given that "the

whole of the North Sea must be considered a military area." Ships were warned that they would "be exposed to the gravest danger from mines which it has been necessary to lay." Against this action the United States entered no protest, but England's command of the seas enabled her to afford pilots to American ships and to reduce to a minimum the possibility of disaster so far as the mines laid by her were concerned. The German "war zone" decree which marked the beginning of the controversy with the United States was of a more sinister character.

Submarine Warfare.—Late in 1914 Admiral von Tirpitz said that the submarine would be used to sink merchant vessels in British waters, but the rules of international law enumerating the exceptional cases in which prizes might be destroyed, the safety of passengers and crew always being a *sine qua non*, were so definite, and the considerations of humanity so potent, that such a method of warfare seemed highly improbable. On Feb 4, 1915, Germany issued a proclamation declaring "the waters surrounding Great Britain and Ireland, including the whole English Channel," to be a "war zone," and threatening the destruction of "every enemy merchant ship in the said war zone . . . without its being always possible to avert the danger" to passengers and crews. Neutral ships were also given a warning. This proclamation was justified as a retaliatory measure for Great Britain's interferences with German trade. Later (March, 1916) the ground of defense was shifted, and it was claimed that the use of the submarine against merchant vessels could not be illegal, because, the weapon being a new one, there were no rules on the subject. Against this announcement the United States, with other neutrals, protested vigorously. There was sent to Germany the celebrated "strict accountability" note of Feb. 10, 1915. Then followed a discussion of points of international law. Germany threw out the hint that if the Allies could be persuaded to adhere to the Declaration of London, she might withdraw her submarine and war zone order, and it is likely that at any time during the War she would have been willing to make this concession if permitted to import foodstuffs and if the trade in munitions between the United States and the Allies had ceased. Accordingly Secretary of State Bryan sent on February 20 to Great Britain and Germany identical communications, asking for mutual concessions so that an international *modus operandi* might be achieved which would not be fraught with such menaces to neutrals. No agreement proved possible.

The Lusitania.—American rights were first infringed by Germany on Mar. 28, 1915, when the British steamer *Lusitania* was sunk by a German submarine, and an American citizen was drowned. On May 1 the American vessel *Gulflight* was torpedoed by a submarine, and three American citizens met their death. Finally, on May 7, the *Lusitania* was sunk without warning, and more than 100 American citizens lost their lives. Before a protest could be made, two communications were received from Germany. The first expressed "deepest sympathy at the loss of lives on board the *Lusitania*" but maintained that the responsibility rested with the British government, which, through its plan of starving the civilian population of Germany, had forced Germany to resort

to retaliatory measures. The practice of arming British vessels made it impossible to treat them as merchant ships; and Germany regretted that Americans felt "more inclined to trust to English promises than to pay attention to warnings from the German side." In the second communication Germany explained that instructions had been issued to avoid attacks on neutral ships, and that in the event of an unfortunate accident regret would be expressed and damages afforded. On May 13 the United States sent Germany the first of a long series of notes. The legal questions were argued; the German excuses were answered, and the United States promised that it would not "omit any word or act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment." Whether the *Lusitania* was armed, the principles of humanity involved, and the justification of the submarine warfare as a reprisal for England's extensions of international law were argued. Against the English orders in council to extend contraband lists and to intercept shipments destined for neutrals because of a possible ultimate German destination, the United States was protesting at the same time that it carried on the submarine controversy with Germany. As Ambassador Page's letters and Count Bernstorff's despatches showed, President Wilson would have made these protests stronger if the German infractions of international law, causing loss of life, had not always kept American public opinion from being singly concerned with interferences with trade.

While the *Lusitania* case was being argued, the American steamer *Nebraskan* was torpedoed off the coast of Ireland; several Americans on the British steamer *Armenian* lost their lives on June 28; two Americans were killed when the *Arabic*, bound for New York and hence carrying no contraband, was torpedoed without warning on August 19. Finally, on September 1, Ambassador Bernstorff gave this pledge: "Liners will not be sunk by our submarines without warning and without safety of the lives of noncombatants, provided that the liners do not try to escape or offer resistance."

Trade in Munitions.—The *détente* resulting from this was used for a discussion of the trade in munitions, which had grown to large proportions. Germany's record in the past as an exporter of munitions and her controversy over submarines made it inadvisable for her to protest; so in June the Austro-Hungarian government sent the United States a strong note against the continued trade in munitions. Secretary Lansing answered on August 12 with an able argument covering all phases of the question, but by this time the American attitude was being influenced by considerations other than international law. Impeccable legality was supported by sympathy with the Allies. The invasion of Belgium, the *Lusitania* and other sinkings, the alleged atrocities, and Germany's evasive answers to Wilson's submarine notes, all helped to determine the American position.

Austria-Hungary now entered the submarine controversy. The Italian liner *Ancona*, bound from Naples to New York, was torpedoed in the Mediterranean without warning, and American lives were lost. After several interchanges, Germany's ally accepted the principle that "hostile private ships, insofar as they do not flee or offer

resistance, may not be destroyed without the persons on board having been placed in safety." But satisfaction with the theoretical agreement was short-lived. Three other passenger steamers were sunk in the Mediterranean, and Count Bernstorff, on Jan. 7, 1916, came to the fore with renewed pledges. Ships would be destroyed "only after passengers and crew have been accorded safety." Now the controversy shifted again, this time to the question of armed merchantmen. In the early part of 1916, Italian and British ships were armed on account of the ruthless submarine warfare which was being waged in the Mediterranean. On Jan. 18, 1916, Secretary Lansing proposed that the practice of arming vessels be abolished. His object was to have such vessels considered as auxiliary craft, to keep Americans off them, and to have a clearer case against Germany if submarines sank unarmed vessels and caused loss of lives. This proposal was unanimously rejected by the Entente Allies, who insisted that arming ships was justified by international law. Figures announced later by the British Admiralty showed that more than 75 per cent of all armed vessels escaped destruction by submarines, while of the unarmed only 24 per cent escaped when attacked. Germany took advantage of the proposals made by Lansing and announced that after March 1 all armed merchantmen would be sunk without warning. The diplomatic position of the United States had been weakened, and discussion of the matter began in Congress, where a resolution was introduced warning Americans to keep off armed merchant ships of belligerent nationality. The Administration interfered, and the resolution was tabled. But another element had been introduced into the submarine controversy.

Sinkings continued throughout 1916. An outstanding outrage was the case of the Channel steamer *Sussex*, an unarmed passenger boat, which was sunk without warning on March 24. After six weeks of talk, Germany declared that the submarine commander had made a mistake; his judgment of the character of the vessel had been too hurried, and it followed therefore that "the assurance given to the American government in accordance with which passenger vessels were not to be attacked without warning has not been adhered to in the present case." Sinkings in the next few months did not specifically involve American rights. On November 6, the *Araba* was torpedoed in the Mediterranean without warning; all the 450 passengers were saved. Six Americans had been killed on October 30. The two cases were coupled in Wilson's protests to Germany. The British admiralty announced that from May 5, the date of Germany's *Sussex* pledge, to October 28, 22 British merchant ships had been torpedoed without warning, and 131 noncombatants had lost their lives.

In spite of these cases, there was a feeling that Germany was standing by her pledges, barring unfortunate accidents or enthusiastic commanders' exceeding their instructions. There was a public discussion of the possibility of peace (December, 1916), but on Jan. 31, 1917, came the thunderbolt of Germany's decree of unrestricted submarine warfare. The "illegal measures" of Germany's enemies were to be met by "forcibly preventing after Feb. 1, 1917, in a zone around Great Britain, France, Italy, and in the eastern Mediterranean all navigation,

that of neutrals included, from and to England, and from and to France, etc. All ships met within that zone will be sunk."

"Overt Acts."—President Wilson announced his policy on February 3 in an address to the two houses of Congress in joint session. He quoted the solemn warning of his *Sussex* note, that unless Germany immediately abandoned her use of submarines contrary to international law and "the universally recognized dictates of humanity," the United States would sever diplomatic relations, and the German pledge in reply, that vessels would not be sunk in the war zone "without warning and without saving human lives, unless these ships attempt to escape or offer resistance." Ambassador Bernstorff had therefore been given his passports; Ambassador Gerard had been recalled. Only "actual overt acts" would make Wilson believe that the German government would go through with its plan, but if "American ships and American lives should in fact be sacrificed by their naval commanders in heedless contravention of the just and reasonable understandings of international law and the obvious dictates of humanity, I shall take the liberty of coming again before the Congress to ask that authority be given me to use any means that may be necessary for the protection of our seamen and our people in the prosecution of their peaceful and legitimate errands on the high seas."

Armed Neutrality—President Wilson did not have to wait long for "overt acts." Two American vessels were sunk, and an attack on the French steamer *Athos* caused the death of an American missionary. More serious was the virtual embargo on the mails and shipments of various sorts to Europe. With no protective measures decided on by the Wilson administration, American vessels were fearful of braving the submarine menace. At the end of three weeks it seemed clear that the threat of Wilson's address to Congress in breaking off diplomatic relations would have no effect, and so on February 26 he again addressed Congress, this time to ask for the authority which he deemed necessary to safeguard the rights of the United States. He desired "armed neutrality, which we shall know how to maintain and for which there is abundant American precedent." He was not "contemplating war or any steps that need lead to it." He asked for authority "to supply our merchant ships with defensive arms." A measure was immediately prepared by the Foreign Relations Committee and introduced in the Senate to carry out President Wilson's policy of armed neutrality. The resolution passed the House on March 1 by an overwhelming vote, but the rules of the Senate which failed to limit debate permitted a "group of willful men," in the Wilson phrase, to filibuster and prevent action before the time set for the Congress to come to an end. On March 9 Wilson issued a proclamation calling Congress in special session for April 16; the reason assigned was the necessity for a great variety of emergency legislation, but preparations for armed neutrality went on without legislative authorization. An old statute was relied on, and on March 12 it was announced that the United States had determined "to place upon all American merchant vessels sailing through the barred areas an armed guard." Meanwhile Germany continued to commit "overt acts." The *Laconia* was sunk on February 25,

and two American lives were lost. On March 12 the American steamship *Algonquin* was sunk, and 14 American members of the crew had to spend 26 hours in open boats. On March 19 the sinking of three American ships was announced. There were others also. These sinkings showed that armed neutrality was inadequate. On March 21 the President summoned Congress for special session on April 2, "to receive a communication by the Executive on grave questions of national policy which should be immediately taken under consideration;" steps were at once taken to mobilize the country for the prosecution of a war. It was practically a foregone conclusion that President Wilson intended to ask Congress to declare the existence of a state of war. The pretense of armed neutrality was anomalous and inadequate.

Entry into the War.—Four days after the President's address, both Houses of Congress passed the joint resolution formally recognizing the state of war which had been forced on the United States. It was the fifth formal declaration of a war with a foreign power. "We have no selfish ends to serve," said Mr. Wilson in his address. "We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make." The United States, at least, was not brought into the conflict by secret treaties.

Other Neutral States. In his message to Congress on February 3, President Wilson took it for granted "that all other neutral governments will take the same course" of breaking off diplomatic relations. This was not the case with European states, but the Latin American countries did follow the lead of the United States. Cuba and Panama joined the United States on April 7 and 8. Brazil broke off diplomatic relations on April 11 and declared war on October 26. Intercourse with Germany was also severed by Bolivia (April 13), Guatemala (April 27), Honduras (May 17), Nicaragua (May 19), Haiti (June 15), Costa Rica (September 23), Peru (October 6), Uruguay (October 7), and Ecuador (December 9). The Argentine, Chile, and Venezuela remained more or less neutral. Liberia declared war on August 7 and China on August 14. Siam entered the conflict on July 22. Others which came in in 1918 were: Costa Rica (May 23), Guatemala (April 22), Haiti (July 15), Honduras (July 19), and Nicaragua (May 24).

Greece also came in, but because of Allied pressure rather than on account of the submarine warfare. Venizelos had been dismissed in October, 1915, and from then until May, 1916, Constantine, strongly pro-German in his sympathies, tried to be a monarch who governed as well as reigned. He desired premiership of his way of thinking and called to the office Zaimis and then Skoloudis. In May, with the consent of Constantine, the Greek commanders allowed the Bulgarian troops to occupy Fort Rupel, the key to the Struma Valley. In August, Seres and Kavalla were also surrendered to the Bulgarians and the Greek troops were interned in Germany. Venizelos intervened. He established at Saloniki a provisional government which was recognized by the Allies, and he declared war on Bulgaria. The authority of the King was repudiated by Crete, Samos, and other islands, but the mainland remained under his control. Both Italy and Russia were reluctant

to have the Allies intervene drastically. Italy feared the rivalry of a Greece made strong under Venizelos, and Russia, on dynastic grounds, objected to the deposition of Constantine. In June, 1917, after the Russian revolution, the Entente at last intervened. Constantine was removed and sent to Switzerland. Venizelos returned to Athens, and on June 30 Greece broke off diplomatic relations with Germany and Austria.

The Secret Treaties. In order to get Italy and Rumania into the War and to arrange for a division of the spoils in the event of victory, the Entente entered into a series of secret treaties which were hardly consistent with their publicly professed war aims. Some of these treaties have already been referred to in discussing the negotiations which the Allies carried on in order to oppose to Germany a united diplomatic front. The secret agreements were so important, during the War and particularly at the Peace Conference, that they should be enumerated here. Most of them saw the light after the Bolshevik revolution. In publishing the documents which were found in the Russian Foreign Office, Trotsky said that "secret diplomacy is a necessary weapon in the hands of a propertied minority, which is compelled to deceive the majority in order to make the latter obey its interests." He declared that "the Russian people, as well as the peoples of Europe and of the whole world, must know the documentary truth about those plots which were hatched in secret by financiers and industrialists, together with their parliamentary and diplomatic agents."

The more important agreements were the following:

(1) Anglo-French agreement on Togoland, Sept. 13, 1914, and Kamerun, 1916

(2) The Anglo-French-Russian agreement of Mar. 20, 1915, regarding Constantinople, the Straits, Persia, and oil. Britain consented to the annexation by Russia of the Straits and Constantinople in return for a similarly benevolent attitude on Russia's part toward the political aspirations of Britain in other parts

(3) The pledge to Italy (the Treaty of London, Apr. 26, 1915) regarding the territories she should receive: the Trentino, the Southern Tirol, Trieste, Gorizia and Gradisca, Istria, Dalmatia, islands off the Dalmatian coast, northern Dalmatia, 12 islands off the coast of Asia Minor, a share in the partition of Asiatic Turkey, an addition to her colonial territory in Africa, and a share in the war indemnity. The treaty contemplated cutting Austria-Hungary off from the sea.

(4) The Russo-French agreement of Apr. 26, 1916, regarding the partition of Asiatic Turkey. Britain to obtain southern Mesopotamia, with Bagdad and two ports in Syria, France to obtain Syria, the Adana vilayet, and western Kurdistan, Russia to obtain Trebizond, Ezerum, Bitlis, Van, and territory in southern Kurdistan.

(5) The Sykes-Picot (Anglo-French) agreement of May 9, 1916, regarding the partition of Asiatic Turkey.

(6) The Rumanian treaty (Aug. 18, 1916) regarding the partition of Austria-Hungary. Rumania was to receive Transylvania up to the river Theiss, the Bukovina up to the river Pruth, and the Banat.

(7) The Franco-Russian agreement of February-March, 1917, regarding Alsace-Lorraine, the Saar Basin, the left bank of the Rhine, and Russia's western frontier. France recognized "Russia's complete liberty in establishing her western frontiers."

(8) The pledges to Japan, February-March, 1917, regarding German possessions in the Far East. This treaty was imperfectly known before the Peace Conference.

(9) The St. Jean de Maurienne Agreement, April, 1917, regarding Italy's prospective share in Asiatic Turkey. Italy was given complete possession of nearly the entire southern half of Anatolia, including the cities of Adalia, Konia, and Smyrna, together with a "zone of influence" northeast of Smyrna.

It is difficult if not impossible to reconcile these secret treaties with the public war aims of the Entente Allies. Certainly the agreements

were inconsistent with the promise that the Turkish portions of the Ottoman Empire should have "a secure sovereignty," and with the more general pledge of "free, open-minded, and absolutely impartial adjustment of all colonial claims, based on a strict observance" of the principle that "the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined." The Russian archives were opened just about the time that Wilson was announcing his famous Fourteen Points. Not the least curious feature of the preparedness which was being attempted for the Peace Conference was Wilson's apparent ignorance of both the fact and the contents of these secret agreements. They were published in England in the *Manchester Guardian* and in the United States in the *New York Evening Post*, which said that if there was "one man who has profited by the publication of the secret documents given out by the Russians" it was Woodrow Wilson. Ray Stannard Baker's volumes on Wilson at the Peace Conference make it clear that he was inadequately informed, and, indeed, Wilson confessed as much in his conference with the Senate Committee on Foreign Relations when the Treaty of Versailles was under discussion. Had he known in advance of the Conference of the existence of the secret agreements, it is possible that there would have been some cancellation of them. Allied dependence in the summer of 1918 on the United States for money and men was so great that selfish territorial aspirations would have been sacrificed. The safety of the state would have been a more pressing consideration than territorial aggrandizement in the event of a victory at that moment quite uncertain.

Peace Feelers. The historian of the future will have to deal minutely with the question whether the War in Europe could have been brought to an end sooner than Nov. 11, 1918. He will have to consider whether the statesmen, for refusing to agree to an earlier settlement, must not suffer greater condemnation than the generals who at particular moments were found wanting. The verdict to be rendered will be influenced by the hypnotic effect which a sweeping victory has on those who witness it and which it will always have on the historians who discuss it. Consequently, it is natural to expect that German historians will be chiefly interested in the problem. Indeed, one of the first acts of the Reichstag was to appoint a commission to determine whether peace was missed at the time of President Wilson's proposals in the autumn of 1918. The speeches of statesmen for the period 1916-18 and the published correspondence cover 250 closely printed pages (G. Lowes Dickinson, *Documents and Statements Relating to Peace Proposals and War Aims* [December, 1916-November, 1918], New York, 1919), and this collection does not include revelations which have since been made in various quarters. These secret discussions were by all odds the most important. The historian will surely say that the public pronouncements, apart from Wilson's speeches and a half dozen flashes from other Allied voices, were hasty, insincere, artificial, and forced. Rarely did they rise to the dignity and elevation which would have been worthy of the great issues involved, and which, indeed, were due the millions risking their lives.

Wilson's Attempts.—On Aug 5, 1914, President Wilson made his first attempt at mediation. He sent an identical message to Emperor William of Germany, Emperor Francis Joseph of Austria-Hungary, Emperor Nicholas of Russia, King George of Great Britain, and President Poincaré of France. He said: "As official head of one of the powers signatory to The Hague Convention, I feel it to be my privilege and my duty, under Article III of that Convention, to say to you in a spirit of most earnest friendship that I should welcome an opportunity to act in the interest of European peace, either now or at any other time that might be thought more suitable, as an occasion to serve you and all concerned in a way that would afford me lasting cause for gratitude and happiness." The belligerents made only formal acknowledgment of this offer. After the German retreat from the Marne, President Wilson, on unofficial suggestions by Count Bernstorff, had Ambassador Gerard sound out the German Chancellor, who replied that since the War had been "forced" on Germany, the President should first appeal to the Entente. Colonel House went abroad for the President during the winter 1914-15 and on his return reported that the moment for peace had not yet come. On June 2, 1915, in discussing the *Lusitania*, President Wilson told Bernstorff that if Germany would give up the use of submarines, he could persuade the English cabinet to agree to abandon the attempt to starve Germany, and he "hoped that this would be the beginning of peace action on a great scale." In January, 1916, Colonel House again went to Europe. He found the chief opposition to peace in Paris and a certain willingness in Berlin and London. Many discussions were held between Bernstorff and Colonel House, in New York City, in order to avoid the publicity which White House conferences would have entailed. "House told me," Bernstorff later reported, "that Wilson no longer had the power to oblige England to obey the practices of international law [this was just after the *Sussex* affair]; American trade was so intimately tied up with the Entente that Wilson could not possibly disturb these trade relations without evoking a terrific storm. On the other hand, he was in a position to obtain a peace without victory, and he intended to do so as soon as an opportunity offered itself. But seeing that such a step would now be universally called pro-German in America, he could only do it when public opinion about relations with Germany had somewhat calmed down. He proposed a pause and hoped without fail to be able to make a beginning of peace mediation toward the end of the summer." Rumania entered the War; the Entente became more certain of victory; and intervention was deferred.

Meanwhile, Bethmann-Hollweg had been thinking of the possibility of peace discussions. Paléologue's memoirs record evidences of approaches, some probably unauthorized, from Berlin, Darmstadt, and Vienna. Russia also had taken soundings. In October, 1916, the Emperor transmitted through Ambassador Gerard a memorandum to the effect that he was willing to entertain a peace offer, but the approaching presidential election caused a delay. Bernstorff endeavored to delay the German overture until Wilson could act, but on Dec. 12, 1916, a few days after the fall of Bucharest, Beth-

mann-Hollweg issued a note which said that the resistance of the Central Powers could not be broken but that animated "by the desire to stem the flow of blood and to bring the horrors of war to an end, the four allied Powers propose to enter even now into peace negotiations." On December 18 President Wilson issued his famous appeal for peace. He was "somewhat embarrassed to offer it at this particular time, because it may now seem to have been prompted by the recent overtures of the Central Powers. It is in fact in no way associated with them in its origin." To the popular mind this was difficult to believe, but it was true. As Bernstorff later told the Reichstag investigating committee, "the peace note which Wilson despatched on December 18 had been composed as far back as the middle of November but had been thrust by Wilson into his writing-table, because another wave of anti-German feeling swept through the country on account of the Belgian deportations. Colonel House told me that the peace offer which was already drawn up by the middle of November was not sent off by Wilson because he could not be responsible for it in the state of public feeling." On November 24 Bernstorff had telegraphed: "Wilson has commissioned Colonel House to tell me in the strictest confidence that he would undertake an effort for peace as soon as possible, presumably between now and the New Year. But meanwhile he made it a condition that we should discuss peace as little as possible, and that we should allow no new submarine controversies to spring up, in order to prevent a premature refusal by our enemies."

Allied Sentiment.—All the Allies vigorously denounced the German offer as an attempt to divide them. The general feeling was well expressed by the British note. "To enter, on the invitation of Germany proclaiming herself victorious, without any knowledge of the proposals she has to make, into a conference, is to put our heads into a noose." On December 25, while waiting for the Allied reply to her proposal, Germany made an answer to President Wilson's appeal for a definition of war aims and peace terms. The note said nothing at all about terms; it proposed instead "an immediate meeting of delegates of the belligerent states at some neutral place." When the German reply was received, Bernstorff "telegraphed that Lansing had begged him at any rate to communicate our peace terms to him in confidence." The Allies, however, seized the opportunity which President Wilson's appeal offered them. They had not as yet drawn up any coherent programme. They had divided up the spoils in the secret treaties, but their public pronouncements had been general and not particular. The Allied reply pledged wholehearted support of "a League of Nations to ensure peace and justice throughout the world" and then went on to enumerate the essential elements of a satisfactory settlement: the restoration of Belgium, Serbia, and Montenegro, with compensation; the evacuation of French, Russian, and Rumanian territories, with reparation; the liberation of Italians, Slavs, Rumanians, and Czechoslovaks from foreign control; the expulsion of Turkey from Europe, and the restitution of provinces previously torn from the Allies by force and against the wishes of their inhabitants.

German Conditions.—On Jan. 11, 1917, Germany and Austria sent notes to the neutral

states declaring that the Entente must bear the responsibility for continuing the bloodshed. Meanwhile preparations were proceeding in Germany for unrestricted submarine warfare; Wilson made his famous "peace without victory" speech to the American Senate (Jan. 22, 1917) and pressed Germany for a statement of her conditions. According to Bernstorff, President Wilson was quite hopeful of the successful outcome of the negotiations. The German Ambassador reported to his government on Jan. 27, 1917, that "Wilson was convinced that he would be able to bring about both peace conferences" and that the Entente note was a bluff. The Chancellor, in a frantic effort to win the race from the military leaders who were insisting on submarines rather than peace talk, did telegraph some terms on January 29. He refused to allow them to be published, "for they would look like weakness." But the documents printed in the report of the Reichstag committee show that the military leaders were not modest in the demands which they proposed to make of the Allies, and it was they, rather than Bethmann-Hollweg, who really governed Germany. The Chancellor, before he could even talk to Baron Burian about Austria's terms, had to obtain the consent of the General Field Marshal and the Emperor. The terms discussed included the annexation of Courland and Lithuania; the retention of Briey and Longwy; the return of the colonies with the exception of Kiaochow, the Carolines, and the Marianna Islands, and in compensation therefor the acquisition of the Congo State or a part of it; the indemnification of Germans living abroad, and the incorporation of Luxemburg into the German Empire. In January the Emperor became even more severe and said that the German war aims must be recast. He was then unwilling to allow King Albert to return to Belgium and declared that the coast of Flanders must belong to Germany. But it was too late. Germany would have to fight for these results on the battlefield rather than in the conference room. The U-boat campaign could not be postponed; 21 boats had left for their stations and could not be communicated with. The submarine was to bring the United States into the War, and "force without limit" instead of "peace without victory" was thereafter to be Wilson's hope.

The Year 1917—Meanwhile peace discussions were beginning in another quarter, and they continued through 1917. The time was not unfavorable, and the public manoeuvres furnished a not inappropriate screen for the backstairs pourparlers. In July the Reichstag passed its famous "majority resolution" calling for "a peace of understanding and the permanent reconciliation of the peoples." Bethmann-Hollweg had resigned in favor of Michaelis, who in turn was to be replaced in October by Hertling and a semiparliamentary combination which accepted the Reichstag's programme. August found the Pope publicly appealing for peace; Count Czernin made speeches emphasizing disarmament; Russia was demanding a discussion of war aims; the Socialists in the belligerent countries were attempting meetings, and even a Conservative like Lord Lansdowne cried out to stop the slaughter and save European civilization. During the summer of 1917 the morale of France was at its lowest point, and Caporetto, Byng's failure at Cambrai, and the Bolshevik revolution were hardly encourag-

ing to the Allies. President Wilson seemed to be willing that, while no compromise could be made with Prussia, the Allied cause should be strengthened by a diplomatic offensive which might affect the peoples of the Central Powers; and since Austria-Hungary was obviously weary, he and Lloyd George thought of the possibility of a separate peace. Any agreement with Germany at this time would have meant Prussian hegemony in the East; the Allies needed no proofs of this, even before Brest-Litovsk. Hence there was an effective veto on an "unclean" peace, and a military offensive on the western front, however horrible and uncertain, was not too high a stake to risk for the defeat of Germany's eastern ambitions.

The Austrian Attempts—This, in brief, was the situation when Austria sued for peace. Emperor Karl, on coming to the throne in November, 1916, had expressed his desire to end the conflict and had called attention to the fact that he had had no share in its beginning. The emissary now employed was Prince Sixtus of Bourbon, the brother of Empress Zita. In January the Prince learned from his mother in Switzerland that the Emperor was ready for a secret armistice with Russia and that he was also willing for the restoration of Alsace-Lorraine and the creation of a Jugo-Slav kingdom. In March the Prince, going to negotiate with Poincaré, took with him an autographed letter from the Emperor. The dossier of the Prince has now been published, and it is a document of great interest, both in the facts which it discloses and in the revelations which it makes concerning the mental attitudes of the statesmen who during the War had peace or a continuance of the conflict within their discretion. They consulted no one. It appears from the dossier that Lloyd George, with whom the Prince had several interviews, was sincerely anxious to deflect Austria but was hampered by obligations toward France, Italy, and Russia. President Poincaré, on the other hand, was almost willing to abandon Italy. "France's interest," he declared, "is not only to maintain Austria, but to aggrandize her at the expense of Germany." In a later interview he was almost willing to desert Poland and Rumania; too much had been promised the smaller allies. Ribot appears always to have been a bitter-end, but if there had been complete willingness on the part of England and France, Italy would have proved a stumblingblock. Sonnino, in Lloyd George's phrase, was "obstinate, difficult, and troublesome." Austria did not propose sufficient territorial concessions to satisfy Italy. Austria's position, indeed, was hopeless. Defeat would mean her dissolution, and victory would mean complete German dominance. Russia and the United States were only imperfectly informed of these transactions. It seems possible that if the decision had rested with Poincaré and Lloyd George, Germany in the spring of 1917 might have found herself separated from her Allies. Austria and France, from time to time, continued their discussions, through meetings between Count Revertera and Count Armand in Switzerland.

The Pope's Efforts.—Other unpublished conversations are alluded to in the Prince Sixtus document. Mention is made of one between Bulgaria and England, one between Austria and Italy, and several between Austria and Russia. On Aug. 14, 1917, the Pope issued a peace note,

to which President Wilson replied that the rulers of Germany could not be trusted. At the same time the Vatican was making private efforts; it did secure Germany's consent to the restoration of Belgium, but the German government took the position that conversations were possible only if the conflict ended in a draw.

Germany.—Meanwhile, also, Germany herself was "feeling out" France. Proposals were made in June and August by Baron Lancken, the political director of the German government in Brussels, that Briand, who was in Ribot's cabinet, should go to Switzerland to meet Lancken or even the German Chancellor himself. The territorial suggestions were not dissimilar to those in the Sixtus negotiation. Austrian territory, Trieste and Trentino, was to be ceded to Italy, just as in the Sixtus attempt Austria was free with Alsace-Lorraine. Germany, according to Briand's later explanation in the Chamber, was willing to discuss the restoration and even compensation of Belgium and was willing to compromise on Alsace-Lorraine. Briand asked permission to meet Lancken, and in this he was supported by Belgium and Rumania; but Ribot refused. Briand then asked that the Allies be consulted, and to this Ribot consented, but Briand later expressed his opinion that the proposals were presented in such a way that their rejection was probable. President Wilson and Kerensky were informed only after the incident had been concluded. In the following month there was a new French Cabinet, Poincaré became Prime Minister, with Ribot as Minister for Foreign Affairs. There was a secret session of the Chamber of Deputies at which Briand revealed the proposals made by Germany and assailed Ribot for his rejection of them without further investigation. Ribot was forced to resign. Villalobar, the Spanish Minister at Brussels, inquired in London as to the British attitude toward the integrity of Germany, indemnities, and economic boycotts. A conference of Allied ministers agreed that this was another attempt to separate them. In January, 1918, the Allies' aims were more explicitly defined in Wilson's Fourteen Points as well as speeches by Lloyd George. Discussions behind the scenes still proceeded. General Smuts and Count Monsdorf met secretly in Switzerland; Armand and Reverera met again; the Bavarian Törring-Jettenbach and the Belgian Minister at Bern saw each other, and the King of Denmark asked Germany for her terms.

Final Austrian Attempt.—One other overture demands special mention, since, in the opinion of R. W. Seton-Watson, a leading authority on eastern European politics, it alone had any serious prospect of success. In February, 1918, the late Professor Lammasch, known to Americans for his service on The Hague Court and his connection with the Carnegie Endowment for International Peace, made a direct appeal to Washington in the name of Emperor Karl. President Wilson was asked to make a pronouncement that the United States regarded Germany and Austria-Hungary in different lights, and that Austria-Hungary would receive favorable terms if she granted her subject nationalities autonomy. The speech was made to Congress on Feb. 11, 1918. "Count Czernin," said President Wilson, "seems to see the fundamental elements of peace with clear eyes and

does not seek to obscure them." Lammasch then introduced an autonomy bill in the Austrian Herrenhaus, but he was bitterly attacked. Germany got wind of the scheme and the Austrian defection was checked.

Most of the disclosures made up to 1924 as to these peace feelers appeared in private memoirs. One motive for publication has been to accuse various personalities of their responsibility for continuing the struggle, and both the source and the tendentious character of the documents invalidate them as trustworthy evidence for the judgment of Allied statesmen. Although the official documents of the British, German, Russian, Austrian and other European Foreign Offices bearing upon the origins of the War had either been published or were in process of publication in 1929, it was realized that comparatively little of an official nature had been disclosed concerning the peace feelers. It seemed likely that this material, or at least many of the more important documents, would be withheld until after the death of the outstanding personalities concerned. It was nevertheless strikingly evident that a few statesmen of both the Allied and Central Powers held the decision of peace in their hands, subject to no check except a vague and on occasion controllable public opinion.

War Aims. Late in 1917 and early in 1918 the increasing war-weariness, the knowledge of the imperialistic character of the Allied Secret Treaties, and the failure of the peace moves to hasten the end of the War, quickened the impatience of the Allied peoples. This attitude manifested itself in the statement of war aims incorporated in the British Labor Memorandum of December, 1917. Founded on Wilson's precept that "the world must be made safe for democracy," and taking a stand categorically against a war for conquest, the Labor statement called for the establishment of a League of Nations, restoration of Belgium, self-determination for Alsace-Lorraine and the Italian peoples in the Dual Monarchy, civil and political liberties for the Jews, the reorganization of the Balkans, and recognition of the national claims of the Czechoslovaks and the Jugo-Slavs. This was followed by the speech of Lloyd George on Jan. 5, 1918, which accepted the Labor position in substance. The following specific items are interesting to note. The Allies were not fighting against the German people and were not seeking to destroy or disrupt the German people or Germany; they were not fighting to destroy Austria-Hungary or to seize Constantinople and Thrace, "which are predominantly Turkish in race." But it was President Wilson's famous speech of January 8, before Congress, that overshadowed all other such statements. This contained the Fourteen Points that served as the basis for the German Armistice. These points were:

I. Open covenants of peace, openly arrived at, after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view.

II. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

III. The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

IV. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

V. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined.

VI The evacuation of all Russian territory, and such a settlement of all questions affecting Russia as will secure the best and freest cooperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy, and assure her of a sincere welcome into the society of free nations under institutions of her own choosing, and, more than a welcome, assistance also of every kind that she may need and may herself desire. The treatment accorded Russia by her sister nations in the months to come will be the acid test of their good will, of their comprehension of her needs as distinguished from their own interests, and of their intelligent and unselfish sympathy.

VII Belgium, the whole world will agree, must be evacuated and restored without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

VIII All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which has unsettled the peace of the world for nearly 50 years, should be righted, in order that peace may once more be made secure in the interest of all.

IX A readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality.

X The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

XI Rumania, Serbia, and Montenegro should be evacuated, occupied territories restored, Serbia accorded free and secure access to the sea, and the relations of the several Balkan states to one another determined by friendly counsel along historically established lines of allegiance and nationality, and international guarantees of the political and economic independence and territorial integrity of the several Balkan states should be entered into.

XII The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

XIII An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

XIV A general association of nations must be formed, under specific covenants, for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

On Jan. 25, 1918, Count von Hertling for Germany and Count Czernin for Austria-Hungary disavowed any imperialistic designs, but the conduct of the German Military Headquarters at the Brest-Litovsk negotiations once more indicated that the fair promises of German statesmen were to be lightly regarded. On February 11, President Wilson set forth, in a reply to the above speeches, "Four Principles" on the acceptance of which a discussion of the terms of peace would be possible. These were, in brief: (1) each part of the final settlement to be based on the essential justice of that particular case; (2) people and provinces not to be hartered from one sovereignty to another as if they were chattels; (3) every territorial settlement to be made in the interest of the populations concerned; (4) national aspirations to be satisfied to the utmost without introduction or perpetuation of elements of discord. On

July 4, another speech added to the theoretical character of the Wilson conception of a just peace. Here, President Wilson laid down "Four Ends" which "can be put into a single sentence. What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind." Finally, on September 27, there came these "Five Particulars" to round out finally the Wilsonian principles:

I The impartial justice meted out must involve no discrimination between those to whom we wished to be just and those to whom we did not wish to be just.

II No special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all.

III There can be no leagues or alliances or special covenants and understandings within the general and common family of the League of Nations.

IV And, more specifically, there can be no special selfish economic combinations within the League, and no employment of any form of economic boycott or exclusion, except as the power of economic penalty, by exclusion from the markets of the world, may be vested in the League of Nations itself as a means of discipline and control.

V All international agreements and treaties of every kind must be made known in their entirety to the rest of the world.

On October 4 a German peace note, despatched to President Wilson, accepted the Fourteen Points as the basis of a peace; on October 7, an Austro-Hungarian note agreed to the principles adumbrated in the Fourteen Points, the Four Principles, and the Five Particulars. The rest of the world, too, looked on these lofty utterances as the only possible elements of the creation of a just and enduring settlement.

Russia. The intervention of the United States and the Russian revolution marked the turning-point of the War. In a way the two events were complementary, but on the other hand they also served to neutralize each other. Russian participation in the fight against "autocracy" had always been an anomaly; the régime of the Czar was the most autocratic in Europe. The Russian revolution, with the ensuing war-weariness and a separate peace, would have robbed the Entente of victory but for aid from America. The revolution occurred three weeks before the United States declared war. The new government announced that its object was "to establish a durable peace on the basis of the rights of nations to decide their own destinies." There was a turn to the Left in the latter part of May, and Kerensky, who came to power, appealed to the Allies for a restatement of their war aims. Little moral assistance was given him, but it was indispensable if Kerensky was to make concessions to the growing power of the Soviets and at the same time remain loyal to the Entente. The Allied leaders, moreover, were hostile to the idea of a labor conference at Stockholm to discuss the possibilities of peace; Lloyd George was willing, but his colleagues disagreed. Kerensky was able to spur his southern armies to one offensive, but its strength was shortlived. In November Kerensky was overthrown by the Bolsheviks. Lenin became president of the Council of People's Commissars, and his first aim was to make peace. An armistice with Germany was signed on December 3, and negotiations began at Brest-Litovsk on December 22. Germany insisted on retaining her conquests of Russian territory; she claimed that Lithuania, Courland, Poland and Esthonia desired separation from Russia.

Trotsky, who was Russian foreign minister, denounced this action and maintained that "self-determination" should be allowed the populations affected. On March 3 the peace was signed, and it was ratified a fortnight later by the Congress of Soviets. By the agreement Germany promised not to send troops from the Eastern to the Western Front, but she ignored this pledge. An offensive on the West was her chief purpose in securing the peace. The defection of Russia thus made possible the operations which began in March, 1918. It also contributed to a redefinition of the war aims of the Entente, an action which should have been taken while Kerensky was in power. Peace with Rumania was signed on May 7.

Bulgaria and Turkey. There was little discussion of politics or diplomacy during the summer of 1917. The issue of the War was being determined by Ludendorff's great offensive. (See *WAR IN EUROPE, Eastern Front*.) German defeat was foreshadowed by Foch's counteroffensive which began on July 18. Two months later peace began to be discussed. On September 15 Austria issued an appeal for the verbal discussion of peace. President Wilson replied that his terms had already been stated in the Fourteen Points and that a conference was impossible. Ten days later Bulgaria collapsed. Before the month was out the Turkish army in northern Mesopotamia surrendered, an armistice was signed, and the Straits were opened to the Allies.

The Armistices. Austria-Hungary, meanwhile, was having internal troubles. At different times during the summer of 1918, France, Great Britain, and the United States recognized the belligerency or independence of the Czechoslovaks, and thereafter the Slav deputies in the Austrian Reichsrat openly defied the government. In the event of Allied victory, the Jugo-Slavian, Italian, and Rumanian parts of Austria-Hungary were, by treaties and engagements, already negotiated to Serbia, Italy, and Rumania respectively. The Bulgarian surrender was the beginning of the end. At the opening of the Austrian Reichsrat three days later, Prime Minister Hussarek delivered a pathetically ludicrous address about "setting" the Austrian "house in order" and "considering and solving the problem of autonomy for the different nationalities." Mere autonomy within the Dual Monarchy was now hopelessly anachronous. The Monarchy was doomed, as were its coequal parts, the Empire and the Kingdom. On October 4, Germany, Austria-Hungary, and Turkey offered to negotiate peace on the basis of President Wilson's Fourteen Points and subsequent addresses. On October 8 Wilson asked the German Chancellor whether he was "speaking merely for the constituted authorities of the Empire." By wholly ignoring the Austro-Hungarian government he clearly indicated that he regarded that government as incompetent to speak for its peoples. Thereupon a panicky attempt was made to create a coalition cabinet which would be somewhat representative of the various nationalities. The Czechs and other nationalities refused to be led into such a trap. There were also evidences that Hungary was ready to scuttle the sinking Austrian ship in the hope of appearing herself in the guise of a submerged and oppressed nationality.

President Wilson's note of October 18 in effect demanded as a condition for the negotia-

tion of peace the independence of the Czechoslovaks and Jugoslavs. On the same day, the Czechoslovak National Council, sitting in Paris, declared the independence of Czechoslovakia and constituted itself the provisional government of the country. The German members of the Austrian *Abgeordnetenhaus*, realizing that the end was at hand and ignoring both the Dual Monarchy and the Austrian Empire, constituted themselves a provisional national assembly to represent the German-Austrian people at the peace table. Meanwhile there had been a change of government in Germany. Prince Max of Baden had been appointed Chancellor and his cabinet included representatives of labor. On October 8 Wilson asked three questions: Did Germany accept the terms of the Fourteen Points and subsequent addresses? Would troops be withdrawn from invaded territory? Did the Chancellor speak merely for the Imperial authorities who had so far conducted the War? Further interchanges were necessary before Germany answered these questions to Wilson's satisfaction, and on October 23 he transmitted the correspondence to the Allies. Ludendorff resigned on October 27, and the German retreat became almost a rout. On November 4 the Allies announced that they were willing to make peace on the basis of the Fourteen Points and the principles enunciated in subsequent addresses of Wilson. They reserved complete freedom of action in respect of the interpretation to be given the phrase "freedom of the seas," and they understood by the "restoration" of the invaded territories "compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air." A republic was proclaimed in Germany; the Kaiser abdicated on November 9, and two days later the Armistice was accepted. Wilson's speeches were to form the basis of the peace terms to be agreed on at the Paris Conference, but there, they were to give way frequently to the secret treaties.

Bibliography. A useful work to be consulted in this connection is R. B. Mowat, *A History of European Diplomacy 1914-1925* (New York, 1927) which gives specific references to original documents and sources so far as they are available. The Carnegie Endowment for International Peace has reprinted many interesting documents referring to the World War on its diplomatic side, such as *Diplomatic Documents relating to the Outbreak of the European War*, edited by J. B. Scott (New York, 1916). The works cited under the appropriate subheads in the *Bibliography* accompanying the article *World War* may be referred to with profit in this connection. See *WORLD WAR; PEACE CONFERENCE AND TREATIES*.

WORTHINGTON-EVANS, Rt. Hon. Sir LAMING, FIRST BARONET (1868-). A British public official. He was a solicitor from 1890 to 1906. In 1905 he was on the Board of Trade committee for the reform of the company law, which led to his publication of *Notes on the Companies' Acts* (5 eds., 1900-07), and *Notes on the Companies' (Consolidated) Act* (1908, joint author 1909). In 1910 he entered Parliament as a Conservative for Colchester, later becoming controller of the Foreign Trade Department of the Foreign Office (1916), Parliamentary Secretary to the Ministry of Munitions (1916-18), Minister of Blockade (1918), Minister of Pensions

(1919-20), Minister without Portfolio (1920-21), Secretary of State for War (1921-22 and 24-29), and Postmaster General (1923-24).

WOUNDS, TREATMENT OF. The experience of the World War presumably made some changes in the treatment of wounds in civil and industrial surgery, which were summed up by a Viennese surgeon, Professor Albert, as follows: Mere asepsis or surgical cleanliness was found to be quite insufficient to control war wounds after these had had time to become infected. In other words, the original Listerian doctrine of antiseptic treatment, once sidetracked, again took the lead. It was learned that, while chemical agencies are unable to arrest infection by destruction of bacterial life, they are still able to antagonize the latter by stimulating the natural defensive forces of the body. As for tissues hopelessly infected, they may be cut away bodily to a certain extent. Ultra-violet light and tincture of iodine are able to destroy a certain number of bacteria. Mechanical resources, such as proper drainage and irrigation, are incidentally of benefit; gauze dressings exert a suction on the wound surfaces and thus reinforce irrigation. Any wound over eight hours old is regarded as already infected. Wounds which have failed to unite and so become known technically as granulating surfaces may be treated by ointments. In other words, from military experience, it was learned that the best treatment of wounds is one which encourages the tissues to fight their own battles. The Carrel-Dakin treatment of wounds by irrigation with a weak sodium hyposulphite irrigation should be one of the best resources for this purpose, although it does not seem to be adapted to cases in which crippling is threatened, for under such circumstances immobilization is desirable, and this can hardly be obtained if the dressings have to be changed frequently.

WRANGEL, *vrang'el*, PETER NICHOLATVITCH (1879-1928). A Russian general, born at St. Petersburg, the oldest son of a Baltic nobleman of Swedish descent. He finished a brilliant academic career at the Mining Institute of St. Petersburg but later entered the army as a private soldier, and rose until in 1915 he commanded a Cossack Regiment and later a Cossack Division. From its beginning, he resisted the Bolshevik Revolution. With a volunteer army operating in the Crimea, he severely defeated the Soviet forces, and when finally overwhelmed by superior numbers in 1920, he managed to retreat in good order. After the collapse of the counter-revolution, General Wrangel and a remnant of his men found refuge in Yugoslavia, where he established his headquarters in 1922. By 1926 he gave up active opposition to the Soviet régime, and became a mining engineer in Belgium, where he died. In compliance with his dying wish, his body was removed from Brussels to Belgrade and reburied there Oct. 6, 1929, with elaborate ceremonies, which were attended by Russian émigrés from all parts of Europe.

WRANGEL, *räng'el*, ISLAND. Named after the Russian explorer, Ferdinand von Wrangel, this island is located some 80 miles from the Siberian coast at 71° north latitude and 180° west longitude. Difficult of access due to the surrounding ice pack and possessing no natural resources except its strategic position, Wrangel Island has been a bone of political contention. Sighted from a distance by Captain Kellett in 1849 and in 1867 by the American, Captain Long, who named it Wrangel Island, it was be-

lieved to extend across the Arctic until the *Jeanette* under De Long drifted just to the north of it. Men from the *Corwin* and the *Rodgers* of the *Jeannette* Search Expedition landed and mapped the island in 1881. In 1914 the *Karluk* of Stefansson's Canadian Arctic Expedition was crushed by the ice and her crew occupied Wrangel Island until rescued. In 1916 Russia announced her claim to the island. In order to reestablish British occupation, Stefansson in 1921 sent a private expedition of four men and one Eskimo to the island. Ice conditions prevented relief in 1922 and in 1923 the visiting ship found only the Eskimo woman alive. An American group under Wells was then left there whence they were forcibly removed by a Soviet Expedition in 1924. In 1926 a number of Chukchee families from Northern Siberia and three Soviet officials were placed on the island. Efforts to reach them with supplies in 1928 proved unavailing because of ice conditions.

WRESTLING. Professional wrestling, formerly fairly popular in the United States, appears now to have but little appeal to the sport-loving public. Some of the smaller cities in the Middle West evince some interest when their local favorites compete on the mat, but in the larger centres, the attendance at the few matches held is small. The dethronement of Ed "Strangler" Lewis as world champion in 1928 by Gus Sonnenberg, a product of the Dartmouth College wrestling team, is the only significant event in the recent history of the mat game. Amateur wrestling, in direct contrast to the professional sport, seems to be steadily gaining in popularity. Intercollegiate tournaments are held annually and the Y M C A's and other organizations pay considerable attention to this sport.

WRIGHT, SIR ALMROTH (1861-). A British physician (see Vol. XXIII). During the World War, Wright was consulting physician to the Allied Armies in matters relating to infection, preventive vaccination, etc. In 1915 appeared his monograph, *Wound Infection*. In collaboration with Colebrook, he published *Technique of the Treat and Capillary Glass Tube* (1921).

WRIGHT, JOSEPH (1855-). A British philologist (see Vol. XXIII). He was professor of comparative philology at Oxford until 1925, when he became professor emeritus. His later publications include *Elementary Old English Grammar* (1923), *Elementary Middle English Grammar* (1923, 2d ed., 1928), and *Elementary Historical New English Grammar* (1924).

WRIGHT, J(OSHUA) BITLER (1877-). An American diplomat. He was born at Irvington-on-Hudson, N. Y., and graduated from Princeton in 1899. After engaging in banking in New York City for six years and in farming and stock raising in Wyoming for two years, he entered the diplomatic service in 1909. While secretary of the American Legation at Brussels, Belgium, in 1913, he served as secretary to the American delegation to the Opium Conference at The Hague. During the next two years, he was secretary to the Embassy at Rio de Janeiro. In 1915 he was assigned as acting chief of the Division of Latin-American Affairs in the State Department. He served as counselor to the Embassy at Petrograd, (Leningrad) 1916 and held a similar position at the London Embassy (1918-21). In 1921 he was an expert assistant to the American Commissioners at the Washington Conference on the Limitation of Armament. He was United States

Commissioner to the Brazilian Centennial Exposition in 1922; secretary of the United States delegation to the Fifth Pan-American Conference at Santiago, Chile, in 1923; third Assistant Secretary of State (1923-24), and Assistant Secretary of State (1924-27). Since 1927 he has been Minister to Hungary.

WRIGHT, ORVILLE (1871-). An American inventor and aeronautical engineer (see VOL. XXIII). He won the Elliot Cresson Medal of Franklin Institute (1914), the John Fritz Medal, the bronze medal of the International Peace Society (1920), the John Scott Medal (1925) and the Washington Award (1927). He was appointed chairman of the contest committee of the National Aeronautic Association, succeeding Col. F. P. Lahm, in 1924. He was made an officer of the Legion of Honor in 1924. On Dec. 17, 1928, the anniversary of the first flight of a heavier-than-air machine was observed at Kitty Hawk, N. C. A commemorative tablet was placed there, recording the achievement of Orville and Wilbur Wright.

WU, CHAO-CHI (1887-). A Chinese diplomat, who was born in Hsinhui, Kwangtung, the son of Dr. Wu Ting-fang, and educated in the public schools of Washington, D. C., where his father was Minister, and in Atlantic City, N. J., and at the University of London (LL.B., 1911). He entered upon his public career in 1912 as commissioner of foreign affairs for Hupoh Province and in 1913 served as a member of both the newly established Chinese Parliament and the committee appointed to draft a constitution. Becoming counselor to the Ministry of Foreign Affairs and the cabinet in 1915, he resigned in 1917 and joined the Canton constitutional government as Vice Minister of Foreign Affairs. In 1919 he represented the Canton government at the Paris Peace Conference, in 1924 he was Minister of Foreign Affairs in Sun Yat-sen's Canton government, and upon the establishment of the Nationalist government in 1925, he became a member of the Government and Military Councils, chairman of the Council of Judicial Administration, and Mayor of Canton. Elected to the Central Executive Committee of the Kuomintang in 1926, he shortly afterward severed his connections with the Canton government because of its relations with the Communists, and in 1927 he was appointed Foreign Minister of the Nationalist government at Nanking. He resigned in 1928 and went on a special mission to the United States, to which country he was named Minister in the same year. In 1929 he also represented China at the sessions of the League of Nations.

WUNDT, WILHELM (1832-1920). A leading German philosopher and psychologist of the last generation (see VOL. XXIII). During his last years, he terminated his 10-volume *Volkerpsychologie* (1901-20). During the World War, he used his pen to defend his fatherland against what he considered the unjust accusations of Western writers. He wrote a number of articles, notably in *Scientia*, and also a volume in which he dissected the national psychologies of the warring groups (*Die Nationen und ihre Philosophie, ein Kapitel zum Weltkrieg* (1915). Wundt's death was internationally mourned. In the United States, a large group of psychologists who had been trained in his Leipzig laboratory published testimonials in honor of their master.

WURTEMBERG, *Württemberg*. A constituent republic of the German Reich in southwestern Germany, lying between Baden and

Bavaria. It has an area of 7530 square miles and a population (1925 census) of 2,580,235. Stuttgart is the principal city. With its suburbs, it had a population of 341,967 in 1925. Other cities, with their 1925 populations, are Ulm, 59,357; Heilbronn, 45,520; Esslingen, 40,562; Reutlingen, 30,501; and Ludwigsburg, 30,023. Primarily an agricultural state, Württemberg has 3,023,357 acres, or 64 per cent of the entire area, under cultivation, and 1,058,755 acres, or 31 per cent, under forest. The principal crops, with the 1927 yield in metric tons, are wheat, 104,876; rye, 25,572; barley, 131,114; spelt, 66,595; oats, 122,367; potatoes, 820,854; hay, 2,793,855; hops, 886. Wine production was 1,964,006 gallons (1927); beer, 53,323,798 gallons in 1926.

There were 2212 schools for middle and elementary education which were attended by 269,537 pupils in 1926-27, 199 boys' higher schools with 8346 pupils, 112 modern schools with 18,377 pupils, and 24 high schools for girls with 6930 pupils. There are also technical and agricultural high schools and Tübingen University. The state expenditure for education in 1928 was 51,158,655 marks. For the fiscal year ending Mar. 31, 1928, revenues were estimated at 150,008,004 marks and expenditures at 157,945,665 marks; for 1928-29 at 150,000,000 marks and 157,900,000 marks, respectively. The public debt on Apr. 1, 1928, was 1,600,100 Reichmarks.

Württemberg became a republic Nov. 11, 1918, following the abdication of King William II. A constitution adopted Sept. 25, 1919, vests the supreme power in the Landtag of 80 members elected by universal suffrage for four years. The Landtag appoints the State Ministry. The head of the ministry bears the title of State President. The composition of the Diet elected May 20, 1928, follows: Right, 20; Centre, 17; Social Democrats, 22; Communists, 6; Democrats, 8; Volkspartei, 4; Christlicher Volksdienst, 3. Due to the existence of a large middle class and the state's democratic traditions, the bourgeois parties have largely controlled the government since 1919 and Württemberg has been comparatively free from violent political disturbances. For this reason, the Republican government of the Reich sought refuge there during the Kapp Putsch in March, 1920. The constitution provides for dissolution of the Diet by popular referendum, the formation of a new ministry after each election of the Diet, and the attachment to the ministry of councils representing the various classes of the population. The Minister President appoints the members of the cabinet in conformity with the wishes of the Diet, but the administration of the state is conducted individually by the ministers. See GERMANY.

WYETH, GEORGE AUSTIN (1877-). An American surgeon, born in St. Louis, who has become well known through his introduction into operative surgery of the electric knife as a substitute for the ordinary cutting instrument. The method is also known as endothermic or electrothermic surgery. He received his degree in arts from Vanderbilt University and in medicine from the University of Pennsylvania, and after taking post-graduate courses in Europe, he settled in New York, publishing his first results on the new method in 1921 and his monograph, *Surgery of Neoplastic Diseases by Electrothermic Methods* in 1926. Although the method was devised primarily for the removal of accessible cancer, it doubtless has a much broader future.

WYLLIE, ELINOR HOYT (Mrs. **WILLIAM ROSE BENÉT**) (1886-1928). An American poet and novelist, who was born at Rosemont, Pa., and attended private schools. She married William Rose Benét in 1923, after having divorced her first husband, Horace Wylie. After 1919 she lived in New York, contributing literary reviews to magazines and for a time serving as an associate editor of *Vanity Fair*. Her first book of poems, *Nets to Catch the Wind* (1921), won the Julia Ellsworth Ford Prize. Her other books of verse were *Black Amour* (1923); *Trivial Breath* (1928); and a posthumous volume, *Angels and Earthly Creatures* (1929). She also wrote four novels that were well received: *Jennifer Lorn* (1923), *The Venetian Glass Nephew* (1925); *The Orphan Angel* (1927); and *Mr. Hodge and Mr. Hazard* (1928).

WYNN, ED (WARD) LEOPOLD (1886-). An American comedian, born at Philadelphia. He ran away from home at 15 and went into vaudeville. During 1914-15 he acted in Ziegfeld's *Follies* and in the next year appeared at the Winter Garden in New York City. He wrote music, lyrics, and book of the *Ed Wynn Carnival* (1919), *The Perfect Fool* (1921); *The Grab Bag* (1924). In 1927 it was announced that he would enter the moving-picture field.

WYOMING. The eighth State in size (97,914 square miles) and the forty-seventh in population; capital, Cheyenne. The population increased from 145,965 in 1910 to 194,402 in 1920, or by 33.2 per cent. In 1925 it was 206,381, by State census. The estimated population, 1928, was 247,000. The white population increased from 145,965 in 1910 to 194,402 in 1920, the number of Indians decreased from 1486 to 1343, and of Negroes, from 2235 to 1375. The native white population rose from 113,200 to 164,891; the foreign-born white fell from 27,118 to 25,255. Both urban and rural populations mounted, the former from 43,221 to 57,348; the latter from 102,744 to 137,054. There are only two important cities in the State, Cheyenne and Casper. The former increased from 11,320 in 1910 to 13,829 in 1920, and the latter from 2639 to 11,447.

Agriculture. Wyoming has experienced an increase in agricultural activities in recent years. The number of farms increased 43.3 per cent, or from 10,987 in 1910 to 15,748 in 1920; it dropped slightly to 15,512 in 1925. The acreage in farms increased 38.2 per cent, from 8,543,010 in 1910 to 11,809,351 in 1920, and rose still farther to 18,663,308 in 1925. The improved land in farms totaled 2,102,005 acres in 1920. The percentage of the total land area used for agricultural purposes increased from 13.7 in 1910 to 18.9 in 1920, and 29.9 in 1925. The total value of farm property doubled, \$167,189,081 in 1910, it rose to \$334,410,590 in 1920, but shrank to \$240,396,413 in 1925, the average value per farm was \$15,217 in 1910, \$21,235 in 1920, and \$15,497 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 12,545 were operated by owners, 191, by managers, and 2776, by tenants. The corresponding figures for 1910 were 9779, 311, and 897. White farmers in 1910 numbered 15,579; 13,306 were native and 2273, foreign born. There were 169 colored farmers, of whom 134 were Indians. In 1910 the white farmers numbered 10,922 (9019 were native and 1903, foreign born); and in that year, 44 of the 65 colored farmers were Indians. Farms reported as under mort-

gage, 5513 in 1920, numbered 6088 in 1925. The acreage under irrigation increased from 1,133,302 in 1909 to 1,207,982 in 1919. The number of dairy cows was 41,615 in 1920; 32,882 in 1925; "beef" cows, numbered 307,189 in 1920; 313,143 in 1925; sheep, 826,565 in 1920; 2,507,912 in 1925. The estimated production of principal farm crops in 1928 was as follows: Corn, 3,000,000 bushels, wheat, 4,098,000; oats, 4,092,000, barley, 2,310,000; potatoes, 2,352,000; and hay, 1,645,000 tons. Comparative figures for 1913 are corn, 493,000 bushels; wheat, 2,250,000; oats, 8,360,000, barley, 396,000; potatoes, 1,680,000, and hay, 912,000 tons.

Mining. Wyoming has very valuable mineral resources which have not yet been fully developed. The most important products in point of value are petroleum, coal, natural gas, and natural-gas gasoline. The growth of the petroleum industry since 1914 is indicated by the following production figures: 1914, 3,560,375 barrels, 1916, 6,234,137, 1917, 8,978,680; 1918, 12,596,287; 1920, 16,831,000; 1921, 19,332,800; 1922, 26,715,000, 1926, 25,776,000, 1927, 21,307,000; 1928, 21,461,000. The output of coal was fairly maintained, in 1914 it was 6,475,293 net tons, 1916, 7,910,647; 1917, 8,575,619; 1918, 9,438,688, 1920, 9,630,271, 1921, 7,200,606, 1922, 5,971,724, 1926, 6,512,288; 1928, 6,571,683. The State produced also a large amount of natural-gas gasoline in 1920, 8,711,037; 1926, 40,625,000 gallons. Among other mineral products are gypsum, iron ore, sand and gravel, and stone. The total value of the mineral production in 1926 was \$78,988,066, compared with \$83,034,397 in 1920; \$41,097,209 in 1919, \$42,595,812 in 1918, and \$12,417,753 in 1914.

Finance. State expenditures in the year ending Sept. 30, 1927, as reported by the U. S. Department of Commerce, were for maintenance and operation of departments, \$5,406,591 (of which \$2,238,532 was for local education), interest on debt, \$142,360, permanent improvements, \$2,152,488, total, \$7,701,439 (of which \$2,432,313 was for highways, \$760,226 being for maintenance and \$1,672,087 for construction). Revenues were \$8,823,564, of this, property and special taxes formed 17.7 per cent; departmental earnings, 4.3 per cent, and receipts from licenses 14.6 per cent. Assessed property valuation was \$461,685,564, State taxation thereon, \$1,970,843. Net State debt on Sept. 30, 1927, was \$1,612,833.

Education. The immense area and largely rural population of Wyoming bring with them the educational problems associated with these conditions. Recent educational development has had particular reference to such problems. In 1913 the Superintendent of Education was directed to prepare a course of study for the elementary schools. In 1915 a law was passed requiring physical examination of school children. The State Institute was established; and a law was enacted providing for a school code committee to arrange for a survey by the Federal Bureau of Education. The report of this survey was rendered in 1916. In the following year, the Legislature adopted a school code, providing for the State Board of Education, and greatly enlarging the duties and powers of the department, this code was amended in 1918. A director of special classes devoted special attention to the elementary, rural, and high schools of the State and examined children, conducted mental surveys, and reorganized rural schools.

The director of vocational education had general charge of this work. The efforts of the Department of Education was centred in later years largely on the rural schools. In July, 1918, a movement was launched for so-called standard rural schools; this resulted in greatly improved conditions. In secondary education, the Department of Education aimed at the maintenance of accredited four-year high schools wherever the number of students and the financial support available made it possible. In 1922 there were 38 such schools. Vocational education, including courses in agriculture, industrial occupations, and home economics, was carried on with success in spite of great difficulties. It was the desire of the Department of Education to extend vocational education to every young person desiring to enter agriculture, business, or home-making without university training. Work also was being carried on under the Federal Vocational Rehabilitation Law of 1920; a State enactment provided cooperation. The total enrollment in all the schools of the State in 1912 was 26,502. In 1925-26, 50,138. The high-school enrollment in the latter year was 9664. Expenditure for public day schools in 1925-26 was current, \$5,337,027, outlays, \$1,501,226. Illiteracy in the State decreased from 38 per cent in 1910 to 2.5 in 1920. In the native white population, it remained at 0.4 per cent, among the foreign-born, it decreased from 9.5 to 9.2 per cent; among the Negro it increased from 5.3 per cent to 6.1.

Political and Other Events. In 1914 the Democratic candidate for governor, John B. Kendrick, was elected. In 1916 Governor Kendrick, Democratic nominee, was elected to the Senate. For president, Wilson received 28,316 votes; Hughes 21,698. The Republicans, in 1918, elected Robert D. Carey governor, Senator Warren, Republican, was reelected. In 1920 Harding received 35,091 votes for President; Cox, 17,429. The Democrats in 1922 elected W. B. Ross governor. Senator Kendrick was reelected. The leasing of oil reserves in the Teapot Dome Naval Reserve to H. F. Sinclair, by Albert E. Fall,

Secretary of the Interior, in 1922, gave rise in 1924 to investigations and prosecutions of nation-wide bearing, extending over several years. For President, in 1924 Coolidge received 41,858 votes; LaFollette, 25,175; Davis, 12,868. Nellie Tayloe Ross, widow of Governor Ross who had died in office, was elected governor of the State in 1924, and continued his policies. In 1928 Hoover received 54,748 votes for President; Smith, 29,299. Frank C. Emerson, Republican, was elected governor in 1926.

Legislation. In 1917 the Legislature amended the laws relating to elections. The Legislature in 1919 passed a measure providing for a budget and made provisions for the eight-hour day on public work. In 1921 the Legislature created the State Farm Board and the State Game Commission. It authorized the Board of Education to promote Americanism. Measures passed in 1923 aimed to extend the taxing power of the State to mineral, oil, and natural-gas mines. Activities relating to agriculture were placed under a department. The hours of labor for women were limited, and child-labor laws were amended. The inheritance-tax law was altered in 1925.

WYOMING, UNIVERSITY OF. A State institution of higher education at Laramie, Wyo., founded in 1886. The student enrollment increased from 508 in 1914 to 1176 in 1928, the faculty from 66 to 108 in the same period; the library from 35,000 to 70,000 volumes, and the income from \$192,534 to \$971,657. In 1917 the music department building and a small model country school were built. In 1921 additional dormitory facilities for women students were provided by the completion of Hoyt Hall. A central heating plant on the campus also was completed in that year. In 1923 a \$200,000 library was opened and in 1925 a \$500,000 gymnasium-armory. In the following year, an engineering building was completed and in 1928 a residence hall for men was first occupied. President, Arthur Griswold Crane, Ph.D.

X-RAYS. See PHYSICS.

Y

YACHTING. The United States, Great Britain, and the Scandinavian countries are the nations that display the greatest enthusiasm for yachting. International competition has been afforded chiefly by boats of the six-meter class since 1920, the year the last races for the famous America's Cup were held. In the International Gold Cup Races of 1928, the *Fegaro* of Norway defeated the *Salema* of the United States, while in another contest for six-meter boats, England won with 83 points as against a total of 59 for the United States. A race across the Atlantic from New York Harbor to Santander, Spain, for trophies offered by the King of Spain, attracted an entry of 12 yachts in two divisions. The *Elena*, a schooner owned by William B. Bell, led the first division fleet, covering the 3055 miles in 17 days. The *Nina* won in the second division, her time being 24 days.

Motor-boat and long-distance outboard racing are gaining much attention in the United States. In 1928 Gar Wood's *Miss America VII* set a new world record for motor boats by averaging 92.8 statute miles an hour.

YAKUTSK AUTONOMOUS SOCIALIST SOVIET REPUBLIC. See SIBERIA.

YALE UNIVERSITY. A nonsectarian institution of higher learning at New Haven, Conn., founded in 1701. Student enrollment increased from 3289 in 1914 to 5743 in 1928. During the same period, the faculty increased from 160 to 1186, the library from 1,000,000 to 1,901,512 volumes and pamphlets, and productive funds from \$15,379,363 to \$58,024,459.36. In this period, many reorganizations in administration were adopted. All graduate work not given under the professional schools was concentrated in the graduate school under four groups of faculties. A common freshman year for both the college and Sheffield Scientific School was established in 1920 under a special dean and faculty, and the Sheffield course was lengthened from three to four years and became purely scientific. Building operations carried on during this period included the Harkness Memorial Quadrangle of dormitories for upper classmen, which covers an entire city block, given by Mrs. Stephen V. Harkness in memory of her son. The Sterling Chemistry Laboratory (\$2,000,000) and the Sterling Hall of Medicine (\$1,500,000) were completed in 1922 and 1923. These buildings were erected with part of the large trust fund left by John W. Sterling in 1919 to be used for building, scholarships, fellowships, and lecturerships, and for the endowment of professorships, and the establishment of special funds for prizes. Sage Hall, containing offices and lecture rooms for the school of forestry, was opened in 1923 and the Lapham Field House in 1924. In that year a gift from Edward S. Harkness provided for the building of a university theatre and the establishment of a department of the drama in the school of fine arts. Professor George Pierce Baker, formerly

of Harvard, was appointed to the chair of the history and technique of the drama and director of the theatre.

The Peabody Museum was dedicated late in 1925 and Edwin McClellan Hall, a dormitory, was opened for residence. An 18-hole golf course was laid out to occupy 120 acres of the Ray Tompkins Memorial, which comprises 700 acres to be developed for athletic uses, and the Carnegie Corporation appropriated \$1,500,000 for added facilities in the history of arts in the school of fine arts. In 1926 the law school raised entrance requirements, admitting from another law school only those who had attained a B average, and introducing a system of honors courses. Construction of an art museum was begun through a gift of \$1,000,000 from two anonymous donors, and the trustees of the Sterling estate provided funds for the erection of the Sterling Memorial Library to contain eventually 5,000,000 volumes with accommodations for special collections and seminars. Construction of the William L. Harkness Educational Building and of Charles W. Bingham Hall, a dormitory, was begun. A colonnade with an altar of liberty in the centre, a memorial to Yale men who lost their lives in the World War, was provided by gifts from alumni.

In 1926 the school of medicine instituted changes compatible with graduate education and designed to increase the student latitude of choice and opportunity to study in selected fields, abolishing the year system with its resultant division of the student body into classes. Buildings for the summer engineering courses of the Sheffield Scientific School at East Lyme, Conn., were completed in 1927. Athletic facilities were augmented by gift of funds for the Phipps Polo Field and for the Charles E. Coxé Memorial (Yale Field Gymnasium). Additional laboratory facilities were made available for the medical school in 1928 by the completion of the Brady Memorial Laboratory, Lauder Hall, and Farnam Memorial Building in the grounds of the New Haven Hospital. The Walter Camp Memorial Gateway was dedicated in 1928. In the autumn of 1929, work was begun on the new building for the Institute of Human Relations to cost \$2,000,000. It was planned to be a part of the Human Welfare Group in which the university aims to study man from the mental, social, and physical standpoints with a view to correlating scientific knowledge in these fields. President James Rowland Angell, Ph.D., Litt.D., LL.D.

YAMAMOTO, COUNT GOMBEI (1852-). A Japanese naval officer and statesman, of the Satsuma clan. By 1896 he was a vice admiral, and he became a full admiral in 1904, when he was Minister of the Navy (1898-1906). In 1913-14 he was Premier, resigning because of naval scandals, and again in 1923, when the first cabinet meeting took place in the open air, in the midst of the smoking ruins made by the earthquake of September 1, and the new Government had to take immediate measures to relieve the unprecedented situation. On Dec. 29, 1923,

YALE UNIVERSITY

BRANFORD COURT, MEMORIAL QUADRANGLE, SHOWING THE HARKNESS MEMORIAL TOWER

Yamamoto and his cabinet resigned because of an attempt on the life of Prince Hirohito. He was created a baron in 1902, a count in 1907, and was made a Knight Grand Cross of St. Michael and St. George by Great Britain.

YAP (yap) ISLAND. One of the Caroline group of islands, situated in the Pacific north of the Equator, and before the World War belonging to Germany, but since 1919 under a Japanese mandate. In 1916, by a secret agreement with Great Britain, Japan laid claim, in the event of Germany's defeat, to all of Germany's islands north of the Equator, while recognizing the British claims to those south of it. On this basis, the Supreme Council on May 7, 1919, allocated the islands north of the Equator, including Yap, to Japan as mandatory Power, although not without President Wilson's disapproval. The American interest was plain. Yap was nearer the Philippines than any other of the islands, it was, too, an integral point in the American system of communications in the Pacific, for here were to be found stations of the Pacific cable of the Commercial Cable Company from Hawaii, of an American-British cable extending north to the Bonin Islands, and of British lines to the Chinese coast, as well as a wireless station. During 1920-21, the American point of view was repeatedly stressed, to the discomfiture of Japan and Great Britain and to the greater straining of the bonds of the Allied unity. The American contentions centred in the facts that the United States government had served notice during the Peace Conference that it reserved the right to object to exclusive Japanese control of the cable landings, that as the German islands had been ceded to the Allies by the Peace Conference their disposition was a concern of the United States, and that in view of the property interests of other nations, Yap, so far as it was a cable landing station, ought to be internationalized. The Japanese insisted that Yap was theirs by the edict of the Supreme Council and that therefore the administration of the island was then exclusive concern. On Feb. 21, 1921, the American government dispatched to the Council of the League of Nations a note outlining its position and requesting a reopening of the question. On March 2, the Council admitted the claims of the United States but declared its inability to act, on the ground of the previous decision of the Supreme Council. This, too, represented the opinion of Great Britain and France. The solution of the difficulty rested on the meeting of the Washington Conference. On Dec. 12, 1921, finally, representatives of Japan and the United States signed an agreement by which the Japanese mandate was recognized by the United States. Japan, on the other hand, accorded the United States free access, on an equal footing with Japanese and other nationals, to the present cable between Yap and Guam and to any other cables which might be laid by Americans, the right to use the Japanese wireless service, and in case of suspension of this right, to build American stations, and freedom of entry and exit for persons and property. On Mar. 1, 1922, the United States Senate ratified the treaty affecting Yap, and the matter was formally closed. The island has a population of 7418, including 7230 natives, 171 Japanese, and 17 foreigners. See JAPAN; WASHINGTON CONFERENCE.

YEATS, JAMES, WILLIAM BUTLER (1865-)
An Irish writer (see VOL XXIII), recipient of the Nobel Prize for Literature (1923) and a Senator of the Irish Free State since 1922. He

was a fervid Nationalist and wrote much tropical verse, as well as *Responsibilities* (1914) and *Reveries over Childhood and Youth* (1916). In his poetry, he tried to carry out Synge's idea of the poet as one who "uses the whole of his personal life as his material." His poems are therefore very imaginative and individual. *The Wild Swans of Coole* (1919) reveals his interest in esoteric doctrine. *Michael Robartes and the Dancer* (1921) deals with the Ireland of 1916. He was one of the first in England to appreciate the poems of Rabindranath Tagore. Another Oriental preoccupation was the Noh drama of Japan. Under Japanese influence, he wrote *At the Hawk's Well* (1917) and *Two Plays for Dancers* (1919). He was deeply interested in the little theatre movement in Dublin, and worked for an aristocratic theatre for a small audience modeled somewhat on the Noh drama of Japan. Other later works were *Per Amara Silentia Lamer* (1918), *The Cutting of an Agate* (1919), *Seven Poems and a Fragment*; *Later Poems* (1923), *Essays* (1924); *A Vision* (1926); *Estimation, being some Fifty Thoughts from a Diary of 1909* (1926), *The Pot of Broth* (1926) and *Resurrection* (1927), plays, *October Blast* (1927) and *The Tower* (1928), poems; and Sophocles' *King Oedipus* (1928). In 1923 the publication of a new edition of his works was begun. Consult *William Butler Yeats, The Poet of Contemporary Ireland*, by J. M. Hone (1915), and *The Early Poetry of William Butler Yeats*, by Patty Gird (1916).

YELLOW FEVER. Knowledge of this affection seemed for awhile greatly to have advanced. In 1918 the foci of the disease were limited to Ecuador and Guatemala. The outbreak in Guatemala was serious, with 550 cases and 200 deaths, but the disease was soon stamped out by the local health authorities in cooperation with the U. S. Public Health Service. At the same time, the Rockefeller Foundation sent Dr. Noguchi to study the cases of the disease at Guayaquil in Ecuador. In 1917 this was the only active focus of the disease in the entire world, prior to the Central American outbreak. In 1920 the Rockefeller Foundation formally announced that Dr. Noguchi's discovery of the exciting cause of the disease, a spirochete, the *Laptozpora icteroides*, had led to the preparation of a preventive and curative serum. Already, people going into yellow fever districts were being immunized in the Broad Street Hospital in New York City. The disease was stamped out in South America, and in 1919 the world was for a time entirely free from it. In 1920 it broke out anew in Yucatan, and Dr. Noguchi was sent to the infected area. Several shipments of the Rockefeller vaccine also were forwarded. Specimens of the spirillum culture were sent from Yucatan to Havana for study, and it was ascertained that the dog can be inoculated with a disease which closely resembles human yellow fever. In 1921 Dr. Howard Cross, who was to have taken charge of the bacteriological laboratory at Vera Cruz, fell a victim to the disease.

During the brief space of two years, however, our views of the nature of this affection, themselves so recent, have had to recede in favor of others which differ radically. Although the disease in meridional America had apparently been conquered for the time, largely through the efforts of Noguchi who had seemingly discovered the cause and devised a technique for immunization, it reappeared in 1926 in its original homestead,

the West Coast of Africa, from Senegal to the Gold Coast. The Rockefeller Commission dispatched Prof. Adrian Stokes to Lagos and, after he had succumbed to the disease, Noguchi himself followed and met the same fate. Other scientist martyrs followed, and it is now regarded as too hazardous to study this disease in its native habitat. It can be conveyed to monkeys and the preserved infected organs of these animals are being studied in the temperate zone. A large body of data has been accumulated which tends to show that the disease is due to a filter-passing virus and not to any visible organism (the original belief before Noguchi's supposed discovery). For the time being, through the coöperation of the Rockefeller Commission and the local governments in French and British territory, the disease has been brought to arrest. It is unfortunate that Noguchi did not survive to adjust his results in the Western Hemisphere with those in Africa.

YEMEN. See ARABIA.

YERKES, ROBERT MEARNS (1876-). An American experimental psychologist (see VOL. XXIII). He was the organizer of the psychological tests for the U. S. Army during the World War. In 1915 he had prepared a point scale for mental ability, and it was this scale, rather than the Binet mental age tests, which was found practicable for the stupendous task of cataloguing the abilities of more than 1,000,000 men. Major Yerkes edited the publication of the test results under the titles, *Army Mental Tests* (1920) and *Psychological Examining in the United States Army* (1921). He also edited a volume on *The War and Science* (1920). He was chairman of the Research Information Service of the National Research Council (1919-24). Since 1924 he has been professor in the Yale Institute of Psychology. He was coauthor of *Chimpanzee Intelligence and Its Vocal Expressions* (1925), and author of *Almost Human* (1925) and *The Mind of a Gorilla* (1927). He is editor of the *Journal of Comparative Psychology*. See MENTAL MEASUREMENT.

YESHIVA COLLEGE. The first college of liberal arts and science in the United States under Jewish auspices. It is for men only and aims to afford its students a harmonious combination of secular and Jewish studies, a union of the culture and faith of Israel's age-old heritage with the culture and knowledge of the present-day world. The Rabbi Isaac Elchanan Theological Seminary (the Yeshiva) was chartered in New York, in 1896, and later absorbed the Etz Chaim Talmudic Academy, the oldest Jewish day school in the United States, chartered in 1886; and by amendment to the charter, in 1928, the Yeshiva became known as the Rabbi Isaac Elchanan Theological Seminary and Yeshiva College, and was authorized to offer courses leading to the baccalaureate degree. The freshman year of the college began its work in the autumn of 1928, with an enrollment as follows: Senior seminary, 142, junior seminary, 235, teachers' institute, 135, college (freshman year), 31. The faculty numbered 31. The income for the year was \$142,000. The library contained 17,000 volumes, and a collection of manuscripts. On Dec. 9, 1928, a group of buildings, including the main building, the auditorium, and the dormitory, with accommodations for 1500 students and 200 resident students, was dedicated at Amsterdam Avenue and 186th to 188th streets, New York. The next group to be erected provided for a

new library and a museum of Jewish art and archaeology. A building campaign yielded over \$2,700,000 and additions were made to the endowment fund. President of the faculty, Bernard Revel.

YON, PIETRO ALESSANDRO (1886-). An Italian organist and composer, born at Settimo Vittone in Piedmont. At the age of six, he began his musical studies with A. Burbatti at Ivrea. In 1900 he entered the Conservatory of Milan, but winning a scholarship in the following year at the Conservatory of Turin, he continued his studies there under da Venezia (piano), Redmondi (organ), and Bolzoni (composition). He then attended for one year the Accademia Santa Cecilia in Rome, where his teachers were Bustini and Sgambati (piano), Renzi (organ), and de Sanctis (composition). He graduated in 1905 as winner of the first prize and of a medal awarded by the Minister of Public Instruction. From 1905 to 1907, he was assistant to his teacher Renzi, organist of St. Peter's, and even then his recitals began to attract attention. In 1907 he settled in New York as organist at St. Francis Xavier's, where he remained until 1927, when he accepted a call to St. Patrick's Cathedral in that city. Frequent and extensive tours of the country soon established his reputation as one of the greatest living organists. In 1921 he was honored by the appointment as honorary organist at St. Peter's in Rome. This was the first time that this distinction had been conferred. His works consist of 17 masses, *Concerto Gregoriano*, for organ and orchestra, a concerto for oboe and orchestra, brilliant organ compositions, mostly in larger forms, motets (a cappella and with organ), piano pieces, and songs.

YORK, ARCHBISHOP OF. See TEMPLE, MOST REV. WILLIAM.

YOUNG, ALLYN ABBOTT (1876-1920). An American economist, born in Kenton, Ohio, and educated at Hiram College and Wisconsin University. During 1902-06 he taught economics at Wisconsin, Western Reserve, and Dartmouth universities and then became professor of economics at Stanford. In 1911 he accepted a call to a similar chair at the University of Washington and two years later went to Cornell, where he remained until 1920, when he was called to Harvard. After 1927 he also held a professorship of political economy at the University of London. During the World War, he was director of the bureau of research of the War Trade Board and then was chief of the division of economics and statistics of the American Commission to Negotiate Peace. He was a member of the Massachusetts Commission on Pensions, 1923-24, and president of the American Economic Association, 1925. In addition to many articles and papers on economic subjects, he was one of the authors of *Outlines of Economics* (1908, 1916). Subsequently he also wrote *Economic Problems, New and Old* (1927) and *An Analysis of Banking Statistics* (1927).

YOUNG, CLARENCE MARSHALL (1889-). An American lawyer and public official, born in Colfax, Iowa, and educated at Drake University and the Yale Law School. Admitted to the Iowa bar in 1910, he practiced at Des Moines until 1917 when he joined the U. S. Army Air Service and spent 18 months in Europe, including five months as a prisoner of war in Austria. He became a major in the Air Corps Reserves. Appointed to the aeronautics branch of the U. S. Department of Commerce in 1926, he became chief

of the Division of Air Regulations in 1927, then director of aeronautics, and in September, 1929, was appointed Assistant Secretary of Commerce for Aeronautics.

YOUNG, THE RT. HON. SIR (E.) HILTON (1879-). A British authority on finance. He was educated at Eton and at Trinity College, Cambridge, and called to the Bar (Inner Temple) in 1904. Enrolling as a naval lieutenant for the World War, he served on the *Vindictive* at Zeebrugge Mole in 1918, was severely wounded, and promoted to lieutenant commander. In the Archangel campaign, he commanded an armored train, winning membership in the Distinguished Service Order. He was a Liberal member of the Parliament for Norwich in 1915-23 and after 1924. He left the Liberal and joined the Conservative Party in 1926. He served as Financial Secretary to the Treasury (1921-22), attended The Hague Conference on International Finance in 1922, was on financial missions to India (1920), Poland (1924), and Iraq (1925), and was a delegate to the Assembly of the League of Nations in 1926 and 1927. He was also a member of the Royal Commission on Indian Currency and Finance (1925) and of the East African Commission (1926). In journalism, he served an apprenticeship as assistant editor of the London *Economist*, and later became financial editor of the *Morning Post* and editor-in-chief of the *Financial News*. He is the author of *Foreign Companies and Other Corporations* (1911), *System of National Finance* (2d ed., 1924), *A Muse at Sea* (1919), and *By Sea and Land* (2d ed., 1924).

YOUNG, FRANCIS BRETT (1884-). A British novelist and poet who was educated at Epsom College and the University of Birmingham, and started his career as a doctor. He made a lecture tour of the United States in 1926 and in 1928 gave the Frances Bergen Memorial Lecture at Yale University. He was a major in the Royal Army Medical Corps during the World War, serving in German East Africa. *Marching on Tanqua* (1918) was a description of the spirit of the forest campaign there, and *The Crescent Moon* (1918) and *Five Degrees South—Poems* (1917) grew out of the same experience. His other works include: music for the *Songs of Robert Bridges* (1912); *Robert Bridges, A Critical Study* (1913); *The Dark Tower* (1914); *The Iron Age* (1916); *The Young Physician* (1919); *Poems* (1919); *Captain Swing*, a play (1919); *The Tragic Bride* (1920); *The Black Diamond* (1921); *Pilgrim's Rest* (1922); *Woodsmoke* (1924); *Sea Horses* (1925); *Portrait of Claire* (1927), which won for him the James Tait Black Memorial Award, and was published in the United States as *Love is Enough, My Brother Jonathan* (1928), and *Black Roses* (1929).

YOUNG, HUGH HAMPTON (1870-). An American surgeon and urologist, born in San Antonio, Tex. He was graduated from the University of Virginia in arts and medicine (1893), studied at Johns Hopkins (1894-95), was pathologist and resident physician at the Thomas Wilson Sanitarium (1895-98), and after specializing in urology was placed at the head of the urological department of Johns Hopkins Hospital and made clinical professor of the same branch in the college faculty. He was also made director of the J. B. Brady Urological Foundation at Johns Hopkins. During the World War, he was director of urology of the A. E. F. Dr. Young has been president of each of the two national urological

societies and of the International Congress of 1927. He founded and edits the *Journal of Urology* and recently published a standard work, *The Practice of Urology*, in 2 vols. He has contributed over 200 papers to periodical literature on urological subjects. In 1928 he published (with Waters) *Urological Radiology*.

YOUNG, JOHN WESLEY (1879-). An American mathematician, born in Columbus, Ohio, and educated at Ohio State University and at Cornell. After teaching at Cornell, Northwestern, and Princeton universities, he was head of the department of mathematics at Kansas University (1908-10) and was then called to Dartmouth, where he has since remained. Algebra and geometry have been the subjects of his special studies and he has published a number of books and many papers on these subjects. He was editor of the *Bulletin of the American Mathematical Society*.

YOUNG, LEVI EDGAR (1874-). An American lecturer and professor of history, born at Salt Lake City, Utah, and educated at Utah, Harvard, Strassburg, and Columbia universities. He was professor and head of the department of Western history at the University of Utah (since 1900). Professor Young lectured widely in American universities on the history of that State. He was a member of many historical and scientific societies and of the First Council of 70 of the Church of Jesus Christ of Latter-day Saints. He wrote *History of the Mormon Tabernacle* (1918) and *The Founding of Utah* (1923).

YOUNG, MAHONRI (MACKINTOSH) (1877-). An American sculptor and etcher, born at Salt Lake City, Utah. He is a grandson of Brigham Young. He studied at the Art Students' League, New York City, and the Julian Academy, Paris. He was for some years instructor in drawing at the Art Students' League and more recently at the American School of Sculpture. He is known chiefly for his figures of laborers, usually small in size, but depicted in an interesting and virile manner. Among his best-known works are "Man with Pick" (Metropolitan Museum, New York), Hopi and Apache groups, in the Museum of Natural History, New York, "A Laborer" and "The Rigger," Free Public Library, Newark, N. J., and the sea-gull monument in Salt Lake City. He is a National Academician (1923) and a member of the National Sculpture Society.

YOUNG, OWEN D. (1874-). An American lawyer and financier, born at Van Hornesville, N. Y., and educated at St. Lawrence University and the law school of Boston University. Beginning the practice of law in Boston in 1896, he went to New York in 1913 to become counsel for the General Electric Company and vice president in charge of policy. In 1922 he was elected chairman of the board. He also organized the Radio Corporation of America, becoming chairman of its board and a director in numerous corporations. In 1921 President Harding appointed him a member of the Conference on Unemployment and he was a member of the Second Industrial Conference (1922) and the International Distribution Conference (1924). As a member of the first Committee of Experts appointed by the Reparations Commission in 1924 to investigate the financial condition of Germany, he was credited with much of the responsibility for the Dawes Report and upon the adoption of the Dawes Plan was appointed Agent General for

YUGOSLAVIA. See JUGOSLAVIA.

YUKON, yŏŏ'kŏn A Territory of the Dominion of Canada, bordering on Alaska. Total area, 207,076 square miles. Population in 1921, 4157, and in 1929 officially estimated at 300. In 1911 it was 8512; and in 1901, during the gold boom, 27,219. Capital, Dawson City, with a population of 975 in 1921, as against 3013 in 1911. Mining is the chief occupation. In 1927-28 the gold output was valued at \$568,231. Other minerals produced in the latter year were silver, lead, and coal; copper production was not

reported after 1920. In 1928 the total mineral production was valued at \$2,683,270. In 1913 the mineral production totaled \$6,276,737 and in 1907, \$3,335,898. The fisheries continue to be of some importance. There were 21 fur farms in 1923. Fur exports for 1926-27 were valued at \$382,261. Prior to 1920, the Yukon was governed by a gold commissioner and a territorial council of 10 elected members. After that date, the membership of the council was reduced to three. The territorial revenues in 1928 were \$211,331 and expenditures, \$213,589.

Z

ZAGHLOUL, SAÏD PASHA (1856-1927). An Egyptian Premier, educated at the Mohammedan University at El Azhar. In 1884 he began to practice law, in 1906 he became an able Minister of Education, and in 1910, Minister of Justice. When his charges against Khedive Abbas Hilmy were not proved, Lord Kitchener forced him to resign (1912) and he became bitterly opposed to the British. After the Armistice in 1918, he asked for recognition of Egyptian independence by the withdrawal of the British protectorate. When he was not allowed to go to London to urge this cause, he and his friends exhibited so hostile an attitude that three of them were arrested and deported to Malta. This action aroused the country, and many were killed in the subsequent outbreaks.

Zaghoul Pasha was released after a time, and continued his propaganda from Europe. When he returned to Egypt in 1921, rioting took place and he was again arrested and deported to Ceylon. In 1922, when the British declared Egypt independent, except for certain "reserved points," Zaghoul and his followers demanded complete independence, and in the election of January, 1924, for which he was allowed to return, they received a large majority. Zaghoul was made Premier early in 1924, but after loss of prestige due to fruitless conversations with Ramsay MacDonald, the British Premier, and the assassination of Sir Lee Stack, the Sirdar, in November, 1924, he resigned. In 1926 he was again Premier for a short period, and afterward continued to direct Nationalist policy even though he held no office.

ZAHN, tsan, ERNST (1867-). A Swiss novelist (see Vol. XXIII). His later publications include *Einmal Muss wieder Friede werden!* (1916); *Stephan der Schmied* (1917; Eng. trans., 1920); *Johannes A Pro*, a war play (1919); *Schwärzer* (1920); *Lotte Esslings Wille und Weg* (1921); *Das Licht*, short stories (1922); *Die Hochzeit des Gaudens Orill* (1927); and *Brettspiel des Lebens* (1928). Consult *The Modern German Novel*, by H. W. Hewett-Thayer (1924).

ZAMIS, ALEXANDER. See GREECE.

ZANGWILL, ISRAEL (1864-1926). A British author (see Vol. XXIII). He was active as a speaker in Great Britain and Ireland, Jerusalem, Holland, and the United States. During the World War, he was a pacifist. His attempt to combine all the Jewish organizations in a plan to secure the Highlands of Angola as the Jewish national home was unsuccessful, and he later declined to work with the Zionists when the British government supported a plan to set apart Palestine for the Jews. He published *The War for the World* (1916); *The Principle of Nationalities* (1917); *Chosen Peoples* (1918); *Jenny the Carrier*, a novel (1919); a volume of essays, *The Voice of Jerusalem* (1920); *Flutter-Duck*, fiction

(1923), and *Ibn Gabriol's Poems*, from the Hebrew (1923). He also wrote the comedies *Too Much Money* (1918), *The Cockpit* (1921); *The Forcing House, or the Cockpit Continued* (1922), and *We Moderns*, a post-war comedy in three movements (allegro, andante, adagio) (1926). Consult *Israel Zangwill, a Biographical Sketch*, by Harry Schneiderman (1927).

ZANZIBAR, zan'zi-bar. A British protectorate of East Africa comprising the island of Zanzibar (640 square miles), the island of Pemba (380 square miles), and several islets. The population of the protectorate in 1924 was 216,790. By the 1921 census, there were 24,125 inhabitants not native, including 270 Europeans, 10,000 Arabs, and 12,900 British Indian subjects. Zanzibar town has 38,700 inhabitants. Cloves and copra continue the most important articles of trade. Others are rice and grain, ivory, and raw cotton, all of which entered into the transit trade. Export values in 1913, 1921, and 1927 were £1,048,366, £3,246,405, and £1,828,258. Import values for 1913, 1921, and 1927 were £1,103,348, £3,223,295, and £1,771,124. Leading articles of import are cotton piece goods, rice and grain, sugar, motor spirits, and petroleum. In 1913, 1,502,920 tons of shipping entered; in 1923, 1,602,640 tons, in 1926, 1,238,892. Of late years, the importance of Zanzibar port as a point of transshipment and as a distributing centre decreased, owing to the development of the mainland, the establishment of direct steamer communication between coast ports and Europe, and the growing importance of Aden. The local traffic was retained. Revenues increased from £275,126 in 1913 to £540,345 in 1927. For the same years, expenditures were £248,000 and £606,301. The public debt at the end of 1927 was £100,000. In July, 1913, control over the affairs of the protectorate was vested in the Colonial Office. The reigning Sultan, Seyyid Khalifa bin Harud, whose influence over the natives of East Africa was great, aided considerably in keeping the country well disposed toward Great Britain during the World War.

ZECKWER, CAMILLE (1875-1924). An American composer, born at Philadelphia. He received his early training from his father at the Philadelphia Musical Academy, then studied for two years (1893-95) under Dvorák at the National Conservatory in New York, and later under Schadowenka in Berlin. In 1915 he became director of the Germantown branch of the Philadelphia Musical Academy. In 1922 he was the first recipient of the newly established \$1000 prize awarded annually at the North Shore Festival (Evanston, Ill.). His works include a symphonic poem, *Sohrab and Rustum*; *Jade Butterflies* (North Shore Festival Prize); *Swedish Fantasy*, for violin and orchestra; a piano concerto; a piano trio, a piano quartet, a piano quintet; a string quartet; and two violin sonatas; *Sérénade Mélancolique* for violin, 'cello, and piano; *The New Day*, cantata for soli, chorus,

and orchestra; piano pieces; choruses, and songs. A three-act opera, *Jane and Janetta*, had not yet been produced in 1920.

ZEMGALS, GUSTAV (1871-). A President of Latvia, who was educated at Moscow University and entered upon a legal career in 1899. He was Lord Mayor of Riga in 1917 and 1919, vice president of the National Council which proclaimed the Latvian Republic in November, 1918, and a member of the Constitutional Assembly. He was elected President of the Republic Apr 8, 1927, for the term ending in 1930.

ZEMSTVOS, ALL-RUSSIAN UNION OF. See RUSSIA, *History*.

ZIEGFELD, FLORENZ (1869-). An American theatrical producer. He was born at Chicago, received high-school training, and at the age of twenty-three entered the theatrical business. During the World's Fair at Chicago in 1893, he brought military bands from Europe for that enterprise, and managed the Chicago Tivoli. He became manager and lessee of theatres in New York and Boston. Since 1907 he has produced *Ziegfeld's Follies*. He married Billie Burke, the actress, in 1914.

ZEPPELIN AIRSHIPS. See AERONAUTICS.

ZIMMERMANN, tsin'er-man, ARTHUR (1859-1925). A German public official, born at Frankenstein. He entered the Foreign Office in 1902 in a subordinate capacity and in 1910 was made director of the political section. In November, 1916, he became Foreign Secretary and as such attempted to incite Mexico to an attack on the United States and suggested that Mexico should be rewarded by the gift of New Mexico, Texas, and Arizona. Disclosures concerning his activities and those of Bethman-Hollweg caused the downfall of the latter, and Zimmermann was forced to retire on Aug. 5, 1917.

ZINC. Since 1914 the zinc-producing industry of the world has passed through several interesting phases. Particularly is this true of the industry in the United States, where, for a time, there was extraordinary developments in production and where most of the refinements in ore-dressing and metallurgical practice have originated. In 1870 the United States produced about 7000 tons of zinc, but by 1928 its output amounted to 583,210 tons. In that country, there are three principal kinds of zinc ores, first, the lead-zinc ores of the Missouri, Kansas, Oklahoma, and Wisconsin districts, secondly, the oxidized ores from the remarkable mine of the New Jersey Zinc Company in New Jersey, and thirdly, the complex-sulphide ores, chiefly copper zinc and silver-lead-zinc, of the Rocky Mountains. It is in this latter field that the most important new metallurgical developments have been made in recent years, for practicable methods of concentrating the ores by the selective flotation process have been worked out, and the electrolytic process for the production of high-purity zinc has been successfully applied to the zinc concentrates produced by the selective flotation process.

There were two electrolytic zinc plants in operation in the United States in 1928—that of the Anaconda Copper Mining Company, at Great Falls, Mont., and that of the Sullivan Mining Company at Kellogg, Idaho. Construction of a third plant was started in 1928 at East St. Louis, Ill., by the Evans-Wallower Lead Company. The high-purity zinc produced by the electrolytic zinc process is slowly displacing the zinc produced by the retort, or furnace, process in most of the important outlets for zinc metal.

Beginning with 1926, the zinc-producing industry in the United States entered its second period of readjustment since the World War. The first period had marked the bringing of wartime production down to a peace-time consumption basis. The second period of readjustment marked a shifting of the supply sources of zinc concentrates and zinc metal. The importance of the Missouri, Kansas, and Oklahoma production began to decline in 1926 and it appeared that further refinements in the operation of the selective flotation process of the Rocky Mountain States would mark a growing increase in importance of that section as a zinc producer. Overproduction characterized the zinc industry of the United States in 1927 and the price of zinc metal declined sharply. Zinc exports from the United States also have shown a downward trend in recent years and the domestic producer has been forced to depend more on consumption at home.

The American Zinc Institute was organized shortly after the close of the War for the purpose of popularizing the use of zinc, and of conducting research for developing new uses for the metal.

Production of zinc in Europe and in Canada has shown remarkable increases in recent years and it is this condition that has brought about the decline in exports from the United States. In 1928 there was formed the International Zinc Cartel for the purpose of preventing overproduction. The electrolytic zinc process has been adopted by several companies in Europe and it appears likely that the proportion of electrolytic zinc produced in Europe will increase at a rate corresponding to that in the United States.

Although most of the zinc produced is utilized in the manufacture of brass and in the galvanizing or coating of sheet iron and steel, nevertheless there has been a considerable increase in recent years in the manufacture of rolled and sheet zinc, and by the die-casting industry. In addition to its uses as a metal, zinc oxide is one of the most important mineral pigments and is also largely used in the production of automobile tires. Zinc chloride is used by railroad companies, for the preservation of ties, and by other consumers of timber.

AVERAGE PRIME WESTERN GRADE ZINC
PRICES AT EAST ST. LOUIS, ILL.
(From *Engineering and Mining Journal*)
(In cents per pound)

ZINGHER, ABRAHAM (1865-1927). An American physician and bacteriologist. He received his degree in medicine at Cornell University in 1908 and was later appointed professor of bacteriology and hygiene at the university and the Bellevue Medical School. He was also associated with the chair of pediatrics at the New York Post-Graduate School and Hospital and, as an attending physician, with the Willard Parker Hospital, New York, where he did notable work in 1916 during an epidemic of infantile paralysis. During the World War, he served at Base Hospital 69 in France. He worked with Schick of Vienna in perfecting anti-diphtheritic serum and was engaged in experiments on various sera when he was accidentally asphyxiated by escaping gas.

ZINOVIEV, GRIGORI OVSEI GERSHON ARON (1883-). A Russian Communist leader. In 1907 he attended the London Conference of delegates of the Russian Social Democratic Labor Party, of which he was an active member. In 1908 he served a term in prison for his revolutionary activities, but in 1909 he made his way abroad and edited *The Social Democrat*, chief organ of his party. After the revolution, Zinoviev became a member of the Leningrad Soviet and in 1918 its President. He became the first president of the Third (Communist) International and also president of the Leningrad Extraordinary Commission for combating counter-revolution. As a member of the Cheka (Central Committee), he took a leading part in the effort, begun in 1924, to obtain more freedom of judgment and action within the ranks of his party. Aligning himself with Trotsky and Kamenev in their opposition to the policies of the majority led by Joseph Stalin, secretary general of the Central Executive Committee, he was deposed as president of the Communist International, and as President of the Leningrad Soviet, and expelled from the party (1927). In December, 1927, he publicly announced that he was willing to submit unreservedly to the will of the majority and applied for reinstatement. He was placed on probation for six months and then readmitted.

ZINOVIEV LETTER. See RUSSIA, under HISTORY, also GREAT BRITAIN.

ZIONISM. The outbreak of the World War ended the gradual influx of Jewish settlers into Palestine and cut off the funds which had enabled them to maintain themselves and their institutions. The Jewish population, which had reached 100,000 in 1914, began gradually to diminish because of emigration. A Provisional Committee for Zionist affairs was hurriedly organized in America, under the chairmanship of Louis D. Brandeis, to prevent the disintegration of the settlements already made in Palestine and to assist the settlers until the ending of hostilities. In the meantime, an intensive propaganda was instituted among American Jews in the effort to raise sufficient funds to compensate for the complete breakdown of the Zionist organization in Europe. In 1916 conversations began between the leaders of the Zionist organization, headed by Dr. Chaim Weizmann, a Russian-born Jew, who had attained a position of prominence in the University of Manchester (England), and the leaders of the British government, relative to the creation of an autonomous Jewish settlement in Palestine. Actuated by the double motive of winning the united sympathies of the Jews for the Allied cause and the creation of a friendly population in Palestine, which borders on the Suez Canal,

Lord Arthur Balfour, in November, 1917, declared that the British government looked with favor upon the restoration of Palestine as the Jewish national homeland. A special Jewish battalion was organized, under the leadership of Col. John H. Patterson, to assist in the reconquest of the Holy Land. A Zionist commission was sent to assist the British authorities in the administration of the Jewish homeland. In the meantime, preparations were begun for creating a large Jewish university on Mt. Scopus, where the language of instruction was to be Hebrew, which had been revived by the incoming settlers.

In 1920 in London, the first Zionist Congress after the War was held. Plans were drawn up for the reorganization of the Jews of the world for work in Palestine and for the raising of a fund, called the Keren Hayesod, to begin the work of financing the new settlements. The Balfour Declaration, originally an enunciation of the policy of Great Britain only, was ratified by the Allied statesmen at the Conference of San Remo and in 1922 by the League of Nations. These two decisions marked the stabilization of the Zionist political position and the beginning of a period of intense activity. In the summer of 1921, Sir Herbert Samuel, an English Jew of Zionist sympathies, was appointed by the Lloyd George government to the position of High Commissioner of Palestine with the responsibility of maintaining the rights of the various contending parties. Jewish immigrants, chiefly from eastern Europe, at the rate of 1000 a month were beginning to enter the country; they were financed by the World Zionist Organization. In the meantime, a break occurred between the adherents of Judge Louis D. Brandeis, in America, and those of Dr. Weizmann. The official organization, however, remained under control of the international leaders.

Following the War, the political history of Zionism was stormy. Two efforts were made to overturn the administration of Louis Lipsky, who had succeeded Brandeis as the president of the Zionist Organization of America. At the 1927 annual meeting of the organization, Lipsky's administration was severely criticized for extravagant expenditures and unfortunate investments; at the 1928 annual meeting, there took place a struggle that was even more bitter. Mr. Lipsky finally triumphed when the opposition brought charges of dishonesty against him and his friends rallied to his support as a personal issue. Similar disputes characterized the meeting of the Fifteenth Zionist Congress at Basel, Switzerland, in the summer of 1927. It was in this city, 30 years before, that the official Zionist movement had been born, yet the scene was one of turmoil when the congress met. Attacks were made on the administration of the mandatory power (England) and on the decision to include non-Zionists in the Jewish Agency, which was to be the official representative of Jewry in the administration of Palestine. Weizmann received a vote of confidence, was reelected the president of the World Zionist Organization, and the scheme for the Jewish Agency was approved. The following persons were chosen members of the agency: Miss Henrietta Szold of the United States, Harry Sacher of Palestine, and Col. Friederick Kisch of England.

The settlement of Palestine by Jewish immigrants began auspiciously. Large tracts of land were purchased from the Arabs, the Rutenberg scheme for the electrification of the country was

put under way, a model town inhabited completely by Jews (Tel-Aviv), was laid out, schools and institutions were opened, but there was not enough statesmanship exercised. By 1926 it began to be seen that the country, in its still undeveloped economic state, was not in a position to support the population that was seeking entry. In fact, in 1927 a serious economic crisis threatened, and the Zionists were compelled to seek the assistance of the non-Zionists among whom, in the United States at least, were to be found the wealthier persons. There followed the creation of the Joint Palestine Survey Commission with the following leading non-Zionists on it as its members: Lord Melchett of England, Oscar Wasserman of Germany, and Lee K. Frankel, and Felix M. Warburg of the United States.

Late in 1928, the survey findings, prepared by a notable corps of economic experts, were released. They pointed to the necessity for rigorously controlling immigration and for the concentration of all energies on the economic life of the country. Among the latter activities were cited the need for the afforestation of more waste lands; the exemption from taxation for five years of all new farming enterprises; the encouragement of cooperative purchasing and marketing, protection of certain local industries by tariffs; the establishment of agencies for the encouragement of manufacturing in the country, the assumption by the Government of a larger responsibility in matters of health, the acceptance by labor of the principle that industry and agriculture can be encouraged only by the offering of a suitable return for capital invested. A minimum budget of \$5,000,000 annually was found to be necessary. The commissioners felt very strongly that a policy which did not allow of further development and the acquisition of new territory, the founding of new colonies and the initiation of broader economic schemes must be considered entirely unsatisfactory.

The commission called upon the Jewry of the world to assist in the redemption of the Jewish National Home. This report led to the declaration of peace between the Zionists and the non-Zionists, with the latter promising the financial assistance that was so sorely needed. The price to be paid by the Zionists was the inclusion, as full partners, of the non-Zionists in the new Jewish agency.

In the summer of 1929, meeting at Zurich, the Sixteenth World Zionist Congress formally accepted the pact, though not without many misgivings on the part of the individual members. Many felt that Zionism was being surrendered to the non-Zionists, who for years had fought the idea of Jewish nationalism. The labor representatives feared the domination of American capitalists. Others thought that the appearance of the Agency would mean the decline of the authority of the World Zionist Congress. A feeling was general that the American non-Zionists might not be able to fulfill their pledge of adequate financial assistance.

The Revisionists, the extreme nationalistic group, rather than accede to the Agency agreement, announced their withdrawal from the Zionist Congress; but despite all this, the Congress gave its president, Chaim Weizmann, carte blanche with respect to the Agency arrangements simply because the Zionist Organization was at the end of its rope as far as fund-raising was concerned. It would appear that even Zionism had been compelled to capitulate to philanthropy.

The final ratification of the Agency pact took place also at Zurich in August, 1929. Its establishment meant the submergence of the American Zionist group, for in point of representation they were allotted fewer seats than the American non-Zionists. The Council of the Jewish Agency closed its sessions with the election of Baron Edmund de Rothschild as honorary president, Chaim Weizmann, president; Louis Marshall, chairman, Lord Melchett, associate chairman, and Felix M. Warburg, chairman of the administrative committee. Steps were taken toward the formation of an economic corporation to bring more capital into Palestine with the subscription of \$500,000 each by Lord Melchett and Mr. Warburg. The death of the leader of the whole movement in the rapprochement, Louis Marshall, in the fall of the year, made Mr. Warburg the outstanding non-Zionist of America and the person to whom the Jewish world looked for the fulfillment of the pledge that the economic rehabilitation of the country would be realized.

It was not going to be an easy matter, as the events of the late summer at once indicated. Beginning on August 23, sporadic attacks by Arabs on Jewish settlements, that increased in intensity and that met with vigorous defence by Jews, threw the whole Zionist situation before the world's attention. The British Palestine government was slow to start and for a time it seemed that the whole of the Near East would break into flame. It was not until September 7 that British forces had the situation in hand. By that time, the number of slain had reached more than 200 and the number of wounded 300, more than half the casualties being Jewish.

Beginning in Jerusalem, the disorders had spread to Hebron where an attack on the rabbinical college resulted in the death of 70 Jews. Safed suffered similarly. Here, 20 persons were killed and homes were looted and burned. Though the massacres were precipitated by the dispute over the use of the Wailing Wall in Jerusalem, a holy place sacred to both the Jews and the Mohammedans, the uprising was undoubtedly political in origin. The Jews were buying Arab lands at high prices; they were building roads, reclaiming waste areas, and developing the natural resources of the country, then public health measures redounded to the benefit of Arabs, as well as Jews.

The Arabs, sought, however, to make Palestine an Arabian land with a legislative assembly made up for the most part of Arabs. They were interested in exactly the sort of nationalistic aspirations that the Fourteen Points had given the stamp of approval to. The fact is, religious and racial differences had nothing to do with the ill-feeling, for Arabs and Jews had lived together in amity in the Near East during all those centuries that Jews were being persecuted in Christian Europe, but the Arabs sought: 1. The revocation of the Balfour Declaration. 2. Restriction of Zionist immigration to Palestine. 3. Establishment of a national representative assembly. 4. The administration of all the holy places according to the *status quo*.

The Jewish position centred in these contentions. 1. The political discontent was due to the agitations of a small band of self-seeking malcontents. 2. The great majority of Arabs and Jews were living in peace. 3. The economic betterment of the country was benefiting the Arabs. 4. Jews had a right to Palestine because of their long historical connection with the land. 5. The

Balfour Declaration was a clear-cut pledge that could not be disowned. 6. The British Palestine government had in many important matters, such as employment policy, taxation, and budgetary allotments, favored the Arabs.

England's position was difficult. The MacDonald government, while it was indicating its intention to get out of Egypt and Iraq, and in the face of a strong public opinion that demanded the relinquishment of the Palestine mandate, announced that it would stand by the Balfour Declaration. There were decided evidences that the imperialism that Joseph Chamberlain had fathered was being abandoned as no longer necessary for the prosecution of foreign trade and the exploitation of backward markets. Great Britain appeared to be desirous of liquidating its Near Eastern policy. To stay in Palestine, because of the Jews, would mean a danger spot in British foreign affairs, but late in 1929, Great Britain was still committed to staying. A commission of inquiry was sent to the country, trials were immediately called for those arrested for murder and robbery, and the local government began to feed the Jewish refugees. In a month, American Jewry contributed almost \$2,000,000 for the relief of the Palestinian sufferers.

All this was bound to have serious repercussions on Zionism. The collection of emergency funds was bound to harm cultural programmes and the University budget already seemed to suffer. Differences of opinion with regard to tactics soon resulted in divided councils. The Revisionists withdrew from the World Zionist Congress because of the mildness of the policy being pursued, among other reasons. In November, 1929, Chancellor Judah L. Magnes of the Hebrew University precipitated a storm when he favored the creation of a representative assembly and began private conversations with certain Arab leaders to effect this result. Most serious of all, the world at large was again weighing the pros and cons of nationalism and many persons were deciding that yielding to nationalist aspirations, which precipitated all sorts of crises, was not quite worth the candle. In short, Zionism was bound to suffer as opinion strengthened that nationalism had about run its course with the signing of the Peace Treaties. See PALESTINE, JEWS AND JUDAISM.

ZIPS. See TESCHEN, ZIPS, AND ORAVA QUESTIONS.

ZIVKOVITCH, PERA Z (?-). A Serbian soldier who was appointed military dictator of Yugoslavia by King Alexander on Jan. 6, 1929, and Premier and Minister of the Interior in the cabinet named by the King at the same time. He was a general of division in the Yugoslavian Army and commander of the Royal Guard. He adopted severe measures against the Croat autonomist movement and in the months following his appointment numerous Croat leaders escaped in disguise to other European countries in an effort to arouse sympathy with their protest against Serbian rule. In October, 1929, it was unofficially announced that the King planned to terminate the dictatorship with the proclamation of a new constitution early in 1930.

ZONING. See CITY AND REGIONAL PLANNING.

ZOOLOGY. Since Neolithic man had a considerable number of domesticated animals, it may be said that the study of zoology began very early in human history, and during the following centuries man must have accumu-

lated considerable information concerning the structure and habits of the animals which he encountered. Of these earlier observations, naturally, no records are preserved except insofar as they became incorporated in the folklore and tribal histories of the race, and zoology as a science begins with the work of Aristotle (384-322 B.C.) in his *History of Animals*. This *History* is a compilation of what was known about animals up to that time combined with the results obtained by the large number of field naturalists whom Aristotle was able to employ through the financial assistance given him by Alexander the Great. In addition, and this gives the *History* the character of something more than a mere compilation of information, Aristotle attempted a classification of animals, in which he arranged them in groups based on their structural agreements and differences.

In the following centuries, zoology shared in the fortunes of the other sciences, showing advances when freedom of thought and investigation were allowed, and a degeneration into mere repetition of traditional dogmas when, as in the Dark Ages, conditions were unfavorable for independent investigation. During most of this time, zoology was closely bound up with medicine; anatomy was of much importance to physicians, and many important advances in zoology were made by them. By the middle of the eighteenth century, a considerable body of information had been accumulated, but this was in a very chaotic condition. Notable as the first successful attempt to reduce these facts to some order is the work of Linnaeus (1758) to whom we largely owe the concept of a "species," as well as the system of nomenclature for species universally employed since then. The Linnaean concept was that at some time in the past there were independently created pairs of individuals, male and female, differing from all other animals in certain definite structural characteristics, and that the descendants of each pair retained from generation to generation the essential specific characters given to their first parents at the time of their creation. Linnaeus noted further that the differences between species are not uniform but greater in some cases than in others, the dog and the fox, for example, resemble one another much more closely than either resembles a cow, so it is possible to arrange species into groups of a higher order, the species in each group resembling one another more than they resemble species in any other group. Each of these higher groups he called a genus. According to Linnaeus, this grouping of individuals into species and of species into genera was a part of the original plan of creation. For convenience of reference, he proposed to give each animal a double name, of which the first word should indicate the genus, the second the species, to which it belongs. Thus the scientific name of the dog, *Canis familiaris*, indicates that it belongs in a genus *Canis* to which also belong the fox and the wolf, while its structural differences from them are indicated by its assignment to a distinct species, *familiaris*. This "binomial" system proved to be a tool of the greatest importance for the zoologist, and, in the century following Linnaeus, an immense number of genera and species were described and named. On the assumption that each of these species represented a distinct act of creation, this recognition and description seemed a sufficient end in itself.

The next date to be considered is 1859, when Darwin published *The Origin of Species*, and the universal acceptance of the evolution hypothesis which followed completely revolutionized zoology. Belief that animals have a blood relationship to one another naturally made the recognition of boundaries between species seem of less importance, and taxonomy, or the classification of animals, accordingly fell more or less into disrepute, while morphology, combining the study of adult structure with the embryonic history of the individual, became the chief line of investigation. See below, *Embryology*.

The next important change in the point of view of the zoologist was the development of the experimental method. No precise date can be assigned to the beginning of this development, but during the last two decades of the nineteenth century and through the first quarter of the twentieth, there has been an increasing use of this method, so that, from being largely an observational science, zoology is rapidly becoming experimental. New fields of research have been opened up, each demanding its own special technique, its own vocabulary, and in many cases its own special journals, so that at the present time few zoologists are able to claim intimate acquaintance with more than a very limited portion of the field. Points of contact also have been established with other sciences. The zoologist interested in the study of heredity finds that his interests lie very close to those of the botanist working along the same lines, and he is apt to affiliate with the latter rather than with zoologists in general; this new affiliation he calls a society of geneticists. (See HEREDITY.) In another direction, the zoologist finds that chemical reactions accompany and probably cause certain life activities, and to understand these he must affiliate with the biochemist. (See BIOCHEMISTRY.) In still other directions, the zoologist finds important openings for research along economic lines, as in the relations, especially among the protozoa and the insects, to the causation and transmission of disease, or in the control of plant-feeding insects which offer a serious problem to the agriculturalist. As a result, zoology at the present time may almost be considered a group of closely related sciences rather than a distinct science. In all of these, there is the unifying principle that all living matter is in the last analysis composed of protoplasm having similar structure and subject to certain fundamental laws wherever it occurs. It will be convenient to consider separately some of the more important of these subdivisions.

Taxonomy. This is the classification of animals. According to the older notion, species are independent created groups. According to the theory of evolution, they are related to one another in that they all have descended from a common ancestor, and the degree of structural resemblances between them is, within certain limits, an indication of the nearness of that relationship. Working on this hypothesis, it is obviously of less importance than was formerly thought that we should endeavor to trace the limits of species, the knowledge of a few thousand specific names is no longer the mark of a great zoologist, and taxonomy has lost its relatively high position among the subdivisions of the science. Where taxonomy still has valuable work to do is in determining the arrangement of animals according to their relationships,

and in describing new forms which are constantly being discovered.

While it is difficult to formulate an adequate definition of species, no one doubts that groups exist to which this name properly applies, and it seems certain that differences of a fundamental nature (possibly chemical) underlie these visible external differences which are found among species. If this be true, it follows that the experimental zoologist should know the species with which he is working, and that a confusion of species may introduce as many errors into his results as would follow the use of impure reagents by a chemist. As an illustration of the practical value of the work of the taxonomist may be cited the case of the sanitarian interested in the control of insect-borne diseases. Yellow fever is carried by one genus of mosquitoes and malaria by another, while a third is harmless so far as disease-carrying is concerned. Obviously, an accurate diagnosis of these genera is essential to the sanitarian, and for this information he must look to the taxonomist.

In modern classifications, the entire animal kingdom is divided into a series of phyla. As might be expected from the theory of evolution, some animals have developed along peculiar lines so that their relationships to others are obscure, and they are grouped differently by different taxonomists; but aside from some minor differences of this sort there is general agreement as to the following classification:

Phylum Protozoa	One-celled animals.
Phylum Porifera	The sponges
Phylum Coelenterata.	Hydra and hydroids, jelly-fish, and corals
Phylum Plathelminthes	The turbellarians, liver flukes, tapeworms, and nemertans
Phylum Nemathelminthes	The threadworms, trichina, hookworm, etc.
Phylum Trochelminthes	The rotifers.
Phylum Annulata	The segmented worms, earthworm marine annelids, leeches, and cephyranns.
Phylum Molluscoidea	The bryozoa and brachio-pods
Phylum Arthropoda.	Crustacea, insects, spiders, scorpions, and centipedes
Phylum Mollusca	Clams, snails, and cuttle-fishes
Phylum Echinodermata.	Starfish, sea urchins, and crinoids
Phylum Chordata.	Balanoglossus.
Subphylum Enteroptneusta	The "sea squirts" and tunicates
Subphylum Tunicata	
Subphylum Cephalochorda	Amphioxus
Subphylum Vertebrata	Vertebrate animals.

Each phylum is further subdivided into classes and these into orders, etc. For the smaller subdivisions, the reader should consult textbooks. See below, *Bibliography*.

Physiology. This is a study of the functions and activities of the organs of the animal body, and thus a dynamic, as distinguished from the purely static, study of anatomy. Originally quite distinct from zoology, except in so far as a knowledge of the structure of an animal is an essential preliminary to a study of its activities, the distinction between the two has largely disappeared with the development of the experimental method. When the embryologist applies the experimental method to the analysis of the process of fertilization of the egg or the form-changes going on in the developing embryo, he is using the methods of the physiologist. The physiologist must, on the other hand, rely on the biochemist for aid in answering many of his problems, thus these three meet here on common ground. Important contributions of physiology

to zoölogy are, first, the study of the enzymes, a series of organic substances which seem to be similar to if not identical with the catalytic agents of the chemist and which accompany most if not all of the fundamental physiological processes. This similarity to catalytic agents in their mode of working has led to the belief that they are practically the same, and thus that life is merely a series of these catalytic activities. This leads to the mechanistic conception of life as really nothing but a physicochemical process, a theory opposed by the vitalistic school, who hold that the regulative powers possessed by animals and often exhibited in their ability to adjust themselves to new and unusual conditions indicate the presence of a regulative mechanism independent of any chemical or physical activities going on in the protoplasm. This regulative mechanism is admittedly beyond the reach of any scientific analysis, but the vitalist believes that, without the assumption of its presence, it is not possible to explain animal activities. At present (1929), it seems probable that the mechanistic hypothesis is the more generally held, though some believe that "emergent evolution" offers a solution of the problem, as occupying a satisfactory middle ground between the extremists of both positions. See *Bibliography*, below.

Another physiological contribution, of especial importance in medicine but having definite applications in zoölogy, is the discovery of the important part played by the glands of internal secretion, i.e., the endocrine glands. The presence in the animal body of gland-like organs possessing no definite ducts has long been recognized, and they have generally been grouped together as the "ductless glands." Until quite recently, then, function was largely a matter of conjecture although it was recognized that disease of these ductless glands was correlated with definite bodily defects. It is now known that some of these glands, possibly all, secrete into the blood, substances known as "hormones" which are carried by the blood to other parts of the body and which govern the proper development or functioning of those parts. Thus, if the pituitary body does not send off the proper amounts of its peculiar hormone an abnormal development of the skeleton results. The development of a tadpole into a frog may be prevented by removing the thyroid from the tadpole, while on the other hand metamorphosis will be hastened if extra thyroid material be fed to the animal. The development of secondary sex characters at the time of puberty seems to be dependent on the hormones formed in the maturing sex organs at this time and discharged into the blood to be carried to other parts of the body; the effects of castration or removal of the sex organs in hindering the development of secondary sex characters are due to the loss of the hormones caused by the operation. In addition to hormones which produce these easily recognizable characters, evidence is accumulating which makes it seem probable that any organ in the body is capable of producing hormones which may exert some influence on any other organ in the same body. This possibility has been considered in recent discussions of the inheritance of acquired characters (see HEREDITY), for experimental evidence has been presented to show that changes set up in certain organs may produce changes in the sex cells through the action of hormones and in this

way may set up changes in the next generation.

The widespread phenomenon of luminescence in animals has evidently been solved by physiology. A large number of animals, of which the firefly is the most familiar example, are able to produce light often of very considerable intensity, a form of light production different from any artificial methods known to man in that there is no appreciable loss of energy as heat. This has made the study of animal luminescence of interest to practical engineers, in the hope of applying the method to the problem of reducing the cost of the present wasteful methods employed in all artificial lighting. It has been shown that animal light production is due to the oxidation of a substance called luciferin, apparently a protein, by the action of luciferase, an enzyme. This light in the firefly is used as a sex call, while some deep-sea fishes seem to employ it as a flash light to illuminate the dark bottom of the ocean or to attract other animals on which they feed.

Tropisms. The study of animal behavior is of interest from two points of view. One is that of the ecologist who considers the purposive character of many animal activities and the way in which these activities relate the individual to its environment, the other that of the physiologist whose problem is to explain the mechanisms employed in these processes. An influential school of physiologists explain animal behavior by the theory of tropisms. As a starting-point in the exposition of this theory, we may follow Jacques Loeb, who until his death in 1924, ranked as its leading exponent, in calling attention to what are known as "forced movements," or peculiar behavior shown by animals in which a portion of the brain is injured or diseased.

If food be held at a distance in front of a normal dog he will, naturally, go directly toward it. If this experiment is repeated on a dog in which a portion of one cerebral hemisphere has been removed, he will no longer go directly toward the food, but in attempting to do so, will continually turn toward the injured side and thus will move in a circle. The explanation is that while in the normal animal forward movement is produced by the equal contraction of the leg muscles on the two sides of the body, these equal contractions in turn being due to equal stimuli reaching them from the two cerebral hemispheres, in the injured animal, stimuli from the abnormal part of the brain are more or less suppressed and so lead to a lesser stimulus on one side than on the other. As a result, the stronger leg movements on one side bend the body toward the injured side. The animal does not circle from any desire to do so, but because if it moves at all its muscles force it to go in this direction.

In the well-known tendency of some insects to go toward a light, the tropism theory recognizes a precise analogy to the forced movements of the injured dog. If the common fruit flies, *Drosophila*, are put in a tube and the tube turned so that only one end is lighted, or one end turned toward the window so that light rays strike that end before they do the other, the flies, if they move at all, will go directly to the end toward the light. If the tube is turned through 180 degrees, they will again go toward the lighter end. According to the tropism interpretation, these movements are produced as follows: If the insect is facing the light at the be-

ginning of the experiment, light rays fall with equal intensity on the two eyes, equal stimuli are sent from the eyes to the central nervous system and from there to the leg muscles, the muscles of the two sides are equally stimulated, and the animal moves directly forward. Should the insect be standing so as not to face the light directly, one eye will receive a stronger stimulus than the other, this unequal stimulus leads eventually to a stronger contraction of the muscles on one side of the body than on the other and thus turns the body toward the less stimulated side. As the body is turned, the eyes are eventually brought to a position where they receive stimuli of equal strength, and the animal then moves toward the direction of the light rays. This is then a forced movement resulting from the action of the light rays on the physicochemical make up of the animal's body and has nothing analogous to an intelligent desire to go to the brighter region. Similarly, the moth, when it flies into a candle flame, does so because the physicochemical composition of its body responds in a precise, mechanical fashion to light stimuli, and the moth if it moves at all, is forced to go in that one direction.

In the illustrations given, the tropism is known as "positive" because the animal moves toward the source of the stimulus. Other animals show a "negative" tropism in that under these same conditions they collect at the place farthest from the source of the stimulus. A reversal of this tropism may appear, however, in that a "positive" animal may become "negative," and vice versa. This reversal was explained by Loeb as due either to a modification of the photochemical processes or to an effect on the nervous system and may be experimentally produced in the laboratory by subjecting the animals to chemical or mechanical treatment. It also frequently occurs in nature as when the larvae of a barnacle are strongly positive to light at the time of hatching and become equally strongly negative when they are a little older. This reaction to light is called heliotropism. Other tropisms are known as chemotropism, galvanotropism, thermotropism, rheotropism, anemotropism, stereotropism, and geotropism, according as the stimulating agent is chemical, electrical, heat, current of water, current of air, contact with solid bodies, or force of gravity. The responses of animals to these various stimuli are frequently quite marked and are all, according to the tropism theory, purely forced, mechanical movements resulting from the stimuli acting on the physicochemical composition of the complex of structures making up the body of the animal.

Some experiments on insects are difficult to explain on this theory. According to it, the constantly acting influence of the light rays keeps an animal turned in the proper direction, and, so to speak, steers it in the way it should go, but a firefly on receiving a flash from his mate will turn and go directly to her, even though the flash is but temporary in duration and the greater part of his journey is carried on in the dark. This observation was recorded by Mast, who also, as a result of a reexamination of the "orienting" reactions of insects, has concluded that even in these cases the effective stimuli are not symmetrically applied as the tropism theory maintains, and the process of adjustment is really a reflex action. A similar explanation would be given of all the other tropisms. Students of behavior also, notably those who have

worked with the higher *hymenoptera* such as the wasps, are generally agreed that it is impossible to explain their activities as tropisms, in the sense in which the word has been defined above. The term tropism with the appropriate prefix is convenient as a descriptive term and is often so used without necessarily implying the tropistic interpretation of the mechanisms employed. In the recent development of physiology, this tropistic concept has been of very great value as a stimulus to investigation, and its importance as such would not be lessened even if its final conclusions were overthrown.

Sex Determination. For practical as well as sentimental reasons, the subject of sex determination has received an immense amount of attention. The breeder of cows or the breeder of chickens for egg production could greatly increase his profits if he could control the sex of his animals so as to produce a large excess of females, and in human society desire is often expressed for offspring of one sex rather than another. The generally accepted explanation at the present time is based on the number of chromosomes in the sex cells. In the nucleus of each cell in the body is a substance called chromatin, which, at the time the cells divide, groups into bodies known as chromosomes. The number of these chromosomes is constant in any one species and is generally even. The exceptions to this rule are where in a number of animals one sex is found to have regularly one more chromosome than the other. In the best-known cases, those of some of the insects, the female has an even number and the male one less, or an odd number. Ordinarily, the chromosomes occur in definite pairs, and this odd one, in the case cited, is recognizable as equivalent to one of a certain pair in the female. These are known technically as the "X" chromosomes, so that the female has two X's, the male only one. In other cases, the number in the male is even, due to the presence of a "Y" chromosome, which, however, does not act as a mate to the X, so that, so far as the X is concerned, its presence or absence is a matter of indifference. In the peculiar series of processes known as maturation through which the sex cells pass before they unite, division is such that each mature egg cell contains only one X, while among the spermatozoa one-half have one X, and the rest have none. If a spermatozoon with one X fertilizes an egg, the result is a cell with two X's, and a female results. If the egg is fertilized by a spermatozoon having no X, the resulting individual is male. If this explanation is correct, it follows that sex is determined at the time of fertilization of the egg and not by later agencies operating on the developing embryo. In some other animals, this chromosomal action is reversed in that it is the male who has the even number, one more than the female. Recent work indicates that this is not due either to a greater or less quantity or to peculiar quality of the X chromatin but rather to a certain proportion between the number of chromosomes and the other chromosomes or "autosomes." Observations by Bridges on the fruit fly show a positive correlation between the varying numerical proportions of these two kinds of chromosomes and the normal and abnormal sex condition in the adult flies.

Crew has recorded the case of a hen which laid fertile eggs in a normal fashion but which, with advancing age, developed rooster plumage

and functional male sex organs and became the father of a brood of chickens. This indicates that while sex determination by the X chromosome may be the ordinary method, this determination is not irrevocable, but may be upset by later occurring conditions.

Embryology. Reproduction in animals is accomplished by both asexual and sexual methods. In the former case, there is either a growth of a bud from the surface or a division of the body into two parts, followed by a growth of the bud or separated portions until the full adult size is reached. Sexual reproduction is the development of a new individual from a specialized cell, the ovum or egg, derived from the ovary of the female, and this egg either develops without further treatment, a condition known as parthenogenesis and of frequent occurrence among insects, or as in the vast majority of cases, fuses with a spermatozoon derived from the testis of the male, and thus product, the fertilized ovum, is the starting-point of the new individual. By repeated divisions of this fertilized egg and its descendant cells, a many-celled body is formed in which differentiations arise, and finally the completed animal with its complex of organs appears. Observations on the developing embryo in the hen's egg are easily made and were described as early as 1621 by Harvey, whose dictum, "*Omne ovum ex ovo*," dates from this time. The foundation of modern embryology was laid by von Baer, who discovered the mammalian ovum in 1828. In his completed work, published in 1834, von Baer demonstrated the existence of the primary "germ layers" which occur in all of the metazoa. In this same work, he announced the discovery, since known as von Baer's law, that in passing from the egg to the adult state the embryo of a higher form goes through stages in which it resembles the embryo of lower forms.

Louis Agassiz pointed out that in thus passing from the one-celled egg to the adult condition, an embryo passes through a series of stages in which it resembles a series which would be formed if we arranged adult animals in order of increasing structural complexity from the simple protozoa to the higher metazoa, and he argued that thus and the series of von Baer were prearranged by the Creator at the beginning in order to demonstrate his plan of creation. A different interpretation was later put on these facts by the evolutionists, who recognized in these series of embryonic stages a recapitulation of the ancestral history of the race. The German zoologist, Haeckel, was the most prominent advocate of this theory, and largely through his influence it was generally believed that a fairly accurate history of the ancestry of an animal could be obtained through a study of its embryonic stages. During the seventies and eighties, this belief was the inspiration of a great deal of descriptive embryology, but this phase of the subject has been very largely given up, partly because of the discovery that many embryonic characters are newly acquired and not ancestral, and partly because of the shifting of interest to the experimental method. This law of von Baer is by no means abandoned, but embryologists generally recognize that its application is limited to more generalized characters and does not extend to the finer details.

By the end of the nineteenth century, embryologists were divided into two groups, descriptive and experimental. The descriptive embry-

ologists, following the lines laid down by von Baer, were studying with constantly improving technique the normal development of animals and had accumulated much information of a purely descriptive character. A speculation as to the real composition of the fertilized egg arose from this work. The egg appears to be perfectly homogeneous, but out of it, after repeated divisions, arises a differentiated body. Is the homogeneity merely apparent and does the egg contain materials of different kinds which are separated from one another by the division processes, or is it real and does differentiation depend on the position of the cell in the complex and its relation to surrounding cells? One answer to the question was sought through the method of cell lineage. This consists in following the developing egg cell by cell until different regions or organs of the adult body are outlined. From learning in this way the origin and fate of each cell, it was found that in many cases the pattern of the cleavage is so regular and the relation of certain cells to certain organs so definite and certain as to indicate that cleavage is really a separation of different kinds of material from one another. In some animals, this conclusion seems the more certain, because from the beginning certain portions of the eggs differ from the remainder in color and apparently follow definite and prearranged paths until they give rise to definite organs in the new individual. Even where there is not this visible distinction, the regularity of the divisions indicates a similar, though invisible, condition.

A second line is more definitely experimental. Developing eggs are mutilated in various ways, as by the separation of the cells from one another in the early cleavage stages, and a study is made of the behavior of the resulting separated blastomeres. Others are treated chemically in such a way as to alter the osmotic pressure or the chemical nature of the environment. In this fashion, an experimental analysis of the forces at work in and on the embryo may be made. In later stages, operative interference with normal developmental processes is employed for the same purpose. These later methods are such as removing the spinal cord of an amphibian embryo and replacing it end for end, or removing arms from similar embryos and grafting them into other parts of the body. The general purpose of all of these experiments is to secure data bearing on the question of how far an organ is self-differentiating, and how far its differentiation is a result of influences brought to bear on it from neighboring organs. For a discussion of the results obtained by these experiments, consult titles given in the bibliography.

Some eggs, as in many insects, develop parthenogenetically, while others normally require fertilization by a spermatozoon. In many eggs of this latter type, it has been found possible to induce parthenogenesis by artificial means. The agent employed may be a change in the chemical composition of the surrounding medium, for example, adding certain chemicals to the water in the case of water-living animals, or by mechanical means such as shaking, and Loeb succeeded in producing parthenogenetic development in the frog up to sexually mature individuals by simply pricking the egg with a needle. It would appear that one function of the spermatozoon is to stimulate the egg to develop, and this function may be replaced by other agents. There is reason to believe that, even in the mechanical stimuli, a

chemical change is the ultimate cause of the development, and Lillie has recognized this chemical process in the working of a substance called fertilizin which is secreted by the egg and which when it comes in contact with a spermatozoon sets free a substance acting as a stimulus to development. Loeb, on the other hand, considered that anything which can produce an egg membrane is an efficient stimulus and will start the developmental process.

Histology. With increasing perfection of microscopic technique, anatomists studied more and more thoroughly the finer details of animal and plant structure, and this microscopic investigation eventually developed into a distinct subdivision of anatomy called histology. This concerns itself very little with the structure of protoplasm or of the undifferentiated cell but deals mainly with the differentiated condition of cells as they appear in combination to form the various tissues of the body. This study may be directed toward the normal structure of tissues, or it may deal with their appearance under abnormal or diseased conditions. In the diagnosis and treatment of many diseases, a comparison of the normal with the diseased condition is often of very great practical importance.

Cytology. More recently, cytology, or the division of microscopic anatomy which studies especially the undifferentiated protoplasm and the structure of the simple cell, has received especial attention. While the earlier cytologists thought they recognized visible structures in protoplasm, the later tendency was to regard most of these structures as artefacts or abnormalities resulting from the manipulation to which the material must necessarily be subjected in order to study it, and to think of protoplasm as a complex colloidal compound which may in whole or in part change from a sol to a gel condition and back again, these changes being in some way connected with the life manifestations of the protoplasm. Two kinds of material are recognizable in the cell, the nucleoplasm inside and the cytoplasm outside of the nucleus, differing from one another in their physicochemical composition and containing different kinds of materials. In the nucleus is the chromatin which has been shown to have very great importance in the life of the cell and is an important agent in the transmission of hereditary qualities. More than any other portion of the cell, the behavior of this chromatin during cell division by mitosis has attracted the attention of cytologists. Still later, attention was turning to the study of cytoplasmic inclusions known as chondriosomes and Golgi apparatus, structures which lie in the cytoplasm and which, owing to concentration of attention on the chromatin, were largely ignored by earlier cytologists. Opinions differ as to whether these are merely temporary structures in the cytoplasm or permanent organs with some possible function in heredity.

Ecology. This is a study of the living organism in its natural environment with especial reference to the reasons why it should be in that environment rather than in some other. In the environment of an animal would be included climatic conditions, chemical composition of the water or soil in or on which it lives, location of its food, presence or absence of enemies, and conditions governing mating and care of the young. Adams divides the subject into three aspects: individual, in which a particular kind of animal is studied throughout its range of distribution;

aggregate, where the taxonomic unit or family is traced throughout its early history; and associational, in which the animal or group of animals is studied with reference to its association with other organisms. Ecology as thus defined has received little consideration as compared with the amount of research devoted to morphology, embryology, and physiology. A rather cheap criticism, frequently expressed in this connection, is apparently based on the assumption that studying an animal under a microscope or in a laboratory in some way alters its character, so that what is there seen is unnatural and abnormal. The absurdity of this extreme position is sufficiently obvious, but it is certainly true that the point of view of the old-time naturalist has been too much ignored and that its reappearance under the newer name of ecology is a sign of progress.

It seems probable that associational ecology offers the most interesting field. A study of this sort would include, first, a list of the species of animals and plants living in a given locality, and then a consideration of the various factors that have brought them together. The climatic and the soil conditions would be of much importance, but the main interest would lie in a study of the relationship existing between the component species of the association. These relationships may be hostile, as where one animal feeds on another; mutually beneficial or symbiotic, as in the case of the sea anemone earned on the shell of a crab, commensal, as in the small crab living in the oyster shell, where neither animal is benefited, or parasitic, where one lives permanently attached to the body of the other, or they may merely amount to an occupation of the same general territory without the animals having any very definite influence on one another. The breeding habits of component species would also be considered in reference to their modification through the association. It is not to be understood that in all cases definite and precise reasons can be assigned for the distribution of animals, for because of their locomotive powers their appearance in a given locality might be quite accidental. Carefully conducted observations should, however, separate the accidental from the definitely significant distributions. A study of this sort might cover a considerable area, or it might be quite limited, as for example, the ant colonies studied by Wheeler, where in a very restricted area associations exist between a considerable number of animals, and complicated ecological conditions result.

Death. A question to which biologists have devoted much attention is whether death is an inevitable and necessary process, or whether, given a continuous optimum adjustment of internal to external conditions, any organism might, barring accident, be immortal. Protozoa reproduce by transverse fission. The body of the parent divides into two, usually equal, parts, each of which in its growth comes to resemble the parent in size and form. Each of these later divides, and this is continued indefinitely, no portion of any generation dies unless by accidental injury. It is evident that in this process which began with the first protozoon and will continue to the last, we have a true bodily immortality. Further, Carrel has been able to keep portions of the heart of an embryo chick alive in artificial culture media for a period of several times the normal length of life of the fowl, and there seems no reason why this might not be continued indef-

nately. Similar results have been reported by others, and the conclusion must follow that there is nothing inherent in protoplasm itself which inevitably leads to senescence and death.

When, however, we combine these individually potentially immortal cells into a system of tissues and organs making up the body of a complex animal or plant, death appears as an apparently inevitable process at the end of a period which is, roughly speaking, characteristic for each race, although length of life varies in different families within a race and is undoubtedly an inherited trait. Several explanations for the senescence and death of many-celled organisms have been given, some referring them to changes in the relative sizes of nucleus and cytoplasm in the cell, others to a decrease, with advancing differentiation, of ability to assimilate nutrition and to eliminate waste, and still others to the fact that the combination of highly differentiated cells into tissues and their relations to one another make up so complicated a bit of machinery that failure to function normally in one part disorganizes the whole mechanism. It would appear, from any or all of these suggestions, that death is the price we pay for the differentiation of tissues making possible the efficiency of our highly organized bodies, and that had we been content to remain protozoa, we might all be immortal.

Economic Zoology. Important economic applications of zoology appear along both medical and nonmedical lines. Some protozoa cause disease, some plathelminthes and nemathelminthes are dangerous parasites, and some insects carry disease-producing organisms from one animal to another. These are obviously conditions of interest to physicians and sanitarians, who derive their information concerning the anatomy, life histories, ecology, and methods of combating these organisms from the researches of the zoologist, and the physician gets from the same source his knowledge of normal anatomy and embryology. Most of the nonmedical applications have to do with the production and preservation of man's food and clothing. Among the invertebrates, the most important are the insects, for while only a few of these produce food (e.g. the honeybee), and others material for clothing (e.g. the silkworm) a large number, which appears to be increasing, causes serious losses through their attacks on commercially valuable plants. An appreciable proportion of the cost of production of food and clothing is due to the expense involved in fighting the insect enemies of the plants from which these materials are obtained. In the United States, the boll weevil, the gypsy moth, the corn borer (to combat which a Federal appropriation of \$10,000,000 was made in 1927), and the Japanese beetle are striking examples of this situation. Less spectacular but similar problems arise in all parts of the country, and large amounts of money are spent annually in attempting to solve them, this work is largely under supervision of State and Federal entomologists to whom applications should be made for advice or assistance on any problems connected with insect control. See ENTOMOLOGY, ECONOMIC.

Similar work is under way in other countries, although insect pests seem to be much more numerous in North America than in any part of Europe. Other applications of economic zoology are in the propagation of edible mollusca, crustacea, fish, terrapin, etc.: in the study of fur-bearing animals, such as seals, and in devising

means of protection against predatory animals other than insects.

Bibliography. Recent works in this field are Parker and Haswell, *Text Book of Zoology*; Elton, *Animal Ecology*, Pearse, *Animal Ecology*; Morgan, *Experimental Embryology*, Rogers, *Text Book of Comparative Physiology*; Wilson, *The Cell in Development and Inheritance*; Loeb, *Forced Movements, Tropisms, and Animal Behavior*; Morgan, *Emergent Evolution*.

ZORN, tsōin, ANDERS LEONHARD (1860-1920). A Swedish painter and etcher (see Vol. XXIII). His exhibition showed a curious juxtaposition of portraits of men and women in irreproachable conventional dress and strikingly realistic nudes. He continued the production of etchings of the old technical excellence and produced several fine pieces of sculpture, including "The Broken Pitcher" (1920).

ZSIGMONDY, shīg'mōn-dē, RICHARD (1865-). An Austrian chemist (see Vol. XXIII). He invented the *Membrafilter* in 1917 and wrote *Lehrbuch der Kolloidchemie* (1920).

ZUKOR, ADOLF (1873-). An American motion picture producer, born at Riese in Hungary, and educated in Hungary and in the schools of New York City. He came to the United States in 1888. For several years, he engaged in business in New York City and Chicago and was later the owner of several vaudeville and motion-picture theatres in New York City. He founded the Famous Players Film Company in 1912 and later became president of the Famous Players-Lasky Corporation, and of its successor, the Paramount Famous-Lasky Corporation. Consult *The House that Shadows Built*, by Will Irwin (1928).

ZURICH. The capital of the Canton of Zurich and the largest city in Switzerland. The population in 1927 was estimated to be 215,460. Zurich is the centre of Swiss industry and commerce, the manufacture of silk, cotton, and machinery being its principal industries. It is also the junction of the great international railways connecting France, Germany, Austria, Hungary, Italy, Belgium and the Netherlands. With the development of aviation it has taken its place as an international air-traffic centre. In 1928 the military landing field of Dübendorf was enlarged by the purchase of land and construction of buildings, together with the installation of modern airport equipment, so that in the future it would be large enough for both civil and military use. In 1911-14 a new building was erected for the University of Zurich; it has two main wings connected by a massive square tower 215 feet high. In 1929 plans were announced for the construction of a new stock-exchange building at a cost of approximately \$675,500. The Swiss Social Museum and the Pestalozzianum, an educational exhibition pertaining to the work of Johann Heinrich Pestalozzi, the famous Swiss educator, have been accommodated since 1927 in the Beckenhof.

ZWEIG, STEFAN (1881-). An Austrian poet, dramatist, critic, and translator, who was born in Vienna and studied philosophy at the university there. Among his works are the poems *Silbene Saiten*, the tragedies *Thersites* (1901), *Jeremias* (1917); the stories *Erstes Erlebnis* (1911), *Verwundung der Gefühle* (1926, in English trans., *Conflicts*, 1928), essays on *Verlaine*, *Verhaeren* (translated into English), *Romain Rolland* (1920), *Erinnerungen an Verhaeren*, and the series *Baumeister der Welt*,

containing studies of Balzac, Dickens, Dostoevski, Hölderlin, Nietzsche, Kleist, Casanova, Stendhal, and Tolstoy. The last three studies were published in English in 1928 under the title: *Adepts in Self-Portraiture*. He edited the life, *Marcelline Desbordes-Valmor*, *Sainte Beuve*, and *Literarische Charakterbilder*, and translated Baudelaire, Verhaeren, Romain Rolland, and others. He is becoming widely appreciated in America through his adaptation of Ben Jonson's *Volpone*, produced by the Theatre Guild of New York.

ZWEIG, ARNOLD (1887-). A German writer, born at Gross-Glogau, Silesia, who was educated for the teaching profession in the universities of Berlin, Munich, Rostock, Tübingen, and Heidelberg. He published his first volumes of short stories in 1910 and in 1913 his play, *Ritual Murder in Hungary*, was successfully produced by Reinhardt in Berlin and throughout Germany and Austria. His experiences in the

German Labor Corps in Northern France, Serbia, and Macedonia during the World War were described in his novel *The Case of Sergeant Grischka* (1927, Eng. trans., 1928). His other works include *Drei Erzählungen* (1920); *Das neue Kanaan* (1925); *Pont und Anna* (1928); *Juden auf der deutschen Bühne* (1928). He also has translated works of Poe and Kipling.

ZWEMER, SAMUEL MARINUS (1867-). An American missionary, traveler, and author (see Vol. XXIII). In 1929 he was appointed to a professorship of Christian missions in Princeton Theological Seminary, Princeton, N. J. His later writings include *The Disintegration of Islam* (1917); *Influence of Animism on Islam* (1920); *A Moslem Sacker after God* (1920); *Christianity, the Final Religion* (1921); *Call to Prayer* (1923); *The Law of Apostasy in Islam* (1924).
